and consequently it keeps absolutely true to scale; with processes in which the print is immersed in water or other liquid there is the possibility of expansion, and cases might often arise where the slightest defect of this nature would render the print useless for practical purposes. It is to be noted also that papers which have been sensitized with some sort of gum as a ground are apt to produce slightly blurred lines, which is another defect. This "True-scale" process, then, being eminently satisfactory in result, the whole question resolves itself into one of cost. Here the number of prints required governs the situation, for the cost of the first print by this "True-scale" process is comparatively high, though subsequently copies are proportionately cheap. For example, the charge for a single print on an imperial sheet is 7s. and additional copies only 1s. each. The firm's price for similar sized sepia or gallic prints is 2s. each. Hence, if six copies were required the cost would be the same in each case, and there is no question as to the superiority of the "True-scale" process. Messrs. Vincent Brooks, Day & Son supply a little pamphlet giving samples of their work on paper, linen and tracing cloth, and we advise all who are interested to write for a copy. The firm's address is 48, Parker Street, Lincoln's Inn Fields, W.C.

Dovetail Sheet Construction.

We have received a new catalogue just issued by the Fireproof Co., Ltd., of 10, York Buildings, Adelphi, W.C., dealing with their dovetailed corrugated system of fire-resisting construction. This system is well-known, and its many advantages have been widely recognized. The chief feature is the use of sheets rolled into a dovetail corrugation, which offers an excellent key for plaster or concrete. By the use of these sheets thin partitions can be erected that have great rigidity and strength. The sheeting is manufactured of a special gauge steel sheet in three sections, namely—(1) Deep, $\frac{7}{16}$ in. deep; (2) shallow, $\frac{7}{16}$ in. deep; (3) extra shallow, $\frac{3}{16}$ in. deep.

Deep sections are made and stocked in the following sizes:—

Width.	Length.
3ft.	× 3ft. 4ins.
2ft. 6ins.	× 3ft. 4ins.
2ft. 6ins.	× 3ft. 4ins.
2ft. 6ins.	× 3ft. 4ins.
2ft.	× 3ft. 4ins.

For the erection of a partition all that is necessary is to fix to the ceiling (whether wood joists, concrete or other substance) a T section iron, by means of special pattern

hooks, and immediately under, on the floor, channel section shoes about 4ins. long, these being placed under each H upright. The H uprights $1\frac{1}{4}$ ins. by $1\frac{1}{4}$ ins. by $\frac{1}{2}$ in., or $1\frac{3}{4}$ ins. by $1\frac{1}{4}$ ins. by $\frac{1}{2}$ in., according to the height of the partition, are spaced according to the width of the sheeting being used. The H bar is slotted at one end in order to engage with the T bar fixed to ceiling. Between the flanges of H uprights are placed the dovetail corrugated sheets. The sheets being 3ft. 4ins. long, necessarily butt joint at intervals; each of these joints (on one side only of the partition) is clipped to the next with a small joint clip which prevents any likelihood of the sheets dropping with the weight of the wet plaster. To effect a tie from end to end of the partition hoop-iron bands, in. by 18 B.W.G., are employed from the H to H uprights alternately on either side of the partition about midway of the height (unless a high partition, then two ties in the height). These bands should not be placed on too tightly, but just sufficiently to act as a tie to the partitions.

Where a partition finishes against a wall, a channel upright is used and fixed to the wall by clout nails spaced about 3ft. apart. Where one partition forms a corner with another an H and a channel section-bar are used conjointly, the two uprights being jointed together with clips of in. by 18 B.W.G. hoop-iron. All other applications have been satisfactorily solved and are fully explained with drawings in the catalogue.

Coming Events.

Saturday, September 30.

NORTHERN ARCHITECTURAL ASSOCIATION. — Students' Sketching Club Excursion.

INSTITUTE OF SANITARY ENGINEERS. — Visit to Associated Portland Cement Manufacturers' works at Northfleet, at 3.20 p.m.

Wednesday, October 4.

KING'S COLLEGE, LONDON. — Course of Training for Sanitary Inspectors in Building Construction commences.

New Companies.

DAVISON & Co., Sanitary Engineers,
HEXHAM - ON - TYNE

Established 1798.

G. & A. BROWN, Ltd.,
167, HAMMERSMITH ROAD, W.

AND

85, NEWMAN STREET, W.,

Manufacturing Decorators in Plaster, Wood,
and Carton-Pierre.

Telephone: 1112 Hammersmith.

Advertising Notes.

The one-insertion advertisement brings replies from the "scattering few." Continuous hammering rounds up the profitable many.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

ABLE ASSISTANT (24½) seeks RE-ENGAGEMENT. Careful draughtsman.—F. B. HOOPER, The Hermitage, High Wycombe.

ARCHITECT and SURVEYOR'S ASSISTANT, with 10½ years' experience in design, details, specification, and quantities for first-class work, just disengaged, desires RE-ENGAGEMENT.—Z., 6, Hope Terrace, Matlock Bath, Derbyshire. 1377

ARCHITECT and SURVEYOR'S ASSISTANT requires ENGAGEMENT, 16 years' varied experience town and country. Eight years' Government appointment. Domestic, school, and hospital work.—Apply to H., Manor House, Northstoke, near Bath. 1378

ARCHITECT and SURVEYOR'S ASSISTANT (22½), P.A.S.I., requires ENGAGEMENT. 6 years' experience. Working drawings, quantities, surveying, &c. £100.—Box 1400, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT (A.R.I.B.A.) desires immediate RE-ENGAGEMENT in Provinces. Large varied experience good class Provincial work. Design, details and experienced Quantity Surveyor. Excellent testimonials. Very moderate salary.—"EXPERIENCE," Box 1380, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT (25) disengaged; nine years' experience; good draughtsman, working drawings, details, &c.; London or country.—W. A. N., 46, St. Augustine's Road, Camden Square, N.W. 1372

ARCHITECT'S ASSISTANT (24) disengaged; nine years' experience; good draughtsman, designs, working drawings, details, &c.; London or country.—W. H. L., 83, Elspeth Road, Clapham Common, S.W. 1374

ARCHITECT'S ASSISTANT (21) DIS-ENGAGED. Working drawings, all details, surveying, assist with quantities; experienced; excellent references.—Box 1402, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT, 20 years' general experience, desires TEMPORARY ENGAGEMENTS (Lancashire preferred) as Assistant. Expert designer, draughtsman, surveyor, quantities, perspectives, &c. Terms moderate.—Box 1399, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S JUNIOR ASSISTANT (21) desires SITUATION, free after 23rd September. Four years' experience. Advanced building construction certificate. Moderate salary.—C. E. H., 263, Broad Street, Birmingham. 1341

ARCHITECT'S JUNIOR ASSISTANT desires ENGAGEMENT in a good London office. Five years' experience; age 23. Good references. Salary moderate.—B. E. ATKINSON, Jun., 14, Rosslyn Hill, Hampstead, N.W. 1342

ARCHITECT'S JUNIOR ASSISTANT; six years' experience, five years' article; contract drawings, details, surveying and levelling. Excellent references present berth.—Box 1366, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S JUNIOR ASSISTANT, DIS-ENGAGED October 10th; Good draughtsman, colourist, &c.; mod sal.—H. J. C., 63, Edinburgh Road, Queen's Park, Northampton.

ARCHITECT'S JUNIOR ASSISTANT, 24. Good tracer and colourist, neat draughtsman. Prob. R.I.B.A.; 5 years' experience; salary 25s.—A. C., 46, King Henry's Road, N.W. 1381

ARCHITECT'S JUNIOR ASSISTANT desires a change. London or Provinces. 5 years' experience. Salary to be arranged.—A. G. S., "Kirkdale," Stanmore Road, Leytonstone, Essex. 1386

ARCHITECT'S JUNIOR ASSISTANT seeks ENGAGEMENT. 4½ years' experience. Good draughtsman, tracer, colourist and typist. Knowledge of quantities and specifications. Usual office routine. Lincolnshire or Yorks. preferred. Good references.—Box 1401, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

BUILDER'S CLERK.—Book-keeping, assisting Quantity Surveyor; abstracts, time-sheets, general routine; typewriter; excellent references.—P. H. G., 2, "Fernfield," Bonner Hill Road, Kingston-on-Thames. 1332

BUILDER'S CLERK, experienced, double entry book-keeping, time sheets, correspondence and general routine. Plans, &c. Town or country. Moderate salary.—E. W. H., 11, Archibald Road, Tufnell Park, N. 1348

HEAD DRAUGHTSMAN & DESIGNER, Falcene and Tile Trade, seeks ENGAGEMENT; 16 years' wide experience with a leading firm.—Box 1405, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

HOT WATER, GAS FITTER, and PLUMBER wants EMPLOYMENT. Good references. Abstainer.—Address, 34, Clinton Road, West Green, Tottenham, N. 1406

JUNIOR DRAUGHTSMAN (21) desires ENGAGEMENT. Working drawings, details, good tracer, colourist, &c. Five years' experience, general office routine. Moderate salary.—K., 7, Cornfield Terrace, Eastbourne. 1354

MACHINIST.—Band and circular sawyer, sharpens saws, planing machines, fourcutter; some experience in French spindle; could take charge of small plant; town, country, or would go abroad.—MACHINIST, 51, Somers Road, Walthamstow. 1344

MACHINIST, young, seeks situation on Sawbench or Planer; good refs.; wages mod. London or district.—A. A., Brooklyn House, Bell Lane, Hendon, N.W. 1305

PLASTERER wants WORK; day or piece or charge. Good references; 15 years' experience.—Box 1403, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

SURVEYOR'S JUNIOR ASSISTANT, 22, requires post in Borough Surveyor's office; holding public appointment, has served 3 years articles with Borough Surveyor. Country town preferred.—E. BURMAN, Ramsbury, Wilts. 1349

SHOP FOREMAN of JOINERS seeks RE-ENGAGEMENT. Capable, energetic, quick, and accurate setter out. Good manager of men. Accustomed to first-class joinery works. London or provinces.—W. H. T., 15, Barlow Street, Walworth, S.E. 1355

TO QUANTITY SURVEYORS.—JUNIOR ASSISTANT requires Engagement; abstracting and billing.—Box 1323, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

WANTED appointment in office by young Junior ARCHITECT and SURVEYOR; age 23; good experience; excellent references. Sal. £1 to 25s. per week.—Box 1364, BUILDERS' JOURNAL Office, 6, Great New Street, E.C.

WANTED by Practical Man, Brickwork and Pointing to any amount; first-class work guaranteed at reasonable price, or would take charge as working foreman, town or country; good refs., abstainer.—A. S., 1, White Hart Lane, Barnes, S.W. 1350

WANTED.—Situation as Foreman Carpenter or General Foreman. Age 43. Total abstainer; good references.—H. READ, 24, Kingsley House, Beaufort Street, Chelsea, S.W. 1408

YOUNG ARCHITECT just starting for himself is able to assist others.—G. W. M., 12, Muswell Road, Muswell Hill, N. 1353

YOUTH requires Situation with good firm of Builders and Contractors, in Liverpool or Manchester district, well educated and used to general routine of business. Mod. sal.—Box 1363, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Appointments Vacant.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

ARTICLED PUPIL.—Vacancy for same in old-established West-End firm of Architects and Surveyors. Moderate Premium.—Box 1382, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ESTIMATING and QUANTITIES.—Correspondence Classes in above (carefully revised to date) by an experienced Surveyor, specially adapted to suit the requirements of Builders' Clerks, Foremen, Leading Hands, and others. For terms and full particulars, write "Classes, Box 1," WILLING'S, 73, Knightsbridge, S.W.

VACANCY for PUPIL in builder's office. Business thoroughly taught. Premium.—ERNEST J. BOWLES, builder and contractor, South Ashford, Kent.

WANTED A YOUNG MAN who has had experience either in Architect's office or with firm of repute making terra cotta, to design and carry out constructional falence work.—Apply, stating qualifications and salary required to CRAVEN, DUNNILL & Co., Ltd., Jackfield, R.S.O., Shropshire.

WANTED.—Designer for Stained Glass and Leaded Lights. State terms, &c.—GRAVES GLASS Co., Brook Street, Lindow, Lancashire.

Drawings, Tracings &c.

DESIGNS for SUBURBAN RESIDENCES prepared to suit clients. Plans and Specifications for new work and alterations. Drain, Plans at specially low fees.—J. LAWRENCE, jun., M.R.S.I., A.I.S.E., 112, Shirland Road, W.

DRAWINGS from rough sketches, designs, details, specifications, drain plans and quantities PREPARED; terms moderate.—J. W., 8, Rylett Crescent, Shepherd's Bush, W. 1373

EXPERT DRAUGHTSMAN with own office undertakes perspectives, designs, and general architectural work. Moderate charges.—ARCHITECT, 754, Fulham Road, S.W. 1343

PERSPECTIVES effectively executed.—C. H. SIMPSON, 82, Ebury Buildings, Ebury Square, S.W. 1404

PHOTO PRINTS.—Drawings, Tracings, Perspectives, &c., prepared for Architects in any part of the country; moderate charges; samples on application.—Box 1351, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

QUANTITY SURVEYOR.—Quantities prepared, variations measured, &c., by experienced quantity surveyor. Terms by arrangement.—Box 1315, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Businesses Wanted & For Sale

ARCHITECT and SURVEYOR'S BUSINESS for DISPOSAL; efficiently fitted and splendidly situated on main thoroughfare of London suburb; would suit young architect; £50.—Box 1385, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECTS COMMENCING.—Architect retiring would make over business and offices on very reasonable terms. Rent £35; city.—C. E., 36, Westwell Road, Streatham Common.

Partnerships.

SURVEYOR, with 14 years' experience, wishes to take PARTNERSHIP in Surveyor's and Estate Agent's business, or would purchase small business.—Apply Box 1379, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Miscellaneous.

A. J. ARROWSMITH, 22, Mount Street, Berkeley Square, London, W. Wood Mantel-pieces, Panelling, and Parquet Flooring.

BOGNOR.—To Let, Furnished House (or Apartments).—Apply, FRENCH, "Lansdowne," Esplanade, Bognor.

BUILDER'S IRONMONGERY & MATERIALS.—Fine corner shop premises, Walthamstow; splendid opening; large yard, two cart entrances, good dry light cellarage; agreement or lease; £45, or freehold by instalments if desired.—Cocks, 19, East Street, Marylebone.

MARBLE AND GRANITE WORK.—Speciality, Shopfittings, Steps, and Monuments.—KELLY & Co., Masons, Mill Hill, N.W., also Kilburn N.W., and Harpenden, &c. Telephone, 1159 Hampstead.

POLING BOARDS, selected lengths and thicknesses (best quality and full measure).

Also Scaffold Boards, Putlogs, Scantlings, Deals, Battens, and Boards. Lowest wharf prices.

C. H. GLOVER & Co., Ltd., Importers, Hatcham Saw Mills, Old Kent Road, S.E.

TO BUILDERS.—465 feet of Ornamental Terra Cotta, suitable for front of house, stringing and sailing courses, windows, &c. A bargain.—106, Eastcourt Road, Fulham.

TURNED BALUSTERS, 1s. 9d. per doz. Red Deal Newells, 1s. 6d. each. Send for List and Samples. Agents wanted.—THE MIDLAND WOOD TURNING Co., 138, Suffolk Street, Birmingham.

WANTED Back Numbers of the "Architectural Review," dated May and July, 1902.—Box 1388, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

MONTHLY

FIRE SUPPLEMENT

TO THE

BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

Edwin O. Sachs, F.R.S.Ed., Architect,
Consulting Editor.

Number 12.
September, 1905.

THE SELECT COMMITTEE ON PROTECTION FROM FIRE.

WE mentioned recently that a Select Committee had been appointed by the House of Commons to enquire as to the provision of means of escape from fire in factories, workshops, laundries, offices, shops, hotels and other buildings where persons work or live in large numbers. This Committee was appointed at a time when the Select Committee on the fire-escape clauses of the London Building Act was sitting, and seeing that any legislation for the Metropolis must necessarily influence the question generally, and having regard to the fact that it was probable that the retrospective character of the legislation in this direction as far as London was concerned would create a precedent, the members of the Select Committee wisely limited their work of the past session to making their preparations for the next session without taking evidence. They have reported as a matter of fact that, in view of the late period of the session and the pending decision regarding the London Building Acts Amendment Bill, they considered they could not usefully take evidence during the past session, and they recommended their reappointment for the next session, when the law regarding the county of London would be in existence to go upon.

We have given the names of the members of this Committee in a previous supplement, and this list holds good with the exception that Mr. Guy Pym, M.P., was substituted for Mr. Ian Malcolm, M.P. Mr. Munro Ferguson was Chairman of the Committee. The only business of importance executed was a request to the Home Office to prepare a précis of the evidence given before the Committees of both Houses on the London Building Act.

Seeing that the Committee has now once been set up, and that preparations have been commenced, we trust that the Select Committee will be reappointed at the earliest possible date in the new session, for its field is a wide one, and the importance of the subject cannot be underrated.

Mr. Guy Pym, M.P., and Mr. Tennant, M.P.

It is extraordinary what apathy always exists in matters of fire-protection, as far as Parliament is concerned, for as we have already indicated it was practically only due to quite outside pressure that the fire clauses of the amended Building Act were obtained, and similarly it was mainly due to influence brought to bear from outside the actual House of Commons that the Select Committee here under review was really set up.

It is quite the exception to find an individual member of Parliament taking a personal interest in matters of fire-protection, the only

exceptions probably being Mr. Guy Pym on fire-brigade matters and Mr. Tennant on factory matters. Mr. Guy Pym was most successful in having a Select Committee appointed on fire-brigade matters, in which most valuable evidence was collected and most useful work done, but unfortunately up to the present no legislation has resulted. In time, no doubt, some such legislation will be obtained, but the matter has become very pressing. Meanwhile we trust that Mr. Tennant, who has had a Bill before the House of Commons since 1904 in respect to the amendment of the Factories and Workshops Act, will have success in obtaining more rapidly the legislation he advocates.

Mr. Tennant's Factory Bill.

Mr. Tennant's proposed Bill, of course, only deals with the factory aspect of the general question of escape from fire, but it is this that is of primary importance. It may thus be of interest to present the memorandum with which Mr. Tennant prefaces his Bill, and at the same time it may be of interest to note that in presenting the Bill he was supported, among others, by the well-known labour member, Mr. John Burns.

The memorandum with which Mr. Tennant's Bill was prefaced reads as follows:—

Mr. Tennant's Memorandum.

This Bill is limited to the amendment of those sections in the Factory and Workshop Act which deal with means of escape in the case of fire.

The Bill would amend the existing law in several respects. The limitation which confines the provision of means of escape from fire to factories and workshops where more than forty persons are employed would be removed.

It is also framed to make the following change in the existing law:—When a factory or workshop is contained in premises parts of which are utilized for such purposes as offices or warehouses, the local authority is unable to require the provision of means of escape from fire except with the consent of an objecting occupier of any part of the premises which is not used as a factory or workshop. The Bill amends the law by giving the same protection from fire to the worker whether the premises are wholly or only partly occupied as a factory or workshop. The Bill further provides for reference to the county court of any claim by the occupier of any part of the premises against the owner of the building on account of interference with the part occupied.

The other alterations in the law which the Bill would effect relate to the production of plans and drawings, the location of lifts and shafts and the prohibition of unsafe premises.

SPECIAL GLAZING AS A TEMPORARY FIRE-RETARDANT.

DURING the last few years the importance of protecting vertical openings in buildings against the spread of fire has begun to be appreciated by professional men, more particularly in the United States of America, and for this reason various forms of fire-protective glazing have been put on the market, of which wired glass and electro-glazing are the best known. Various firms resident both in the United States, the United Kingdom and the Continent of Europe purvey these different forms of glazing, and it has long been the ambition of various firms interested to prove to the satisfaction of the building world and to insurance corporations that their materials command attention as safeguards.

As to the importance of the protection of openings, a recent report by the National Fire Protection Association of America, dealing with the question of both door and window openings accords considerable space to this question, and we quote in this report the American view of what should be considered fire-retardant in the protection of door and window openings.

The American View as to Protecting Openings.

American opinion considers that regarding the covering to such openings—

(1) They should be made of non-flammable material.

(2) They should be good non-conductors of heat.

(3) In addition to their fire-retardant qualities they should be able to resist the shock and force of fire streams.

(4) They should be so constructed and mounted as to effectively cover the opening protected.

(5) Their ultimate fire-resisting point should be nearly, if not quite, equal to the fusing point of the materials of which they are made.

(6) They should be capable of withstanding the expansion due to heat and contraction due to rapid cooling.

(7) They should be capable of resisting all reasonable blows from falling members.

(8) They should be easy to operate, capable of being made automatic, acceptable in appearance, and should not be prohibitive in price.

The American requirements are more in the direction of providing shutters, blinds and doors to openings, but such coverings can obviously in many instances be supplanted by or supplemented by improved glazing.

Special Glazing.

As far as the glazing of window openings is concerned, the great difficulty has been for the various makers to prove that the protection afforded is not merely momentary, but of some considerable duration, and that given moderate temperatures, *i.e.*, temperatures not exceeding the melting point of glass, such glazing will afford protection quite equal to that afforded by, say, an ordinary 2in. hardwood door intended to withstand fire under similar conditions. It has been difficult to prove this, and it has only been possible to do it step by step, and even now it has only been possible to prove it within certain limitations on the question of size. But a vast improvement has been made of late, and those who have followed the investigations conducted by the British Fire Prevention Committee with electro-glazing and wired glass, dating back from 1899, will see what an advance has been made, until classification of affording "temporary protection" has at last been gained both by electro-glazing and wired glass as manufactured in this country.

In the earlier fire tests of the Committee it has been attempted to show that casements and skylights will withstand fire of moderate temperatures for twenty or thirty minutes, but this year it has been proved that given a limitation of size of 2ft. by 2ft., or (say) 4ft. super., it is quite possible to obtain that resistance which is required of ordinary hardwood doors, namely, that which is termed affording "temporary protection," *i.e.*, a test of forty-five minutes' duration to temperatures of at least 1,500 degs. Fahr., followed immediately by the application at short range of a stream of water from a steam fire-engine for two minutes.

In our supplement of March 15th last we dealt with the results of a test with electro-glazing. In this supplement we deal with two tests in respect of wired glass, of which the reports have been issued this month.

Mr. Max Clarke, F.R.I.B.A., in his prefatory note says:—

"In these days, when all sorts of appliances for the prevention of fire are advocated, it is of importance to consider at the same time the means to be adopted and the materials to be used to prevent the spread of fire. Many of these materials are expensive, and in some cases little is known of their behaviour under actual fire conditions. The comparatively moderate cost of wired glass has led to the present investigation in the hope that the knowledge gained thereby will be useful to all interested in the subject of fire-prevention."

The following are the official statements of the objects and summaries of tests with wired glass put forward by Messrs. Pilkington Brothers, Ltd., of St. Helens:—

THE VERTICAL LIGHTS.**Object of the Test.**

To record the effect of a fire of three-quarters of an hour duration. The temperature to reach 1,500 degs. Fahr. (815.5 degs. C.) but not to exceed 1,650 degs. Fahr. (898.8 degs. C.), followed by the application of water for two minutes, with the view of being classified as affording temporary protection (class A).

Note.—The squares of glass, five in number, were to be glazed—two into a teak frame, two into a steel frame, and one into brick reveals.

Each opening was approximately 2ft. 3ins. (0.685 m.) wide by 4ft. 6ins. (1.37 m.) high.

The openings are described as Nos. 1, 2 and 3:—

No. 1 being a teak frame, fixed in the north opening.

No. 2 being a steel frame, fixed in the centre opening.

No. 3 being a square of glass, in brick reveals.

Summary of Test.

Immediately on lighting the gas the glass in all the openings cracked, particularly round the edges. Beyond the cracks increasing, no perceptible change occurred.

The inside face of the teak framed architrave was considerably charred.

On the application of water there was an irregular patch of small holes made in the upper portion of the centre light, which was also bulged inwards; but otherwise the glass in all the openings remained in position. There were indications that the fire had passed between the frame and the glass of opening No. 1.

The fire did not pass through the glass.

THE HORIZONTAL LIGHTS.**Object of the Test.**

To record the effect of a fire of three-quarters of an hour duration on Pilkington's wired glass, $\frac{1}{4}$ in. thick (0.0063 m.), fixed horizontally as skylights. The temperatures to reach 1,500 degs. Fahr. (815.5 degs. C.), but not to exceed 1,650 degs. Fahr. (898.8 degs. C.), followed by the application of water for two minutes, with the view of being classed as affording temporary protection (class A).

Note.—The squares of wired glass, four in number, to be placed horizontally as skylights, two glazed in elm frames and two into steel frames resting in rebates of elm frames.

The squares in the elm frames to have a

SKYLIGHTS AFTER TEST (FROM ABOVE).

SKYLIGHTS AFTER TEST (FROM BELOW).

sight measurement of 2ft. by 2ft. (0'6095 m. by 0'6095 m.), described as Nos. 3 and 4.

The squares in the steel frames to have a sight measurement of 2ft. 1 $\frac{1}{2}$ ins. by 2ft. 1 $\frac{1}{2}$ ins. (0'6476 m. by 0'6476 m.), described as Nos. 1 and 2.

Summary of Test.

Immediately on lighting the gas the glass in each of the four frames cracked in various directions, with slight but sharp reports. Beyond this no perceptible change occurred in either of the squares of glass, except that between the twelfth and fifteenth minutes small thin flakes came off the upper surface of the glass in square No. 4 in some places.

The inside face of the elm frames was charred from $\frac{1}{2}$ in. (0'0127 m.) to $\frac{3}{4}$ in. (0'019 m.) in depth, and the fixing beads on the outside were twisted and displaced. The steel frames were not perceptibly affected.

On the application of water the glass in each of the frames developed hair cracks all over, but water did not pass through either of the squares of glass. A slight amount of smoke found its way round the elm frames, but fire did not pass through either the glazing or frames at any point.

Water was thrown on the top of the squares of glass but did not pass through. Each of these squares had sagged in the centre from an eighth to a quarter of an inch (0'0031 to 0'0063 m.).

A FIRE AT DURBAN, SOUTH AFRICA.

IT is so extremely difficult to obtain good photographs of fires that we reproduce below an illustration from a negative taken at Durban, South Africa, which shows very clearly a fire breaking through the roof of a building at a time when no flame or smoke has so far come through the window openings.

We take this opportunity to remind readers that we welcome photographs of important fires and ruins of fires, particularly if the effect of the fire on constructional work is shown.

Such photographs should be addressed to "the Editor."

FIRE CONGRESS AT MILAN.

WE understand that a fire service and fire-preventive congress is to be held at Milan in May, 1906, under the auspices of the International Fire Service Council,

and at the invitation of the Italian Fire Preventive and Fire Service Federation. This congress will be held on the occasion

of an exhibition that is taking place at Milan in respect to which the London Chamber of Commerce has formed a special committee.

It may be anticipated that as heretofore with such congresses a number of valuable papers and contributions from all countries will be presented for consideration and discussion, and it is to be hoped that on this occasion, seeing that the local language is one not well known to the majority of those interested in the subject, there will be a considerable staff of interpreters, and that all papers presented will be translated into at least two better-known languages, say French and English. This is a direction indeed in which an improvement might often be effected in international congresses. Translations should be available at the time papers are read and not published months afterwards.

The National Fire Brigades Union will hold their next Council meeting at Liverpool.

Mr. Max Clarke, F.R.I.B.A., has been accorded the Silver Insignia of the Imperial Fire Society of Russia by the Grand Duke Vladimir, acting for the Czar.

Colonials and Fire-Prevention.—It is of interest to announce that a New Zealand section of the British Fire-Prevention Committee has been formed with a nucleus of fourteen, and it is anticipated that a similar section will be constituted this winter in Canada.

A CASEMENT IN METAL FRAME AFTER THE TEST (FROM THE FIRE SIDE).

A FIRE AT DURBAN, SOUTH AFRICA.
(Showing flames and smoke breaking through a roof.)

A NEW YORK FIRE.

View on Fifth Floor.

View on Seventh Floor.

THE EMPIRE STATE BUILDING FIRE NEW YORK.

THE three illustrations which we publish herewith are from photographs specially taken for the "Fireproof Magazine" showing parts of the sixth, seventh and eighth storeys of the Empire State building, 640, Broadway, situated at the south-east corner of Bleecker Street, New York, which was partially damaged by fire on March 22nd last. As will be seen in the views on the seventh and eighth storeys, the floors of this building were of fire-resisting construction, and that is the reason why the building was saved almost entirely, even though all the water thrown on it had to be raised to a great height by the fire-engines alone because the stand-pipes and hose in the building proved to be useless.

The building measures 25ft. by 125ft., and has nine storeys, above the street level. It was erected eight years ago. The outside walls are lined with hollow brick and the floors are all supported by deep steel I-beams. The floors are filled in between the I-beams with long-span segmental arches of porous terra-cotta blocks. The arches were also plastered on the underside of the seventh and eighth-storey ceilings. The ceiling of the sixth storey appears to have been furred off and plastered to a straight line.

The fire started on the seventh storey among millinery goods. The three upper storeys were occupied for wholesale millinery business, which, it is well known, is very combustible, and the accounts show that the fire spread through the three upper storeys with great rapidity, totally destroying the contents.

The fire did not extend below the seventh storey, the damage in the sixth and lower storeys being only from water.

But the pictures convey lessons of faults in building in no way attributable to the construction. The hallways around the stairs and the elevators were partitioned off with substantial partitions, which were all left standing where they were not supported by wood. But here we see the unnecessary amount of wood used in their construction. The glass in the partitions, of course, disappeared and much of the woodwork. The fire communicated to the eighth and ninth storeys through the stairways and elevators, and also through the outside window. It will be seen that outside window-frames in the seventh storey have entirely disappeared. The damage to the building was mainly in the combustible material.

The site of this building has a remarkable fire history. Nine years ago it was occupied by the Empire State Bank, a building of ordinary construction. It was then totally destroyed by fire, and the fire communicated across Bleecker Street to a large new building on the north-east corner of Broadway and Bleecker Street through its large exposed windows. This building was almost a total wreck, and it was announced by the press to be a "fireproof" building which had failed. When the nature of its construction began to be known it was found that while incombustible materials had been used in its construction it violated every well-known principle of fire-resisting construction. The floors were supported by long steel girders from wall to wall, which were entirely unprotected by any fire-resisting material, and the ceilings were all of wooden lath and plaster, which provided additional fuel to destroy the girders which collapsed wherever the fire was severe. An officer of the fire department was killed by falling through a marble platform in the iron stairs, and many other foolish constructions were discovered. It demonstrated that the additional cost of all the iron and steel in the building had been a waste of money, because it had not been protected from fire.

PREVENTION OF FIRE LOSS IN THE UNITED STATES.

LONDON has recently had the pleasure of a visit from that noted expert on economics, and questions of fire loss in particular, Dr. Edward Atkinson, the President of the Boston Manufacturers' Mutual Fire Insurance Co., and at the same time President of the Boston Insurance Experimenting Station. Mr. Atkinson, who at the age of eighty still shows the youth and energy of a man of half his years, has probably done more for the prevention of fire loss in the United States than any other man in that country, and he has had the great advantage of being able to carry out his programme on essentially commercial and economic lines, inasmuch as his teachings were always embodied by the practice of the Mutual Insurance Corporations, which he developed and controlled. These Mutual Corporations, whose work it is to organize the Mutual Self-Insurance of Manufacturers having similar fire-hazard to contend with, have done an immense amount of good in the United States, not only as far as fire loss proper is concerned, but also in many questions relating to the general economics of the industries with which they are in touch, for they are managed on broader lines than insurance offices generally, their scope extending to advising their clients as to anything in the way of order or economy which may increase their efficiency and at the same time reduce the fire-hazard.

The Attitude of the Fire Insurance Companies.

It is very rare indeed that fires of importance occur on property insured on the mutual principle. This is mainly due to the remarkable system of inspection, survey, control and watching practised in regard to properties thus insured. Although ordinary insurance companies, known in America as stock companies, would be loth to confess it, we may also take it that the new movement now to be found among all the leading fire offices of the United States to encourage fire-prevention and to go about their work more scientifically than heretofore, has been mainly due to the example set and the results obtained by the mutual system which Mr. Atkinson organized. There can be no doubt that at the present moment the managers of the insurance companies of the United States, and the resident representatives of the British insurance companies trading in the United States, are doing more for fire-prevention than any other insurance officers anywhere in the world.

In fact, the expensive lessons, due mainly to the short-sighted policy that used to prevail, have now made it necessary in the States to give up that extraordinary idea that the science of fire-prevention could be excluded from an insurance company's programme of work.

We publish below some interesting notes by Dr. Atkinson upon the position of the fire loss question in the United States, which will be found to have a considerable bearing upon the problems of fire-resisting construction and design, while at the same time they suggest directions in which fire-insurance offices and legislative authorities can materially advance the welfare of the community.

Some Views by Edward Atkinson, LL.D.: Climatic.

"The problem presented to the underwriters of the United States and to the community as a whole is totally different from any problem that could be found in any European country, especially in Great Britain. First, the climate or climates of the United States vary from those of Europe in matters that have an important bearing upon the construction of buildings. I will omit the conditions of the extreme South and of the extreme North, dealing with the great section which extends from the Atlantic to the Pacific, between parallels of latitude

35 degs. to 45 degs. N. In this section will be found the larger part of the population, the greater number of factories and workshops, the principal cities and public buildings, and by far the greater number of the public school buildings in which the sessions of the common free schools are held. Within this section there are very great variations between summer and winter, the common range of the thermometer being from 30 below zero Fahr. — (34 degs. C.)—sometimes lower—to 90 Fahr. + (32 degs. C.), and sometimes higher. There is also a great variation in the constant of humidity. On the whole, the entire section may be considered dry as compared to the average of Great Britain until we reach the extreme western coast, where the climate of Oregon and Washington more nearly resemble the humid climate of Great Britain."

Materials.

"The next variation from European conditions is to be found in the huge abundance

the atmosphere within the dwelling or building, making the house very damp and difficult to heat; whereas in the hot summer brick walls heat very rapidly and become intolerable unless expensively constructed with air-spaces. On the other hand, wood is well known to be among the best of the non-heat-conducting mediums, and when disposed in thick sections of heavy mass the building of wood or timber, with properly-constructed roof, is warmer in winter, cooler in summer, more easily heated and ventilated and in every way a more sanitary building than any other kind yet devised except at very heavy relative cost."

Log Construction.

"The typical dwelling of the early settlers was therefore the log cabin, the most comfortable and suitable dwelling that could have been devised or constructed at any moderate cost within the means of the early settlers. The next typical dwelling-house, built by the richer citizens when the various colonies

THE EMPIRE STATE BUILDING FIRE, NEW YORK: VIEW ON SIXTH FLOOR.

of timber, both resinous and hardwood, and the relative scarcity of good building stone in the earlier period of the history of the country. As yet no building stone has been discovered corresponding to the stone which is so much used in France and Belgium, which can be cut and carved like cheese, but hardens like iron on exposure to the atmosphere for a short period. It therefore happened that the best material for the construction of dwelling-houses in the earlier stages of the growth of towns and cities and throughout the country districts is wood, disposed in a suitable manner and properly finished within and without, rather than brick or stone. It is also true that when these latter materials are used in the ordinary way, that is, without excess of cost in building thick walls with air-spaces in the walls to prevent ill effects of cold, heat and dampness, they are alternately affected by heat, cold and dampness in excess, from which properly-constructed wooden buildings are free. In the extreme cold of winter brick and stone walls become chilled, presently gathering humidity from

began to prosper, was constructed in what is now known as the colonial style by well-trained mechanics who brought their conceptions from England. In the early period these dwellings were constructed of oak timbers, heavily framed, covered in with very thick boards, nailed on with wrought-iron nails; often filled in between the wood and the inner plastering with brick and then finished in a very solid manner—often, in principal rooms, with panels of the old English style. These broad, well-proportioned colonial houses left nothing to be desired in comfort, convenience and safety at the standard of that period and under those conditions. Many still exist, some of them over 200 years old."

"The solid method of construction, both of town and country buildings, however, gave place to a very dangerous type of building from the underwriter's point of view, when the circular saw was applied to cutting up the solid timbers into plank, joist and scantling of various kinds, which have been put together in what has sometimes been called

basket framing, leading to the construction of buildings of a cellular type; the light frames being put together in such a way as to be very firm and strong by bracing and boarding on the outside, or covered in by brick walls in cities; the plastering within on wooden lath and placed on the face of the inside of the frame; partitions constructed in the same way and floors of the same kind; so that the result is a building pervaded with cells of wood very difficult to cut off from each other, communicating with a hollow-ceiled roof of the same type of construction; hence the largest possible loss by fire is assured from the least possible cause."

Slow-combustion Construction.

"The change which has been brought about in factory construction under the influence of the Factory Mutual Underwriters has not been in giving up the use of wood or in any effort to construct fireproof mills or workshops; but in reverting, one may say, to the heavy timber construction of the colonial period and the disposal of plank and timber within brick or stone walls in such a way that there may be no concealed spaces through which fire may pass out of reach of water. In that way, and by evolving suitable safeguards and means of protection, the whole system of constructing the textile factories, paper mills and workshops has been rendered safe and suitable. The losses by fire within the risks which are under the supervision of the Factory Mutual Underwriters have been, in the older companies, for fifty years less than 15 cents per year on each hundred dollars ('0015 per centum) of insured property; and during a period of more than seven years the losses within these risks have been less than 4 cents per year on each hundred dollars ('0004 per centum) of insured property, or about one-fifteenth part of the loss on insured property outside their range. Their influence is now pervading sections of the country which it has only lately reached, and a profound change is coming over what may be called industrial architecture, since the prevention of loss by fire in factories and workshops of slow-burning construction has been made an applied science, of which the rules and practices are easily mastered.

"Having drawn attention to the different conditions which govern architecture and building in the United States as compared with European States, we may now take up other conditions. It would have been a misfortune had the people of this country adopted more durable methods by constructing city buildings, factories and workshops, of a more permanent kind than they did construct. Such buildings would have been erected at a much heavier cost, they would have become an encumbrance upon the land, and yet of such solid construction that they might have been incapable of being converted to the right use of modern mechanism. It is only about thirty years ago that a most skilful and competent mill engineer, under whose supervision some of the largest textile factories had been constructed, made the remark that it was not judicious to plan any factory building for a duration of more than twenty-five years, except as to the foundations. Had he made that remark a few years later he would not have excepted the foundations. The textile factory and many other industrial buildings constructed fifty years ago were not over 50ft., often less, in width, and some of them were eight or nine storeys high. The next type was a factory or workshop 60ft. in width and five to six storeys high. Neither type of building is fit for modern conditions, and no person could run modern machinery with any profit whatever in the old type of narrow and high factory building. The modern textile factory is seldom more than three storeys in height for carding and spinning;

one storey for weaving. Wherever there is room, machine shops are built of one storey, and many other industrial buildings are now being constructed in a similar way. The diffusion of light by ribbed or prismatic glass assures an even daylight over very wide areas, with freedom from glare near the windows.

"These rules and methods of slow-burning or mill construction and for the diffusion of light are now being established throughout the United States beyond the area of the influence of the Factory Mutual Fire Insurance Companies, by the distribution of documents from the Insurance Engineering Experiment Station, now beginning its work.

Modern Construction.

"We may now take up the growth and construction of towns and cities. In that, again, a rapid construction of wooden buildings for temporary use has been and still is necessary for the housing of the population. Throughout the middle and the far-west, where public lands have been disposed of in quarter sections of 160 acres each, towns have been planned on rather a grand scale with a view to future growth into cities. In very many cases that growth has been attained within a very short number of years. The first buildings, hastily constructed of wood, soon give place to a better class, and if the town grows a wider area may be covered with wooden buildings detached from but very close to each other, the only conspicuous building of a durable kind being the public common school-house, for the construction of which reservations have been made from the public land. Presently the detached wooden buildings give place to brick blocks of a more permanent character, and yet not suitable for any very long duration. In the older cities of the East narrow streets may be bordered by alternating very old wooden buildings and modern structures, safe or unsafe as the case may be.

"Hence comes the necessity for very completely organized and efficient fire departments, and yet occasional conflagrations occur; witness the great fires in Chicago and Boston. These conflagrations were not unmitigated evils. They were disastrous to individuals and to part of the insurance companies, but they cleared away a great ruck of unsafe and unsuitable buildings, made the way for readjusting lines of streets, and both in the end worked improvement in the cities at the cost of the individuals who suffered. The Boston fire, however, did not discriminate wisely. It approached quite a large section of old and dilapidated buildings, occupying land leased nearly 100 years ago upon a ground rent—this lease so near its termination that it is not for the interest of the owners to remove these old buildings, but to get all they can out of them, so that they remain a blot and menace in the centre of the vast business district. Had the Boston fire exerted sufficient discrimination to cross a street and to wipe out that section on the leased land, it would have been a yet greater benefit to the city of Boston. These long ground rents are very uncommon. They are now prohibited in many States, and where they exist are obstructive to the public welfare.

"It thus happens that what may be called unsafe methods of construction have been both necessary and expedient in the progress of the development of the country, and that more permanent buildings which would have absorbed a much greater part of the small capital available would have been an encumbrance rather than a benefit.

"Such being the quality and the conditions of the general average of industrial buildings, shops, warehouses, &c., constituting 95 per cent. of the insurable value of property in the United States outside the lines of the Factory Mutual Companies, what are the

conditions to which the prevention of loss by fire can be applied? They are either the incapacity of architects and builders to apply conditions of safety to the construction of ordinary buildings, or the yet greater incapacity and unwillingness of owners to change from the bad methods even at the instance of an intelligent architect. Faults are committed and re-committed by owners which might be remedied without increase of cost, and very often at less cost, if it had not become the habit of owners and occupants to consider their duty ended when they had negotiated a policy of insurance covering whatever risk (often avoidable at a lessened cost), they might chance to commit. The next element of danger is the gross and criminal carelessness of the occupants of such insured premises.

Fire Loss.

"The ash heap of the United States averages 150,000,000 dollars (£30,000,000 sterling) a year, two-thirds of which is due in about even proportions to the inattention, incapacity or negligence of owners, occupants, builders and architects alike. Or, to put the case in another way, the ash heap, averaging 150,000,000 dollars a year, might easily be reduced by one-half; excess of premiums and heavy cost of insurance, amounting to at least 80,000,000 dollars (£16,000,000 sterling) a year; the excess of water-supply and cost of fire departments, which may be estimated at 20,000,000 to 50,000,000 dollars (£4,000,000 to £10,000,000 sterling) more, makes the aggregate remediable excess of cost of fires in the United States at least 200,000,000 dollars (£40,000,000 sterling) a year, all of which might be saved. This may be attributed mainly to the restless energy and severe work given to attaining the main point of large production from resources as yet only beginning to be worked upon, and their distribution, to the neglect of the lesser elements and close economy in the small details, and to the total lack of any conception on the part of the owners and occupants of buildings that they themselves are the only persons who can prevent loss by fire by attention to construction and suitable safeguards; fire departments being only capable of dealing with the fires when they occur, and underwriters being only capable of showing the way and giving advice by which the heaviest losses may be saved.

Safeguards.

"The safeguards which are now being introduced, notably the automatic sprinkling system, might, in the judgment of the writer, abate more than one-half of this annual loss. The larger part of the losses is in the large workshops, factories, warehouses and shops for the distribution of goods. They occur in a relatively small number of fires, each of large proportion. They occur, in by far the large majority of cases, in buildings which, although not good models, are capable of being well protected by automatic sprinklers, by standpipes and hydrants at vantage points and upon the roofs, so adjusted as to be worked by the public fire department, and by care in occupancy.

Insurance Aspects.

"We now come to the position of underwriters other than the Factory Mutual Underwriters in this matter. Twenty years ago, or thereabouts, it was thought to be the function of the stock underwriter or manager of a stock insurance company to take risks as they might happen to be at a rate which it was assumed would cover the risk, leaving a margin of profit. This system worked very well down to the date of the Chicago fire, but under it no provision had been made by a large part of the insurance companies for the hazard of an extensive conflagration; hence the bankruptcy of very many insurance companies. An advance in rates was made, but as yet no system of inspection was

established before the Boston fire, and that, again, rendered bankrupt nearly every insurance company in Boston and many others. Shortly after, the underwriters, having found out that betting on bad risks even at high rates was an unprofitable business, began in Boston a system of inspections, putting conditions upon risks, re-rating, and establishing premiums according to compliance with conditions.

"This system has been extended throughout the country, elevating the profession of the underwriter and tending to the greater security of the community, and promising hereafter greater immunity from large losses. In fact, a large reduction in the proportion of loss to property insured has been made in recent years. The losses are or may be larger in the aggregate, but the property calling for contracts of indemnity against loss by fire (now 25,000,000,000 dollars = £5,000,000,000 sterling insured) has increased by such leaps and bounds as to make the proportion of loss to the aggregate hazard somewhat less than it was a few years since.

"In this way the lines of future improvement are well marked. The different unions and combinations of the stock underwriters have established testing laboratories, notably in Chicago, where they are dealing with very many problems that do not arise with the Factory Mutual Underwriters, and with some of those on which they are working in harmony with us. On the other hand, the right methods of building factories and workshops of timber, stone and brick have been fully established, and the methods of protecting by safeguards have been brought to a final condition in the present state of the art.

The Steel-framed Building.

The invention of the self-sustaining steel frame building, developed in the construction of what are known as skyscrapers, has brought an entirely new problem before the underwriters as well as the engineers. In the first instance it was assumed that because a building was made of incombustible material it might be considered indestructible by fire, with very slight protection to the metal from heat. The Factory Mutual Underwriters distrusted this theory and have, with rare exceptions, kept unprotected steel beams from being used to support plank floors, and have in recent years caused cast-iron posts, formerly used in the support of factories, to be disused, the preference being given to squared wooden posts.

"With the increasing cost of timber and

possible scarcity of large logs it became expedient for the representatives of the Mutual Underwriters to be prepared for so-called fireproof construction. To that end the Insurance Engineering Experiment Station has been established under the charge of Prof. Charles L. Norton for testing both by fire, by laboratory experiments and by lapse of time all the different methods of so-called fireproof construction and all the fire-resistant and fire-retardant materials for inside finish.

"The experience of the underwriters who insure the steel-framed buildings has not justified the great confidence with which the work was undertaken. Very destructive fires have occurred in buildings of this type, which have been filled with combustible contents. In some cases it has been the judgment of the appraisers that the total loss on contents of very large value has been due to the resistance of the building; whereas in buildings of ordinary construction which fell after a fire of moderate duration there have been large salvages on damaged goods.

"Several of the methods of protecting steel from heat have failed, and while the building has stood well and has, I believe, in all instances been capable of repair, there has been much damage by heat, especially in the upper storeys. It has proved that the prevention of loss by automatic sprinklers is as necessary in an incombustible building as it is in any other. A large portion of the biggest department stores is now being equipped. Other fires in incombustible buildings, causing very little damage, have generated so much suffocating smoke as to make them hazardous and to lead towards the danger of a panic."

THE NEW TESTING STATION.

WE publish on this page a plan of the new testing station which was completed this summer, with a view of showing the arrangement of the testing chambers and particularly the two new styles of chambers demonstrated in huts Nos. 1 and 3.

In hut No. 1 we find the composite chamber of which part can be utilized for door tests and part for tests with different forms of glazing.

Hut No. 3, on the other hand, shows the special large size hut for floors measuring 15 ft. by 22 ft., which is a size very common for rooms in office and warehouse buildings,

and allows large spans to be tested. As to the character of the testing chambers, they are too well known to require additional description beyond that the stock brickwork that had always been used in the testing chambers has certainly been found to be one of the most suitable materials for fire-resistance, the stock bricks at times actually clinking owing to the heat applied to the objects under investigation, but always remaining sound and in the extreme showing some cracks at the most exposed point.

Tests in Preparation.

The tests in preparation include the much-discussed test with floor sections showing seven different aggregates of concrete, the special object of the test being to show the relative reliability of these various aggregates under test, of fire, followed by the immediate application of water. The test is to take place in hut No. 2, and there will be seven bays measuring 3 ft. 3 ins. centre to centre, each 10 ft. long and each slab of concrete being 3 ins. thick.

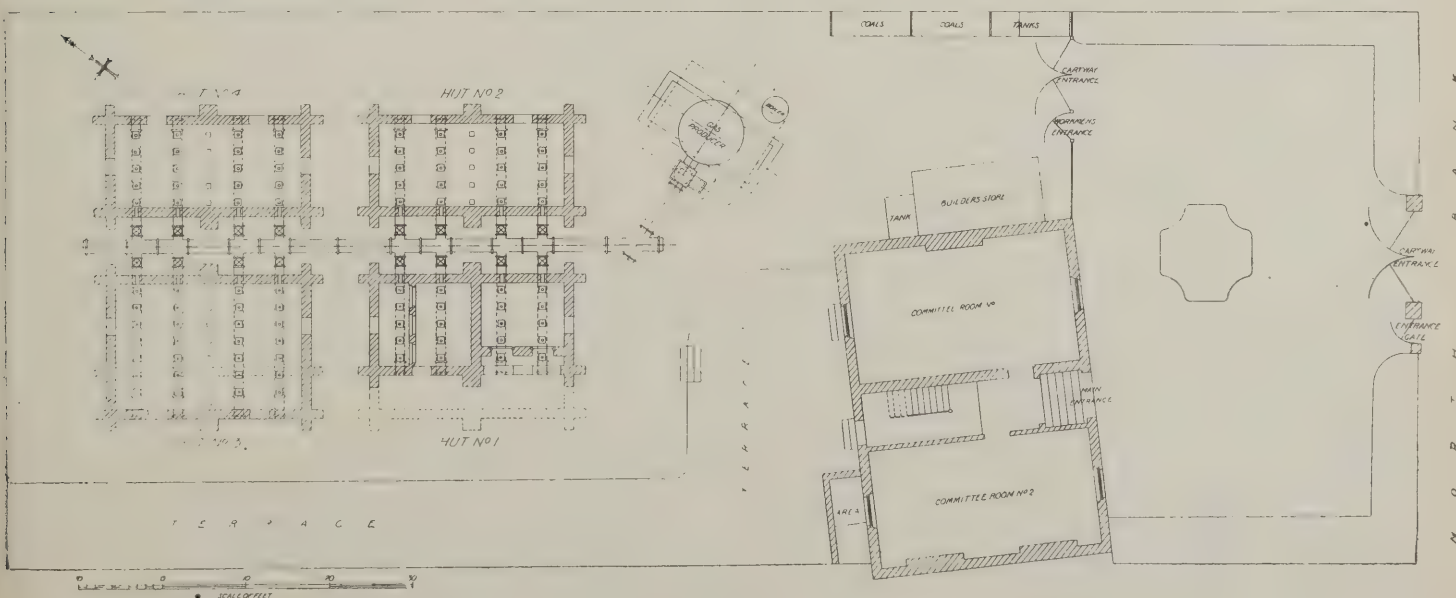

The seven aggregates are (1) blast furnace slag concrete, (2) broken brick concrete, (3) broken granite concrete, (4) burnt-ballast concrete, (5) coke-breeze concrete, (6) furnace clinker concrete, and (7) Thames ballast concrete.

For the concrete the Associated Portland Cement Manufacturers, Ltd., have provided their "Ferrocrete" standard cement and also a sand from their Gravesend yard. The other materials have been obtained from Messrs. Broad & Co., the builders' factors, and a pedigree of each of the different materials has been obtained, which is of particular importance in such a case as the furnace slag and the furnace clinker. The concrete was put into position during the week ending September 16th, and we understand that the time allowed for setting and drying is twenty-eight days.

Parallel with this experimental investigation on behalf of the British Fire Prevention Committee, Messrs. Coignet are in occupation of hut No. 3, where they are erecting a floor on their reinforced-concrete system in which they are utilizing clinker-concrete.

Besides this, as previously announced two, tests are in preparation in respect to Messrs. Cullum's pumice ceiling slabs and Mr. Jabez Thompson's stanchion coverings.

It is expected that the two testing days on which this series of four tests is to be conducted will be in the middle of October.

THE NEW OFFICIAL TESTING STATION.

Showing the large testing chamber for floor tests (No. 3) and the composite chambers for door and window tests (No. 1).

VIEWS OF THE BREMEN DOCK FIRE.

In the previous supplement further views showing the collapse of all unprotected steelwork at this fire were published.

CHICAGO'S NEW BUILDING BY-LAWS.

Extracts from the new Building Ordinance adopted by the City of Chicago this year.

IN continuation of the extracts presented on pages 20, 21, and 22 of the previous Fire Supplement we herewith present the clauses relating to "cinder-concrete," which should be a useful guide to those who specify "coke-breeze concrete," "clinker-concrete" and "furnace slag concrete":—

Approved Cinder-concrete Construction.

968. (Concrete Construction.—Approved Cinder.)—The term "approved cinder-concrete construction" shall apply to all buildings in which all parts that carry weights or resist strains, all exterior walls, all interior walls, all interior partitions, all stairs and all elevator enclosures are made entirely of incombustible material, and in which all metallic structural members are protected against the effects of fire by approved cinder-concrete proportioned, mixed, applied and secured as herein described. Approved cinder-concrete construction may be used for all buildings in which fireproof construction is mandatory by this ordinance, or where ordinary construction may be used.

969. (Concrete — Cinder — Approved). — Approved cinder-concrete shall consist of a standard Portland-cement, torpedo sand, and clean, thoroughly burnt, steam-boiler cinders, free from deleterious matter, no particle of which shall be larger than 1 in.

970. (Cinders—Quality).—The volumetric quantity of the cinders combined with the torpedo sand shall not exceed the volume of the Portland cement by eight times. All of the ingredients of approved cinder-concrete shall be thoroughly worked and wet so as to cover each piece of cinder with moistened cement; and the cement and sand shall fill all of the voids between the cinders.

All approved cinder-concrete shall be cast and rammed in an unset condition against the metal.

The minimum thickness of approved cinder-concrete covering in structural metal shall be 2 ins. In every case the thickness of the coverings shall be measured from the extreme projection of the structural metal unless otherwise provided in this ordinance.

971. (Columns Approved—Concrete Coverings).—The approved cinder-concrete covering of the columns shall be not less than 3 ins. in thickness from the extreme projection of the metal, including the plastering, and in all cases the cinder-concrete shall be rammed solid against the column metal, filling all channels and open spaces

within the perimeter of the finished plaster column. Approved cinder-concrete column covering shall have metal binders of No. 8 gauge wire embedded in and around the columns for each 16 ins. in height of the column, provided, however, that in buildings of approved cinder-concrete construction the columns may be covered with one thickness of metal, furring metal, lathing, and not less than three coats of mortar.

In places where there is trucking or wheeling, or handling of packages of any kind, the lower 5 ft. of each and every column shall be encased in a protective covering such as is described in section 923 of this ordinance.

972. (Beams and Girders—Approved Concrete Construction).—The beams and girders of a building built of approved cinder-concrete construction shall be enclosed in approved cinder-concrete which shall be not less than 2 ins. in thickness at any and all points of the structural metalwork. The approved cinder-concrete covering shall be reinforced with metal clips or wire binders, either or both of which shall not be more than 16 ins. on centres in the direction of the length of the structural member.

The top of all girders or beams shall be protected with not less than 2 ins. of approved cinder-concrete.

A roof or floor construction of cinder-concrete may be used for any span between structural members that will carry the test loads required by city ordinance for such floors and roofs.

973. (Segmental Arches).—Segmental arches shall be not less than 3 ins. in thickness at the crown.

974. (Floors—Flat Slab Construction).—Flat slab construction shall be not less than 4 ins. in thickness for spans of 8 ft. or less. Flat slab construction shall be not less than 5 ins. in thickness for spans between 8 ft. and 10 ft.

Approved cinder-concrete shall not be used as a floor or roof construction unless such approved cinder-concrete is reinforced by steel or iron, and such reinforcement shall not weigh less than 1 lb. per sq. ft. of superficial surface.

All reinforcing steel shall be completely enclosed by the concrete.

Wood nailing strips for floor surfacing may be used in buildings of approved concrete construction, provided, however, that such nailing strips shall be embedded as described in section 934 of this ordinance.

975. (Partitions).—The partitions in buildings of approved cinder-concrete construction shall be as described in section 935 of this ordinance for partitions in fireproof buildings, provided, however, that partitions may be built wholly of metal studding, metal lath and plaster, but no such partitions shall be of a lesser thickness than 1 in.

The partitions around stairs, or stair halls, or shafts, or elevators, or public lavatories, shall be wedged tight between the structure of the floors and ceilings, or if such partitions are of plaster the metal or metal studding shall be secured to the structure by clips, bolts or other metal fastening, and in no case shall any such partition be built on the wood flooring or wood nailing strips.

976. (Walls—Enclosing).—The enclosing walls, the covering of exterior side of mullions, beams, girders, lintels, the enclosure of pipes, pipe shafts, the doors into shafts, windows into shafts, covering of girders, covering of trusses, cut-out boxes, chasses, stairs, landings, painting, rivets, bolts, inspection of truss designs, inspection of trusses, precaution against wind-pressure, and all other items required in the sections on fireproof construction and in the sections on skeleton construction, shall, in buildings of approved cinder-concrete construction, be designed or built or covered or made of the material called for or any one of a number of these requirements, as described in such sections describing the requirements of skeleton construction or of fireproof construction in this ordinance, provided, however, that approved cinder-concrete as described herein may be used for all protective covering of structural metal.

THE AALESUND FIRE.

THOUGH of no great technical importance from a fire point of view, it would be well, at a time when Norway is so much before the public, to prevent this fire from dropping into that oblivion which so often occurs in respect to conflagrations nearer home. The Aalesund fire was remarkable as under the class of what we would term village fires. An enormous number of minor buildings were destroyed with great rapidity during the cold climatic conditions, and a large number of inhabitants rendered homeless and destitute. The occurrence was one that could easily happen in some of our northern villages and townships.

Aalesund has about 14,000 inhabitants; it is situated on the Mold Fiord, among the islands of the Norwegian coast. Most of the buildings were mainly of wood construction. The fire area is shown shaded on the plan.

One very remarkable feature of this fire was the splendid aid rendered at the instance of the German Emperor by the Hamburg-American Steamship Co., which organized a relieving expedition with marvellous celerity, and of the highest possible efficiency.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

October 4, 1905. Vol. 22, No. 556.

6, Great New Street, Fetter Lane, E.C.

Summary.

Writing about the sculpture on the new War Office in Whitehall, Mr. M. H. Spielmann says that Mr. Drury has gone, probably, far beyond what was expected of him "by revealing a power of thought and invention, and a capacity for handling a big conception realized on a big scale, of which his previous charming work had given promise rather than proof. He has thus justified himself and the selection of the authorities in the vast personifications of Peace and War which, seated in Michael Angelesque juxtaposition, decorate the angles and side faces of the building." (Page 193.)

In a paper which he read before the recent Johannesburg meeting of the British Association Mr. Reginald G. Kirkby, A.R.I.B.A., said that until some additional means were provided to enable the young South African architect to obtain a proper theoretical training they could only hope to turn out rule-of-thumb men. There were practically no existing facilities for students to obtain the necessary training, although the R.I.B.A. had consented to hold examinations in South Africa. (Page 201.)

The consideration of least importance upon the exterior of a building is the decoration of its broad surfaces, which in most cases are best left plain. If, however, for purposes of scale, tone or colour these surfaces are to be decorated, they become an all-over pattern, either a diaper or of parallel bands or forms suggested by the material of which the surface consists. (Page 190.)

The late Mr. Alfred Waterhouse bequeathed legacies varying from £100 to £1,000 to present and former pupils "in grateful recognition of their efficient and willing services." (Page 198.)

A great boulevard, costing £3,000,000, is to be made across Madrid. (Page 201.)

In St. Petersburg private dwellings must not be more than 77ft. high. (Page 192.)

The stonework of the great east window of Tintern Abbey has been taken down and reset, as it had become in a more or less dangerous condition. Some pieces of the main tracery which had fallen were found, and it was thus possible to complete the large ring in the head of the window as formerly existing. (Page 195.)

Our ancestors had only a few materials, which they thoroughly understood and used in the most direct and unflinching manner. If they did not know the chemical and physical properties of these materials as well as we do, they had a practical insight into their working, which is of far more importance in design than the most profound analysis. (Page 200.)

The Estimating Clerk.

At the present season, when contractors are experiencing difficulty in obtaining sufficient work to carry them through the winter—which is always the slack period in the building trade—and at a time which it is hoped will be the last of several years of bad trade, it is opportune to enquire into the current practice of estimating for contracts. Estimates are prepared by estimating clerks who work to a standard which is the result of a policy adopted generally for many years by contractors. Most contractors seem to imagine that what others can do they themselves can do, and their estimating clerks are instructed either to get "the job" or do the best they can to secure contracts. If the estimator secures a contract by undercutting the next lowest tender by only a few pounds, he is appraised highly for the moment, until the job is found to be turning out badly, without the profit expected, or at a loss. The estimator seeks a ready excuse in disclaiming responsibility, ascribing the fault to the foremen or to the inability of the contractor to purchase his materials at the lowest price or in the cheapest market; and of course as he is allowed little or no control over the management of a job it is only natural that he should be relieved of much of the responsibility for the difference between the estimated and actual cost. This continual undercutting by estimating clerks in many contracting firms has resulted in a regular system whereby in the majority of cases work is obtained at a figure which is often unprofitable and sometimes ruinous to the contractor. Then, again, contractors with large staffs always find it necessary to have a certain quantity of work on hand, even if the profits are reduced to the vanishing point, because it would be more disastrous to keep the staffs unemployed. Of course those engaged in the building trade despair of any alteration in the system, and therefore they try to make their profits by the substitution of inferior work, or upon the extras and from fortunate circumstances. We suggest that the remedy may be sought in the following directions. Builders should come to the conclusion that to continue in the present system is simply suicidal. They should decide that their estimating clerks

shall put in a fair price which will leave an adequate profit, and, if they lose the job, not subject their clerks to censure. Moreover, the estimating clerk should be given a more prominent place in the business. He should be chosen for his general knowledge and constructive ability, and should be given the supervision of the job for which he has successfully estimated, with power to see that no hitches occur and that there is no waste of labour; and finally he should be allowed to suggest improved methods of executing the work so as to effect economy. In fact, the estimating clerk should approximate more to the position of manager in English businesses and of the superintendent and head of the engineering department in American contracting firms. He should be a trained contractor's engineer with inventive capacity.

ONE or two cases have been brought to our notice recently of competitions in which there has been some suspicion as to the fairness of the assessor's award. This must necessarily be a very difficult matter to prove, but in well-informed circles a great deal is often known which does not get into public notice. The present is no occasion to talk about the integrity of the assessor, because he comes under the ten commandments just as much as anyone else, but we regret to have to call attention to the fact that his judgment may sometimes lean unduly towards the efforts of those who may be his friends or who may have some business connection with him, with the result that, in judging the designs submitted in a competition, some by total outsiders may be passed over more because they are by outsiders rather than because want of merit warrants their rejection. There is, perhaps, hardly a subject connected with architecture which gives rise to so much jealousy and dissatisfaction as competitions, and it is in the nature of things that the assessor's award should often be the subject of unfair criticism and quite ill-founded statements. At the same time it is not always the competitor who is wrong, and when it becomes a matter of suspicion of playing into the hands of interested parties it is time to protest. We leave it at that, to those concerned.

THE PLANNING OF DECORATION.

ARCHITECTURE is primarily proportioned construction, so that the first duty of the ornament which is associated with it is that the expression of the construction should not be denied or violated; and as construction is made up of a number of parts, the ornament naturally accents those parts and their combinations. A building has mass, stability and focus. Its mass is expressed by its surface, its stability by its perpendicular and horizontal lines, its focus either by its axis, its largest unit, or both. As it is made up of a number of integral parts or cells, the parts must correlate and group about one another, usually with the smaller units about the larger. These groups form stratifications and axes, and it will be found that a large proportion of the ornament applied to architecture is devoted to accenting these stratifications and axes. All decoration of string and belt courses and entablatures belong to the stratified type, while decorations of columns, pilasters, piers, mullions and many of the terminal forms belong to the type upon axes.

The decoration of the surface of a building is of minor consideration, and is merely to give scale, tone, or colour to the mass. As a building is made up of

Cells,

the main axis of each cell is its centre line, and therefore upon a void and not upon a solid or wall line; and because of this fact, and also that all architecture has grown either from the single cell or from a group of cells about the central one, the main axis of the majority of buildings is upon a void, not upon a solid; and as walls are above walls and cells above cells in ordinary construction, voids come naturally above voids, and openings are over openings on the same axis. So much is this the custom, and so long has it been felt to be an expression of stability which it is unwise to violate, that the axiom, solids above solids and voids above voids, has become universal in architectural design as far as construction will permit. When, as in the Ducal Palace in Venice or in the arcaded streets of Bologna, plain walls with comparatively small openings are carried upon supports, both the columns and lintel carrying such walls are given strong and vigorous treatment and the walls above as light a treatment as possible, either by texture or by delicacy of detail; and this is the mere common-sense of design expressing stability. As far as stratification of exterior is concerned, the wall is divided into storeys and has a crown or termination, and ornament is associated with the belt courses and cornices.

The Consideration of Least Importance upon the exterior of a building is the decoration of its broad surfaces, which in most cases are best left plain. If, however, for purposes of scale, tone or colour these surfaces are to be decorated, they become an all-over pattern, either a diaper or of parallel bands or forms suggested by the material of which the surface is built; for instance, if of brick the patterns are based on checkers or are stratified; if of stone, they accent each stone at either horizontal or perpendicular joints, or both; if of shingles or other lapped covering of small pieces, scale patterns are suggested. The most prolific motives are those of the so-called rustication of stones in which each joint is moulded, and borders are carried around the edges of the stones; the wall may also be stratified by projections and mouldings. The surface patterns upon the stones should be small in scale and even in tone.

Floor Treatment.

Floor patterns should be in one level plane, giving no impression by form, tone or colour of depression or projection. For this reason strong contrasts of tones, unless

352-354, OXFORD STREET, LONDON, W. GEORGE HORNBLOWER, F.R.I.B.A., ARCHITECT.

These premises have just been completed for Jane Mason & Co., whose business was carried on for many years in the old buildings pulled down last spring. The drawing shows the front portion of the new premises, in Portland stone, with shop front and first floor arcade in teak. Messrs. Hall, Beddall & Co. were the contractors. The internal fittings on the ground and first floors were executed in oak to the architect's details by Messrs. Sage & Co., and the carving to the fronts was modelled and executed by Mr. J. W. Sparrow, also from Mr. Hornblower's design.

in very small scale, should be avoided, as should also all marked impressions of overlap, interlace or embossing. As many of the Oriental patterns are entirely free from these qualities they are peculiarly adaptable to floor designs.

In cases where the floor is entire it requires its principal ornament around its edge as a border to define it from the wall. Manifestly a floor should not appear to sink or to be depressed at its centre; on the contrary, it is better to have the impression of its being crowned at the centre; and as dark tones retreat, the border, rather than the centre of the floor, should be the darker, either in tone or by amount of detail.

As the floor is under foot, and as all ornament is less noticeable below than above the eye, elaborate systems of floor decoration are labour thrown away; the true purpose of the decoration of a floor being that of a foil to the remainder of the room. The ornament, therefore, should be less conspicuous and smaller in scale than that on the walls, and as the floor is seen more in perspective than either the walls or the ceiling, involved or complicated designs upon it become confused; simple geometric

systems of planning being much more satisfactory.

Wall Treatment.

In the decoration of a wall the usual effect of horizontal bands or zones is to lower the wall and to lengthen it; and this fact more than any other tends to determine the number and proportion of the subdivisions. It is evident that the narrow zones should be toward the top to avoid the appearance of overpowering weight upon and consequent compression of the lower zones, and the same reasoning causes lighter tones and detail at the top than at the bottom. The introduction of minor zones, such as superdados, sub-friezes, &c., which appear in Victorian English decoration, is unnecessary and confusing.

The main point of definition being at the base and cornice, each advances rather than retreats, and the base being below the eye receives slight attention, while the cornices become elaborate. The strength of detail, of tone, and of scale diminishes upward to avoid heaviness at the top of the wall; this should not be overlooked.

Panels.

The further treatment of the walls between openings is forced into a panelled treatment

of greater or less scale; and the wall with the greater number of openings sets the scale for the plain wall with fewer. The panelled treatment may be simple fields with borders as at Pompeii; or divided with pilasters and columns, as in Renaissance interiors; or have marked perpendicular treatment, as in the chateaux on the Loire; the surface may advance and retreat and become most elaborate in modelling and colour; but always the openings and the spaces between them set the scale. It will therefore be found that as these openings are usually higher than they are wide, unless there be a very much greater area of wall than opening, perpendicular rather than horizontal treatment is applicable to most walls of interiors; the exception being when windows are so grouped that the width of the group exceeds its height, and when openings are insignificant.

The Cornice.

uninterrupted by openings, defines the wall from the ceiling, and therefore projects at a greater or less angle. At times it is coved, carrying the wall surface over into the ceiling surface, in which case the cove is the dominant of the group of mouldings forming the cornice. If the ceiling is enriched the cornice becomes heavier in proportion to the enrichment upon the ceiling, unless the latter be frankly of panelled beams which are carried on the top of the wall, in which case the cornice is not necessary.

As the cornice is in most cases a group of mouldings, and therefore band ornament, it can be treated as a band or belt, while the frieze below it, equally uninterrupted by openings, becomes an excellent field for either continuous ornament or specialized ornament at regular intervals on axes. Cornices break naturally around projections, but it is superfluous to break them on the runs between projections except to define some axis strongly. Cornices immediately above openings require sufficient depth to appear as supporting beams spanning the opening.

Ceilings.

The decoration of ceilings depends very largely upon the importance of the room and its purpose. Usually small rooms require little ornament upon the ceiling. Rooms are naturally of two classes—those which are merely backgrounds for the furniture, &c., within the room, and those which are complete in themselves and require but few accessories; to the latter type belong the more highly ornamented walls and ceilings. The flat ceilings in one plane are practically large panels defined by the walls, and require panel treatment, *i.e.*, with borders or with centre motives, or both, care being taken that the centre of the ceiling does not appear lower than the sides. To avoid this effect the centre ornament should not have either too much projection, too large a scale or too strong a tone; and it is advisable to have the design of the border more vigorous than that of the centre.

Darker tones in the ceiling than in the walls produce the effect of a heavy ceiling, for which reason, unless there are strong supporting motives in the ceiling, such as beams from wall to wall or rich projecting divisions between panels forming a framework apparently capable of self-support, it is well to have the tone of the ceiling lighter than the wall. This is also dependent upon the apparent carrying capacity of the wall, for walls with deep reveals, indicating thickness, or with high broad surfaces, which also apparently necessitate thickness, or with pilastered or columned treatment, can carry heavier and richer ceilings than thin walls or walls pierced with numerous openings.

Borders on Flat Ceilings

come immediately in contact with the upper part of the wall, and if undefined from it by cornice lines require careful harmony or treatment with the design upon the wall,

having similar intervals of repeat; in fact, the top of the wall, the cornice and the border of the ceiling should always be designed together, not as separate designs. Corners of ceilings, contrary to those of floors, are adaptable points of interest for ornament, though liable to disturb the scale.

Beams

in ceilings must be manifestly deep enough and of proper intervals apart to carry the floor or roof above; the spaces between the beams becoming panels, subject to panel treatment. Alteration of beams, cross beams and framework patterns produce coffered ceilings of the richest type, the coffers being recessed to greater or less depth at will, and treated in the same or different tones from the framework, which takes the form of a geometric pattern extending over the entire ceiling and dividing it into panels of various shapes. When the framework becomes delicate and of slight projection, it is advisable to keep the tones of the frame and the panel near to each other; the heavier framework allowing greater contrast of tone and colour. Upon the framework, ornament is naturally placed at the juncture of the pieces of frame. Each piece of frame is a band and can be treated as such.

Vaulted Ceilings

are based on arch construction, and the lines of intersection of the arches are the salient lines of ornament, being bands, or borders, or ribs, strongest in their centre lines, and with ornament either in repose or following the lines upward. The spaces between these lines become panels of many forms, the ornament upon them being subordinate in scale or tone to the construction lines; and it is inadvisable to subdivide these panels excepting by some geometric framework or lattice of less strength than the arch lines.

At the points where the arch lines group, rich ornament can properly be placed, such as caps or corbels at the base of the lines; and bosses, rosettes, knots, pendants, &c., at the crown. Parallel bands as borders or arch lines, whether of mouldings or of flat decoration, apparently strengthen the construction; while exceedingly heavy centres in the panels apparently weaken it. Single vaulted ceilings, such as those spanned by barrel-vaults, can be heavily coffered; but all coffering of ceilings of interlacing arches requires lighter treatment to avoid violating the apparent strength of the rib lines. The tympana left by the barrel-vaults at the

HARROGATE PUBLIC LIBRARY. HENRY T. HARE, F.R.I.B.A., ARCHITECT.
(Royal Academy Exhibition, 1905.)

This library is now being erected and is expected to be finished by the end of the year. The stone used is from the Pateley Bridge quarries. Messrs. Barber Brothers, of Hampsthwaite, are the general contractors.

ASSEMBLY ROOM, SUTTON COLDFIELD TOWN HALL. ARTHUR R. MAYSTON, ARCHITECT. (Royal Academy Exhibition, 1905.)

This town hall, with fire-station attached, is now in course of erection at a cost of between £10,000 and £11,000. The assembly room shown above is planned to seat 650 persons, and has a large platform with dressing-rooms and accommodation for both sexes. It is approached by entrance and crush halls of ample width, with cloak-rooms opening from same, and a large supper-room is provided, with kitchen arrangements attached. The fire-station comprises engine-room with recreation-room over, stabling for four horses, hose tower, &c. The contractor for the work is Mr. T. Elvins, of Birmingham, and the architect is Mr. A. R. Mayston, A.R.I.B.A., of 11, Great James Street, Bedford Row, London.

end walls of the room are of unique shape and capable of specialized treatment of great interest. Vaulted ceilings do not require a continuous cornice below them, sections of the cornice forming caps or corbels at the points where the arch lines meet the perpendicular walls being sufficient.

Pendants.

Ceilings with hanging forms or pendants, as at Troyes or at Rosslyn Chapel, and stalactite ceilings, as at the Alhambra, need a strong initial background surface, manifestly capable not only of supporting itself but also all forms hung upon it; and as an arch over a span can unquestionably carry more than a beam over the same span, the ceilings are best when the background is an arched or vaulted form; in fact, pendants from a flat ceiling should be associated with a strong framework pattern upon the ceiling. In all cases numerous small pendants or stalactites are more agreeable than a few large or apparently heavy ones; and the construction scheme should be carefully worked out in the mass before the detail is applied. The form of the pendants should decrease downwards and partake of the character of hanging forms, not of mere masses fastened as a deadweight upon the surface. It is not unusual to find such forms at a point of departure for chandeliers, &c., from the midst of a plain surface; and in most cases they are unsatisfactory, the tubing or rods of such fixtures appearing lighter when piercing the heart of a flat ornament, such as a rose or circle. The Oriental stalactite ceilings are extremely interesting; they are built of a series of carefully related units, each of which does its work in supporting those about it.

Pendants from keystones can be heavier than at other points, for obvious reasons.

NOTES ON RUSSIAN HOUSES.

THE timber-built dwellings of even the richest landowners in Russia lack the picturesque construction familiar to travellers in Switzerland, Norway and Sweden. The walls are generally formed of square beams from 1ft. to 1ft. 6ins. thick, laid one on the other and neatly joined at the corners. They are fastened together by wooden bolts, sometimes 3ft. long, driven in at short intervals. The interstices are made air tight with moss saturated with pitch, then dried in the sun, and the whole is covered inside and out with a sheathing of thin planks.

The old houses have thatched roofs, like those of the peasant's cottages, but more modern dwellings are shingled. The rooms are almost always lofty, and some of them, notably the drawing-room and the dining-room, are of large dimensions. The plaster walls are tinted with a wash of some light shade for the drawing-room and bedrooms, and a darker one, possibly brown, for the dining-room. The furniture is simple, often home made, or, as is frequently the case of late years, one of the cheaper varieties of American and English manufacture.

Underneath the building is a great store equal to the house in area, and divided by partitions. The central space is occupied by a bed of carefully dried sand, in which are planted roots to be used during the long months of winter—parsnips, carrots, turnips and the like. Huge casks and barrels filled with salt beef, fish, half-fermented cabbage and beetroots are kept here also, and these form an important part of the winter diet.

Buildings in St. Petersburg.

In St. Petersburg the height of private buildings, irrespective of the number of storeys, must not exceed the width of the street on which they are erected. Height is

limited by the distance from the pavement to the point where the roof begins. In public places and open spaces, as well as streets more than 77ft. wide, private buildings for living purposes must not be higher than 77ft. In case a building is erected on the corner of two streets of different widths its height can be the same on both streets, even if such height should exceed the width of one or the other street. The least height permitted for any building, irrespective of the width of the street on which it is erected, is 12ft. 9ins., on the following basis:—(a) In those parts of the city which were not inundated during the flood of 1824, or where the water did not rise to the height of more than 2ft. from the pavement, permission is given for the erection of one-storey buildings to the height of not more than 12ft. 9ins., counting the height from the pavement to the beginning of the roof; counting from the pavement to the beginning of the floor, 2ft. 4ins., and from the floor to the roof, 10ft. 5ins.; (b) in those parts of the city where the water stood more than 2ft. above the pavement the foundation must be carried to the height of 7ins. above the water line of the floor, and the storey of the building must have a height of 10ft. 5ins., counting the height from the floor to the roof.

The R.I.B.A. Report on Brickwork Tests conducted in 1895-7 by a sub-committee of the Science Standing Committee of the Royal Institute of British Architects has just been published in volume form, price 6s., from the offices, 9, Conduit Street, Hanover Square, W. These well-known tests have been summarized in "Specification" for years now, but we shall take an opportunity of referring to this volume more in detail next week.

THE PLACE OF SCULPTURE.

THERE seems to be much agitation in Liverpool art circles over what is described as a boycott of the autumn exhibition at the Walker Art Gallery by the whole body of sculptors in this country. . . . The position of affairs has apparently been brought about by a disagreement between the Arts Committee of the City Council and the executive of the Society of British Sculptors. This society, which has been recently founded to safeguard the interests of our sculptors, made a demand that special accommodation should be provided in the gallery for the examples of sculpture contributed to the exhibition, and that the sculptors should be represented on the hanging committee. As the Liverpool authorities were unable or unwilling to agree to these conditions, the members of the society declined to send their works to the gallery or to take any part in a show which did not offer them the opportunities they desired It is, on the whole, a fortunate matter that this question of the proper treatment of sculpture in public exhibitions should have been so effectively brought up. Sculpture has been too long trailed ignominiously at the heels of paint-

ing It has now taken the place to which it is entitled in the very forefront of the arts, and it has a right to demand the fullest consideration from the promoters of exhibitions. . . .—"Globe."

Sculpture at the new War Office.

Mr. M. H. Spielmann takes up the same attitude in an article in Saturday's "Daily Graphic" on the sculpture by Mr. Alfred Drury, A.R.A.—the pupil of Dalou—at the new War Office in Whitehall (of which the late Mr. William Young was the architect). The most satisfactory feature in the revival of the plastic art is, he says, the enormous amount of good work in decorative sculpture which is now being executed all over the country for the embellishment of buildings—the sort of sculpture which everyone can see, and possibly appreciate in its close relation to architecture. Not a few of our leading architects, such as Mr. Colcutt, Mr. Belcher and Sir Aston Webb, have taken special pride in securing the union of the two arts, so that we lately witnessed not only sculptors of the grade of Mr. Thornycroft and Mr. Frampton, but many extremely accomplished and able men of non-Academic rank, such as Mr. Stirling Lee, Mr. Derwent Wood, Mr. Turner, Mr. Hodge, Mr. Hampton

and Mr. Bertram Mackennal, engaged in decorative work for the exterior of public buildings, and even of private houses.

"The opportunities offered by our new national offices and similar edifices are obvious enough, but they have not always been seized. When the Foreign Office was erected Mr. Armistead was commissioned to fill all the spandrels facing Whitehall, and admirably he fulfilled his task. On the other hand, pedestals intended for statues are too often left unoccupied, and empty niches cry out for the figures which a false economy has suppressed."

Referring to the War Office, Mr. Spielmann says: "For this great national building, which the architect did not live to see completed, Mr. Drury was commissioned to execute four colossal groups . . . and he has gone, probably, far beyond what was expected of him by revealing a power of thought and invention, and a capacity of handling a big conception realized on a big scale, of which his previous charming work had given promise rather than proof. He has thus justified himself and the selection of the authorities in the vast personifications of Peace and War, which, seated in Michael Angelesque juxtaposition, decorate the angles and side faces of the building. . . . The figures are more than double life-size, and when I saw them in the clay in the great studio erected for the sculptor on the site of the new buildings, I was impressed by the masterly ease of the treatment and the breadth of the modelling, accurately suited to work destined to be viewed from a distance. One thing is inexplicable—the introduction (by the architect, it is to be presumed) of the Royal crown, realistically fashioned, surmounting the pier between the figures, out of all harmony with the sculptor's manner and style—a lumpy form that detracts in some measure from the artistic completeness of the whole."

OUR PLATES.

THE following are some particulars of the residences erected on the Grass Park Estate, Finchley, N., from designs by Messrs. Bennett & Richardson, architects and surveyors, of 2, Broadway, Church End, Finchley:—

"Freston Tower" is situate in Hendon Avenue. The materials used are red facings for the ground floor with stone dressings, the first floor being carried out in half-timbered work with rough-cast panels and weather-tiling. The roofs are covered with Broseley tiles. The drawing-room of the house is decorated in Louis XIV. style, and the dining-room, billiard-room and hall have ceilings panelled with heavy beams: the flooring to these rooms being oak parquet. The house is heated throughout with hot water, in addition to "Gipsy" well fires. Messrs. Patman & Fotheringham, Ltd., were the contractors.

"Rookwood," is built with red sand-brick facings and half-timbered work with rough-cast panels on the first floor. The roof is covered with Broseley tiles. The two oriel windows to the staircase are glazed with stained glass. The floors of the dining-room and the hall are laid with oak parquet and polished. The ceilings to the reception rooms and hall are panelled. The stabling at the rear of the garden has accommodation for three horses, harness-room and large coach-house and coachman's rooms above. Messrs. Patman & Fotheringham, Ltd., were also the contractors for this house.

"Rozel" is in the same avenue as "Freston Tower" and "Rookwood." The materials used for the exterior are red-brick facings with lime-dash rough-cast and weather-tiling. The roof is covered with Broseley tiles. Messrs. Walter Lawrence & Sons, of Waltham Cross, were the contractors.

NEW PORCH, ST. MARY'S CHURCH, LANCASTER. AUSTIN AND PALEY, ARCHITECTS.

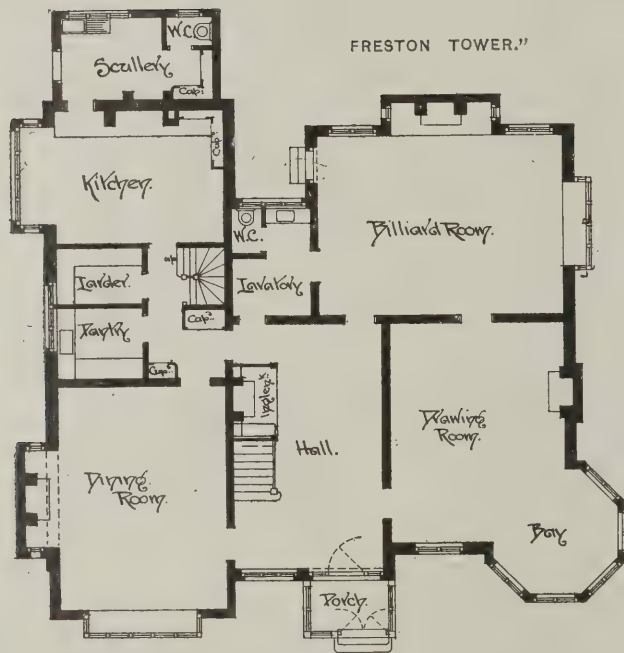

This porch takes the place of a very inadequate one of debased design. It was designed by Mr. H. J. Austin, the porch being the gift of his wife, who erected it in memory of her parents. It is built of a mixture of Lancaster, Darley Dale and flecked Ru corn stones, harmonizing in colour with the adjoining old aisle wall. The room on the first floor is used as a library, and is approached by a circular turret stair. The ceiling below is stone-groined with carved bosses. Over the doorway is a niche containing figures of the Virgin and Child; a carved head of Edward VII. is introduced into the corbel under same, the porch having been erected in Coronation year. The work was carried out by the executors of Mr. W. Harrison, Lancaster.

TINTERN ABBEY.

Stonework of the Great East Window
Reset.

DURING the past year a considerable amount of work has been carried out at Tintern Abbey under the supervision of the architect, Mr. F. W. Waller, for the Crown. Most important has been the work connected with the great east window. After a careful examination of this window, it was found that the walls and buttresses, the jambs and arch, and the gable over, though much affected by weather, were on the whole fairly substantial and not much out of the perpendicular, but the large centre mullion and the remains of the tracery in the head of the window were in a very dangerous state. The large mullion was built in two sections, the outer half being of hard stone and the inner half of stone of a much softer character, and these were bonded at long intervals by a few narrow through stones. The mullion was much out of upright and had been supported by an iron stay. The large stones forming the main outlines of the tracery above had sunk and twisted out of place, and the joints had opened to such a degree as to occasion surprise that the stonework still remained in position, and especially so in view of the weak and unreliable state of the mullion beneath, which constituted the sole support. The utmost care and consideration were bestowed upon the problem of how best to deal with the stonework with a view to its permanent preservation without alteration or addition; a number of different schemes were drawn out and discussed, and ultimately what appeared to be the only thoroughly satisfactory solution of the difficulty was adopted—namely, the stonework was reset. Most fortunately, some pieces of the main tracery which had fallen were found; thus it was possible to complete the large ring in the head of the window as formerly existing, and at the same time add to the stability of the whole. The gable above and window therein and walls adjoining have been protected and pointed to exclude wet, and the whole work has been effected without any structural change or alteration in appearance, which is matter for much satisfaction, considering the unique character of Tintern Abbey and the history enshrined in its walls.

Transepts.

In the south transept and north and south aisles the sills of windows have been repaired and reset where necessary, and much needed works have been carried out in connection with the preservation and repair of the refectory and the readers' pulpit therein, the lavatory and the walls adjoining, and the kitchen and other offices. The important work to the sacristy, begun in 1904, has been safely and satisfactorily completed, as also that to what now forms the public entrance to the building.

A large amount of very important work still remains to be done, the most pressing being that in connection with the eastern arch of the tower, which is much crippled and out of place; its fall might be productive of almost irreparable damage.

Competitions.

Holy Trinity Church, Failsforth, Manchester.—The design of Mr. Frank Freeman, of Bolton, has been selected and approved.

Library at Greenwich.—A competition is to be held for a branch library at Greenwich on the site of Bexley House. Mr. A. W. S. Cross, F.R.I.B.A., will be the assessor.

Carnegie Library, Burntisland.—Mr. William Williamson is the successful architect for this library, which is to cost £3,500. Mr. Washington Browne was the assessor.

"IRVINGTON," MILL HILL, LONDON, N.W. BENNETT AND RICHARDSON, ARCHITECTS.

This house is built of red facing bricks on the ground floor, with half-timbered work with rough-cast panels above. The roof is covered with Broseley tiles. The billiard-room and dining-room ceilings are panelled out in Oregon pine beams, and the staircase is executed in the same wood, but stained a dark oak colour and finished with egg-shell varnish. A verandah is formed on the east side of the house, affording a splendid view of the surrounding picturesque country. Messrs. F. Gough & Co., of Hendon, were the contractors.

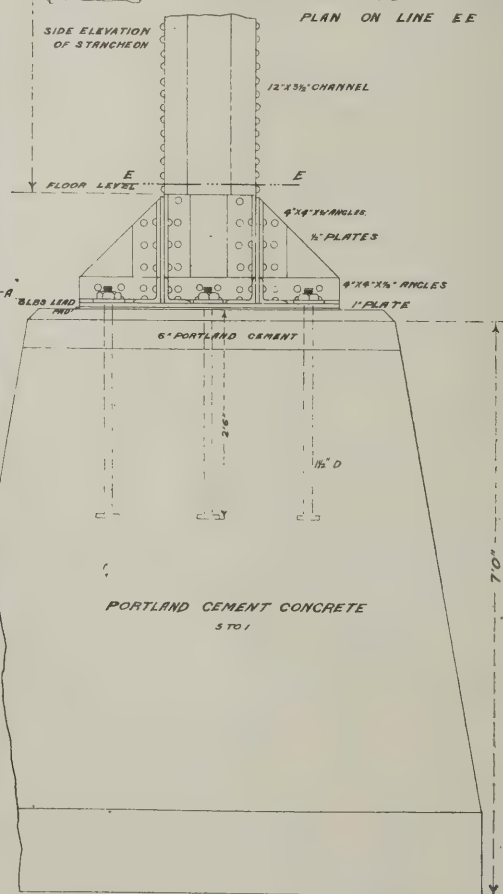

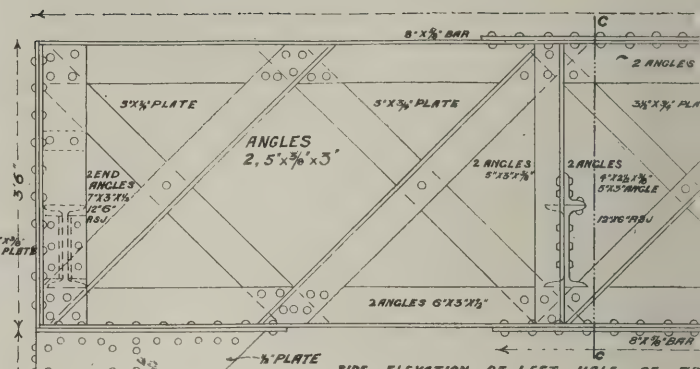

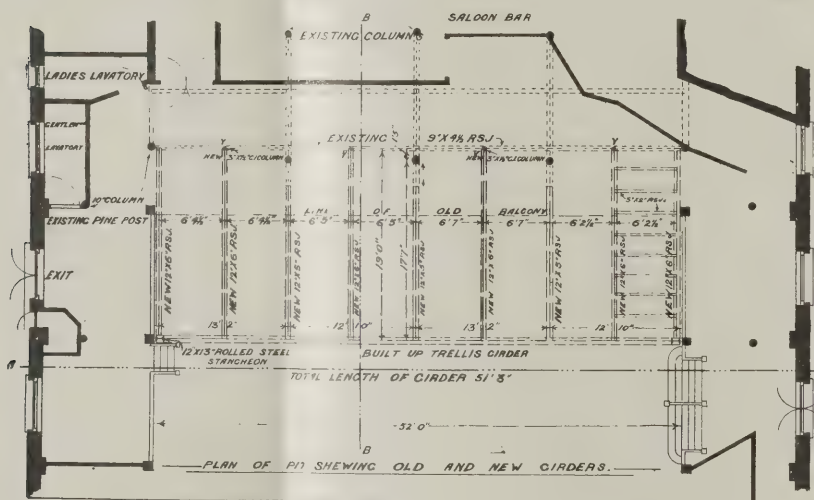

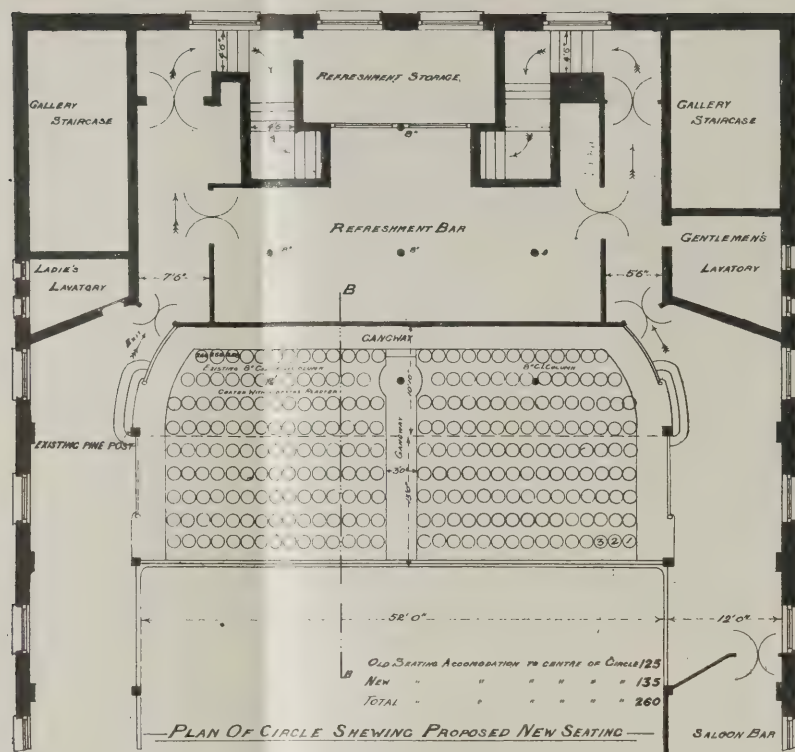

THEATRE ALTERATIONS.

THE sheet of details on the next two pages illustrates the alterations at the Grand Theatre, Brighton, which have been carried out by Mr. J. W. B. Blackman, P.A.S.I., architect, of Brighton. This theatre, formerly called the "Eden," is in North Road. It is of rather old construction, and a good deal of woodwork still remains, although the place has frequently been altered and improved; years ago it was used as a circus. The present lessee, Mr. E. Carpenter, has made many improvements, and just before Christmas, 1904, wished the circle to be brought forward 13ft. beyond an existing 6ft. cantilever to the pine posts shown on the accompanying plan, this giving extra seating accommodation for 135 people. The lessee insisted that there would not be any obstruction to interfere with the view of the stage from the pit, and the only way to get over the difficulty was to put a trellis girder across, with a clear span of 52ft. Such a girder was therefore built (as per detail) and supported at either end by rolled steel stanchions. Cross-girders 10ft. long were then fixed from the existing girders to the trellis girder and jointed as shown. The town authorities insisted upon the small cast-iron columns, y, though the architect considered that they were not necessary. A concrete floor 19ft. by 52ft. was set over the whole of the new area, and rolled steel joists 5ins. by 2ins. were laid 2ft. apart and encased with 5 to 1 ordinary coke-breeze concrete. All new steelwork was cased in asbestic plaster. The trellis girder

and stanchions were first covered with expanded metal, and the plaster then floated and set on it. The trellis girder acts as a front board to the circle. The architect estimated the total live and dead loads at 56 tons. The vertical member in the trellis girder was not taken into account in the graphic static diagram, as it was only put there to fix the cross-girders to.

With regard to the detail of the joining of the rolled steel joist marked x on plan, a query might arise why this was done. The existing girder was securely fixed to columns which supported part of the gallery above, and these could not be removed without great expense. The old cantilevers were cut off and jointed as shown by the detail. Some depth had to be gone down until the architect was satisfied with the foundations for the stanchions, as made ground and the remains of an old road were found. The stanchions were not put on a stone base, as usually done, but on 6in. Portland cement and sand 1 to 1 and 8 lbs. lead pad. The reason for this was that the workmen had very little room to work, as they were under two old floors and might not bed a large pad stone quite evenly, and the architect did not want to risk a crack by reason of uneven bedding. The contractors for the work were Messrs. Reed & Son, Ltd., ironfounders, &c., of Brighton.

The new Town Hall and Council House at Walsall was opened last Wednesday. It has cost £101,000. Mr. J. S. Gibson, F.R.I.B.A., was the architect.

Keystones.

The Strand Theatre is to be pulled down to make way for a station on the Great Northern, Piccadilly and Brompton Railway.

Change of Address.—Mr. Henry Hall, F.R.I.B.A., has moved from Doughty Street, W.C., to 20, Quernmore Road, Stroud Green, N. (Harringay station).

The Bingham Public Library at Cirencester was opened on Thursday. Mr. V. A. Lawson, of Cirencester and Stroud, was the architect. The total cost will be about £50,000.

The Obelisk in St. George's Circus, Southwark, recently removed to make way for a clock tower, has now been carefully re-erected in St. George's Road, not far from its old home.

"Gas and Oil Power."—The first number of this new illustrated monthly review for factory owners and other power users will be issued shortly. The offices are at 19, Ludgate Hill, London, E.C.

A new Police-station has been erected in Alexandra Road, Newport Mon., at a cost of £4,400. The contractors were Messrs. D. Richards, Ltd. Mr. C. F. Ward acted as architect, under the supervision of Mr. R. H. Haynes, the borough engineer.

New Municipal Buildings at South Shields.—The foundation-stone of these buildings, which are estimated to cost £48,000, was laid on Wednesday last. Mr. Ernest E. Fetch, A.R.I.B.A., of London, is the architect and Messrs. Robert Neill & Sons are the builders.

At Buckingham Palace an electric lift has been erected from what is known as the equerries' entrance to the upper floors. For many years, although repeatedly asked to do so, the late Queen would not permit this kind of alteration, but the demands of convenience have prevailed of late, and at least two lifts have already been fitted in the Palace.

His Majesty's Theatre, where a crack has developed in the wall above the proscenium of the stage, necessitating Mr. Tree's removal to the Waldorf, was designed by the late Mr. C. J. Phipps, and was the twenty-fourth for which he was architect. The builders were Messrs. Lovatt, of Wolverhampton, and the foundation work was done by Messrs. Patman & Fotheringham, Ltd., who now have the work of reinstatement in hand.

New Garden City.—Letchworth is likely to have a rival close at hand. The young Earl of Lytton has decided to develop the village of Knebworth by selling the land in small freehold plots for building purposes, and at the same time offering exceptional terms and deferred payment. The portion of the estate so dealt with is one of the prettiest and most interesting parts of Hertfordshire. The first plots of land were sold on Thursday. High prices were realized, reaching to £400 an acre and nearly £2 a foot frontage.

Mr. Waterhouse's Bequests to His Pupils.—To his "present and former pupils, in grateful recognition of their efficient and willing services," the late Mr. Alfred Waterhouse, R.A., left the following legacies:—Robert Ardley and George Tunstall Redmayne, £1,000 each; Alfred Spice, £500; John Willey, £300; George Steane, Isaac Steane, F. Herbert Mansfield, James Grosse and G. H. Shackle, £200 each; Winter Henry Raffles, the Rev. Ernest Geldart, Alfred Grosse and S. Powell, £150 each; Brightwen Binyon, Wilfred Hardcastle, G. R. Tatham, G. H. Gordon, John B. Gridley, Arthur Flower and Victor Flower, £100 each. By the first codicil to his will he bequeathed £1,000 to T. Frederick Pennington, but this is revoked by the second codicil, as Mr. Waterhouse intended to give this sum to his assistant during his lifetime.

Bristol Society of Architects.—Mr. Richard C. James, A.R.I.B.A., of Eagle Insurance Buildings, Baldwin Street, Bristol, has been elected hon. secretary and treasurer in place of Mr. H. Dare Bryan, resigned.

The fine Bronze Statue of the late Sir John Millais, R.A., executed by Mr. Brock, R.A., has been completed, and is now temporarily placed upon a pedestal in front of the Tate Art Gallery on the Embankment at Pimlico.

Partnership.—His uncle having retired, Mr. W. Hilton Nash, F.R.I.B.A., now carries on practice conjointly with Mr. Theo. Gregg (successor to the late Mr. Ebenezer Gregg, F.R.I.B.A.), at 1A, St. Helen's Place, Bishopsgate Street, E.C.

British School at Rome: Government Grant of £500.—The Board of Treasury has consented to propose to Parliament a grant of £500 to the British School at Rome, thereby extending the same support as that which for ten years has been given to the British School at Athens.

The Albemarle Hotel in Piccadilly, which is of terra-cotta and was designed by Messrs. Ernest George & Yeates, is now being cleaned by the Steam Brush Co., of Bloomsbury Square, W.C. A main pipe is brought out from the interior, and attached to it is a flexible hose, which is operated by a workman seated on a travelling cradle.

Kingsway—the new thoroughfare from Holborn to the Strand, with its crescent Aldwych—will be opened by the King on October 18th. The estimated gross cost of the improvement, including paving and other works and the cost of providing sites for rehousing purposes, is £4,893,750; while the estimated recoupment to be obtained by the sale of surplus land is £4,119,550; thus reducing the estimated nett cost of the scheme to £774,240. It is calculated by Mr. Maurice Fitzmaurice, the engineer, that at least 200,000 tons of earth and gravel have been dug out and carted away.

The Church of St. Erkenwald, at South-end, which is built on the highest part of the town and forms a conspicuous landmark from the sea, was dedicated on Thursday last. It accommodates 800 worshippers and consists of a nave of four bays, with a north aisle and morning chapel, a chancel of two bays and vestries. The nave and chancel are each 30ft. wide and 60ft. high to the apex of the vault, and the length is 126ft. A gallery has been introduced at the west end, and a wrought-iron screen marks the entrance to the chancel. The tower has not yet been added. When completed the total cost will be £15,000. Mr. Walter J. Tapper was the architect. Drawings of the interior and exterior of the building were exhibited at this year's Academy.

The new Workhouse Infirmary at Leicester was opened on Thursday. It is situated at North Evington and has cost £120,000. The infirmary is one of the largest in the kingdom, and will accommodate 520 patients, with provision for the erection of three additional pavilions, increasing the total accommodation to 900 beds. At present there are four ward pavilions, each 330ft. long and containing the following accommodation on each floor:—Two twenty-eight bed wards, two three-bed wards, two one-bed wards, two large day-rooms, two nurses' duty-rooms, with larders, and the necessary bath-rooms, lavatories and sanitary offices. The buildings have been heated by Messrs. Moorwood, Sons & Co., of Sheffield, under the patents of the Atmospheric Steam Heating Co., of London. The general contractors were Messrs. William Moss & Sons, of Loughborough (whose tender was for £79,575), and the architects were Messrs. Giles, Gough & Trollope, of London, their design having been selected in open competition.

The Staines Reservoir Communication Works were visited recently by the Junior Institution of Engineers. The members were shown round by Mr. Joseph Francis, the engineer, Mr. C. W. Pettit, representing the contractors (Messrs. John Aird & Sons), and Mr. Durham, of the Metropolitan Water Board. From the Staines reservoir intake the water will flow into a suction tank (one million gallons capacity), from which it will be pumped to a height of 24ft. into two subsiding reservoirs (300 million gallons joint capacity). Thence it will flow through 42in. pipes to the filter-beds, twelve in number. Sand-washing apparatus is provided and settling-tanks and coke-filters for treating the sand-washing effluent water before its delivery into the Thames. The filtered water will be pumped through a 42in. main to Cricklewood (13½ miles), where it will be again pumped 3¼ miles to a service reservoir at Fortis Green, Finchley, at a level of 298ft. above O.D. The engine-house at Kempton Park contains two first-lift engines, three second-lift engines and eight boilers.

South-western Polytechnic.—The lectures on architectural history given by Mr. Banister Fletcher, F.R.I.B.A., at this polytechnic in Manresa Road, Chelsea, during the past session have been very successful. Forty-seven students entered for the course, and at the examination held at the conclusion eight students satisfied the examiner (Prof. W. R. Lethaby, of the Royal College of Art). The names of the successful students are:—*William H. Champion, *Claire Gaudet, Herbert L. Jenkins, Alec Leman, Frank L. Fitness, Thomas G. Jackson, Oliver H. Kennedy and *Herbert Thatcher. (Those with an asterisk against their names received in addition a certificate of merit entitling them to compete for the sessional certificate in honours.) The scheme of instruction consisted of weekly lectures (at which carefully selected notes were given out), illustrated with lantern slides and specially-prepared large lecture diagrams, followed by sketching classes and further explanations of the styles. Large folio reference books of each style were supplied to the class after every lecture. In connection with the present course (which opens to-day at 7 p.m.) a series of visits to important buildings and museums around London is being arranged.

Obituary.

M. Charles Lucas, of Paris, honorary corresponding member of the Royal Institute of British Architects, died recently, aged 67.

Mr. John Melvin, architect, who died suddenly at Alloa on Saturday, was responsible for many of the chief buildings in the district.

Mr. H. G. Luff, F.R.I.B.A., of Devonport, died recently, aged 68. His architectural work included St. Barnabas's Church, Devonport, and the restoration of many churches in Devon and Cornwall.

Mr. Brightwen Binyon, A.R.I.B.A., of Bushey, died recently, aged 59. He was a pupil of the late Mr. Waterhouse, and after an Eastern tour commenced practice in 1871, retiring in 1897, when the work was continued by Mr. Frank Brown and Mr. Burgess, who had been associated with him for many years. Mr. Binyon won several competitions, including those for the corn exchange at Ipswich, Sunderland town hall, Swindon public offices and Folkestone public library. He was the architect of many schools and carried out a considerable amount of domestic work, including stables and alterations at Easton Park for the Duke of Hamilton.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

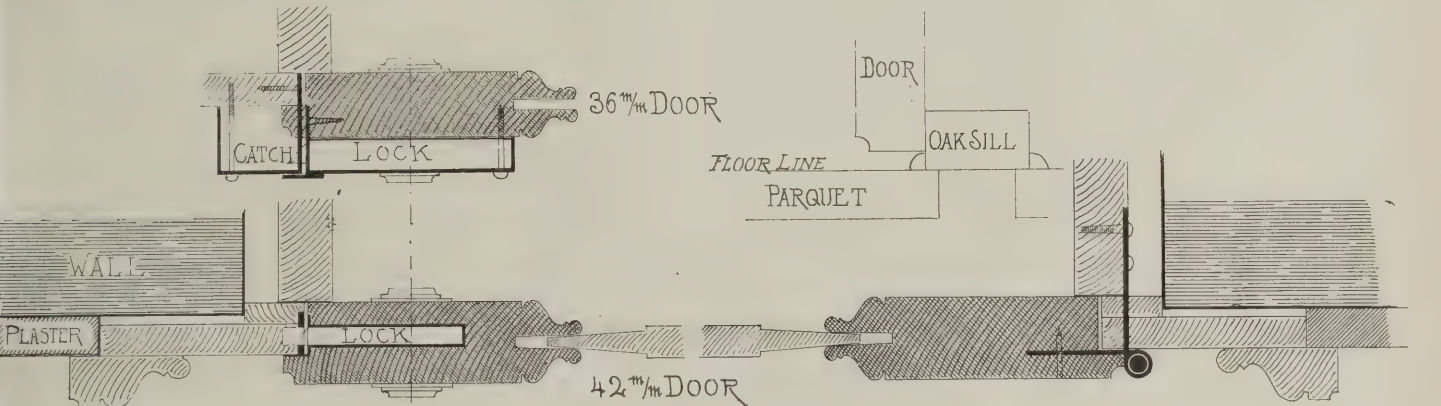

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Obstruction of Light.

Brixton writes: "The accompanying plans (not reproduced) show a warehouse recently erected by A against some house property built about thirty years ago. B agreed to allow A to run his wall to a height of 26ft. 6ins. A, however, built the walls 4ft. higher. Do you consider this extra height has affected the light to the kitchen and scullery and rooms over? Also, do you think the erection of A's wall has seriously affected the kitchen and scullery windows? A has offered to cover the wall facing the scullery with white tiles. You will note A's wall is on the north side. There was not previously any building on the site of the

DETAILS OF DOORS AS USED IN SWITZERLAND TO PREVENT DRAUGHTS.

warehouse, but trees to a height of 15ft. or 18ft."

This seems to us a case of the last straw and the camel's back. There is no doubt that the original wall must have very much obstructed the light to both kitchen and scullery, though much the more seriously to the latter. The extra height proposed will make little real difference, though where the light is already bad every little addition for the worse is of importance. We consider the offer of the white tiles is a fair one, and should make both rooms better than they were before, but we would also offer to provide prismatic glass in both the top sashes, which would greatly improve the property and ought to overcome all objections.

A Bakehouse Chimney.

Farnham.—A. J. S. writes: "A bakehouse chimney shaft is required to be raised a few feet. Is this practicable according to sketch (not reproduced); and if so, how many feet could it be carried up with safety?"

By the London Building Act, which is a good guide for any other neighbourhood, a chimney stack should not be carried more than six times its least dimension above the roof without being stayed. The chimney submitted is already just over this height, so that it cannot be raised without considerable risk, as there do not appear to be any ready means by which it can be stayed with sufficient rigidity to be useful.

HENRY ADAMS.

Area and Air-space in Portable House.

LITTLEHAMPTON.—ERIQUE writes: "What superficial area and cubical air-space would be required for a portable house to seat about 200 people?"

The space allotted to each person should be not less than 2ft. 4ins. by 1ft. 8ins.; the gangways should not be less than 3ft. wide. The cubical air-space will depend upon the system of ventilation adopted; we presume that in this case the so called "natural" system is proposed. At least 300 cub. ft. of air-space should be allotted to each person.

Doors in Swiss Houses.

LONDON.—H. E. W. writes: "I understand that in Swiss houses the internal doors are rebated in some way in order to lessen the draught. A client of mine wishes to adopt the same system for some of the doors in his new house, but is not quite clear as to how it is done. Can you give a sketch and an explanation of the method?"

The accompanying details, by Mr. Alexander Koch—who has carried out much architectural work in Switzerland—will serve your purpose. They do not need any description. We may mention, however, that it is usual in Switzerland to have a sample door made for every building and to order the fittings to suit it. Mr. Koch advises that the same course should be adopted in your case,

surrounding plots it has then no right of lateral support in respect of that raised part.

S. P. J. M.

Sale of Building Land.

COLWYN BAY.—WALES writes: "(1) Is it usual for the vendor of a plot of building land to supply the abstract of title? (2) A, as vendor, chooses to act for himself in the sale of building land—that is to say, when the solicitor for the purchaser writes asking to see the vendor's deeds or title the vendor lends the purchaser's solicitor the deeds, as he thinks to prepare the abstract, when he receives from the solicitor a list of requisitions which the vendor answers himself, and to the satisfaction of both purchaser and solicitor. Now that the purchase is completed, the solicitor sends in an account to the vendor, as he says for supplying abstract of title. Considering that the vendor did not give any instructions whatever, is he responsible for the above solicitor's charge?"

(1) Yes, the vendor should supply the abstract of title. (2) I understand the case to be that the vendor merely handed over his deeds to the purchaser's solicitor and employed no solicitor himself. The purchaser and his solicitor concurred in this (rather loose) arrangement, and the matter is now at an end. I am of opinion that in the circumstances no costs can be recovered from the vendor. F. S. I.

Harrison's Graded Scale Curves.

BONCAVE writes: "What advantages have Harrison's graded scale curves over ordinary French curves? I understand they are all the same shape but of different sizes. What is the object of this? I think a description of the curves would interest and be of use to many readers."

These curves were designed by Mr. J. Harrison, M.I.M.E., A.M.I.C.E., Wh.Sc., so as to give the most generally useful results in practical work. They are mathematically calculated. At one end the curve is very flat, at the other it is almost circular. Beginning at the flat end the curve gets more and more convex, gradually and continuously to the circular end, and at no point becomes flatter, like most other French curves, which interferes to some extent with their general utility. These curves are made in a series of four, 5ins., 8ins., 10½ins. and 13½ins., in pearwood, "pellucid" and "velo veneer," and they cost rs. 6d. the set in the first-named material and 10s. in the other two. They are supplied by Mr. A. G. Thornton, of Paragon Works, King Street W., Manchester.

Revolving Ventilator for Meal Kiln Roof.

DUNFERMLINE.—J. B. writes: "Please give a sketch of a revolving ventilator for a meal kiln roof. There is an old-fashioned one shaped like a cone, but is there any newer style?"

Where fans are employed cowl is no longer necessary, but in cases where natural

VENTILATOR FOR MEAL KILN ROOF.

draught is used for kilns there is nothing better than the old arrangement of conical cowl. The accompanying sketch, not to scale, shows how such is made. The chief part of the construction is the "pole" which carries the superstructure and on which it all revolves by means of a collar at the top of the kiln dome and an iron pin pocket joint of stout character carried in the bearing beam, which is fixed for that purpose in the upper part of the kiln. This pin bearing should be oiled, and if a sinkage takes place it is necessary to block up the cowl at this point (a marble in the socket often forms the best bearing). The "back" of the cowl carries rings of timber (made like the rings of a sinking kerb for a well), and to these $\frac{1}{2}$ in. wooden sheathing is affixed (by copper nails in kilns where sulphur is used). The sheathing must start on each side at the front. Each board should "weather" over its predecessor and the last at the "back" should cover the last pair. This is to prevent wind entering at the joints. The "tongue" is of course intended to keep the opening of the cowl to leeward and so to prevent draught.

F. S. I.

Honours, Building Construction.

LONDON.—J. H. S. writes: "The Board of Education have the following new regulation regarding their examination in Honours, Building Construction: 'No candidate will be credited with a success in this examination who has not obtained a previous success in stage 3, or in honours of the same subject, and who does not qualify in the Board's examination in architecture.' Would a second-class certificate in architecture be considered sufficient qualification by the Board?"

A second-class certificate in architecture is a sufficient qualification to enable a success in Honours, Building Construction to be recorded.

HENRY ADAMS.

Removing a Church to Another Site.

T. T. (Liverpool) writes: "Referring to the replies on this subject, two churches within my knowledge were removed and re-erected as 'A. L.' mentions. They were both in Liverpool. One, a church of England, is now on a site in Crown Street. This was removed from a site across the street, about 150 yds. away, to admit of the opening-out of part of the main-line tunnel of the London and North-Western Railway from Lime Street Station to Edge Hill. The other church now stands on a site on the north side of West Derby Road, near Tue Brook, and is known as Tue Brook Wesleyan Chapel. This building was removed from a site in Bootle about three miles to the north-west. Your querist will doubtless be glad to have these examples brought to his notice in addition to those already mentioned in your columns during the past few weeks."

A FINIAL BY SIR ROWAND ANDERSON.

THE finial illustrated below has been designed by Sir Rowand Anderson for the principal gable of the Sir William Pearce Institute at Govan. It was executed by Mr. Charles Henshaw, decorative metal-worker, of Edinburgh. As appropriate to Govan, renowned for its shipbuilding yards, the design takes the form of a ship, though an ancient example of Armada days has

been thought more suitable than a modern ship. It is fixed on a pedestal of stone and measures fully 6 ft. overall, with a width of 4 ft. 6 ins. At first the intention was to make the ship of cast bronze, but this idea was given up on account of the weight. Sheet copper was therefore chosen, which necessitated greater care and skill in construction. The framework is of wrought-iron, and every precaution has been taken to secure sufficient strength to withstand wind-pressure.

The Massive Tower Pinnacles of Bath Abbey Church, one of which was recently struck by lightning, have been taken down and are to be re-erected on a smaller scale, of which a wooden model has been set up on the base of the south-eastern one. They dated from the Gothic Revival, when it was a common mistake to make pinnacles disproportionately big. A new floriated cross has been placed on the eastern gable of the chancel. Mr. T. G. Jackson has the work in hand.

THE ANCIENT BUILDER.

What would he have done under Modern Conditions?

COMPARING ancient with modern building construction, the former could hardly be considered a science in any real sense, for it was generally, as in Egypt and Early Greece, the shaping of buildings by a homogeneous material, granite, stone or marble; having their prototype in some cases in rock-hewn caves and temples. But we now live in an age when the architect has at his command all the materials which nature as well as industrial manufacture can supply. Around many of them has grown up a special literature, and every student of applied science, every student of a technical school, and every craftsman is made familiar with the results and experiments of the most elaborate tests, which are to be found in every text-book.

What has all this analysis, classification and research done for the architectural or artistic use of these materials? Are our modern buildings equal in architectural merit or design to those of the ancients? Our answer to these questions is that we cannot compare the products of ages so far remote, which existed under such different conditions of life and habit. Analytical investigation is certainly not favourable to the art instinct in many ways, and if the experiments and conclusions of modern chemists, physicists and engineers had been known to the Greeks, Romans or mediævalists, the architecture they have left us would have been rather different, though we doubt if more perfect.

Could the Parthenon have been Improved?

The Parthenon could scarcely, under modern conditions, have been more perfect for its purpose or climate, or in the mode of lighting the cella, either by clerestory (as Mr. Fergusson thought) or by Bötticher's theory of a skylight. There was ample marble at hand, and nothing could have been gained by adopting more modern methods of wall building, and for the particular kind of religious worship in which the statue of the goddess was prominent the hypæthral temple, with its naos open to the sky, and the peripteral arrangement of the columns left nothing to be desired.

So that all our scientific research and analytical study have not had so much to do with the design of these great buildings of old; and to change of intention or motive we must look for any real difference in the design between the ancient and the modern.

What Gothic Builders might have done.

The great Gothic builders probably would have been more affected by the exact knowledge of materials we possess now, and how far the introduction of iron in their methods would have influenced them is a question. That they would have left us anything more noble or dignified than the cathedral churches of our land is also doubtful. The fact is, analytical knowledge and mechanical processes cannot in themselves inspire the creative faculties of the artist; and we must look to deeper causes—the ideals of life, modes of workmanship and religious unity and enthusiasm for any change in architectural construction.

But with the greater command of materials and processes of manufacture and the more exact knowledge we have of their properties and capabilities, there is no reason why corresponding advantages may not be secured if we look at the question in a true light. Our ancestors had only a few materials, which they thoroughly understood and used in the most direct and unflinching manner. If they did not know the chemical and physical properties of these materials as well as we do, they had a practical insight into their working, which is of far more importance

in design than the most profound analysis. They were handicraftsmen as well as designers and were more sympathetic with their materials and knew their limitations better than the modern tradesman, who has only studied his materials second-hand by the aid of books and classes. That we are gradually overcoming this defect by our system of instruction ought to be an encouragement. But we are too apt to use materials, at least the older of them, in precisely the same fashion as our forefathers, to do which we have to revert to their style first and make our reason and science come next—just the opposite way to that in which they worked. By thus reversing the order of their method we have made our art of no effect by our traditions. We have made our construction fit the form, instead of the form fitting the construction, which is the true way. Until we see this we shall go on blundering. Our better knowledge of science has at least enabled us to accomplish many things in construction.

To take a few examples, we may first mention

Our Methods of Making Foundations.

Here our scientific knowledge has certainly been a great aid to us and enabled us to erect buildings of the weightiest and loftiest kind on almost any soil—a feat which the old builders could not accomplish without the expenditure of a vast amount of material and labour. The destruction or failure of so many of our ancient church towers is a melancholy instance. Had our cathedral builders known the value of Portland-cement concrete, concrete piles, caissons and the aid of pneumatic appliances they would not have hesitated to use them; or had, even in later times, Wren used the modern methods now available to prevent the settlement of foundations due to drainage or sliding strata we should never have heard of any fractures (though these have been exaggerated) in the masonry of St. Paul's Cathedral.

The aids the architect now has to extend the bearing power of his heavy piers have made it possible to calculate for any load. Layers of dry material or stone, however hard and compacted, or lime concrete methods that the old builders resorted to, cannot be compared with a grillage of steel beams strengthened and solidified by cement concrete, as there can be no breaking away or fissuring under heavy loads, the reinforced concrete forming a solid mass stronger and more coherent than any stone.

Settlements.

The old builders knew how to distribute the weight of their structures by wide footings; but their modes of dealing with inequalities of earth resistance, wet or damp soils, lateral escape of soft soils, or running sand or peat, sliding of the substratum on sloping beds, withdrawal of water by well-sinking and drainage, were imperfect. We now have means of combating all these causes of settlement, such as by sheet piling, plank foundations, retaining walls, concrete or sand piles, and other means of obtaining a solid foundation; we use subsoil drainage before commencing to build in wet or damp sites. The modern expert can now calculate with a nicety the resistance of different soils.

Steel Architecture.

In the design of iron and steelwork an almost perfect system of construction has been introduced based on scientific principles and a knowledge of the materials acquired by experimental tests: and in this case there were no traditional rules and precedents to hamper the designer, as in the case of stone, brick or timber. Iron and steel construction has indeed formed the subject of an important literature; mathematical principles have been applied to the question till we have a body of reliable facts, experimental, mathematical and practical ex-

perience, which have placed the subject on a scientific basis unknown to any previous era of construction. All these advances in iron construction have very much specialized this branch, and have tended to keep iron and steel construction very much in the hands of a few experts who have made a particular study of it. It may be asked whether these advances have made any difference from an art point of view? Are our railway bridges and stations any better? We cannot say they exhibit any improvement in design; but the engineer is proceeding on safe lines, and it is only for him and the architect to co-operate to bring about a more satisfactory condition. The uses and limitations of these materials are now understood better than they were a half-a-century ago. But is it not time for architects to use these aids for their own purposes, and try to make them subservient to more architectural conceptions?—H. S. W. in "Architecture."

Builders' Notes.

The Bath Stone Firms, Ltd., made a nett profit of £18,509 for the half year ended June 30th last. The directors declare an interim dividend of 14 per cent. per annum, leaving £18,463 to be carried forward.

A £3,000,000 Contract.—Messrs. Hughes & Stirling, builders and contractors, of Liverpool, have secured the contract for the construction of a boulevard across the city of Madrid, to cost £3,000,000. The boulevard will be one mile and a third long.

The Jerry-builder.—First jerry-builder to second jerry-builder regarding a row of four houses, one of which has collapsed: "How is it that my 'ouse has fell? It's just the same as yours." Second jerry-builder: "Ah, but mine was papered inside."—The same facetious spirit to a prospective tenant looking over the houses: "Now you go into the next room." Shouts, "Can you 'ear me?" Answer: "No." "Can you see me?" Answer: "No." "Ah! there's walls for yer!"

Proposed Works Department for Leeds.—The special committee appointed to consider the advisability of establishing a works department at Leeds held a meeting last week, and discussed the matter. It was decided that the committee should first ascertain what other municipalities had done, and with this object four questions were formulated, to be sent to various corporations, including London, Glasgow, Birmingham, Liverpool, Manchester, Sheffield and Bradford.

Labour in the Colonies.—The Emigrants' Information Office states that it is too late in the season for the ordinary emigrant to go to Canada unless he goes to friends or has sufficient means to keep himself during the winter. In the six States which compose the commonwealth of Australia there is not much demand for more labour. New Zealand offers many advantages to emigrants both as regards its resources and its climate, and reduced passages are granted to those who possess a capital of £50. No one may enter Cape Colony unless he possesses £20 on arrival or has secured work beforehand. There is no opening for more labour, the supply exceeding the demand in nearly every department of industry. The supply especially of carpenters, bricklayers, fitters, riveters, handymen and painters at Cape Town, of men in all branches of the building and engineering trades at East London, and of men in all branches of work at Port Elizabeth, greatly exceeds the demand. At East London the wages of carpenters, bricklayers and plasterers have been reduced by 3d. an hour. In Natal labour is plentiful; neither do the Orange River Colony and the Transvaal offer any opportunities.

Decay of Stone in Glasgow.—Mr. L. W. Williams, on behalf of the Giffnock Quarries, Ltd., has asked the town council of Glasgow that a committee be appointed to enquire into and report upon the numerous cases of decay in the stones used in Glasgow buildings. He suggests that the principal buildings in Glasgow be classified, giving age and condition of stone with name of quarry appended. Certain points should be clearly brought out: (a) whether stones are laid on natural bed or on cant; (b) whether stones are dressed by hand or machine; (c) whether the stone specified by a certain quarry was all supplied by that quarry; (d) whether the stones of several quarries were placed in the one building.

THE ARCHITECT IN SOUTH AFRICA.

IN a paper on the training of architects which he read before the recent Johannesburg meeting of the British Association Mr. Reginald G. Kirkby, A.R.I.B.A., said that the old system of pupilage was slowly dying out; for as schools of architecture were being multiplied students were able to attend the classes and thus obtain a thorough grounding in the elements of their profession before entering upon practical work in the office of an architect. There was a crying need for a faculty of architecture to be fully developed in connection with university colleges, technical institutes and schools of art in South Africa, and until some additional means were provided to enable the young South African architect to obtain a proper theoretical training they could only hope to turn out rule-of-thumb men. There were practically no existing facilities for students to obtain the necessary training, although the R.I.B.A. had consented to hold examinations in South Africa.

He was glad, however, to notice that an attempt was being made by the Transvaal Technical Institute to partly meet the need, and it was to be hoped that the adjoining colonies would follow this example.

In regard to

Science in an Architectural Curriculum he said that a student should be taught the physical properties of building materials and their geological structure; he should take a course in chemistry, which would aid him to employ the materials most suitable to the various environments, and also to detect defects and impurities; acoustics (one of the most difficult branches of physics in its application), together with a knowledge of the movements of vitiated air, would enable him to understand more perfectly the principles underlying a much-neglected branch of his work; the laws of light and heat contained many applications in architecture, the effect of the latter on iron and steel structures being of great importance; while a course of magnetism and electricity would help the architect to carry out his electric-light installation in a proper manner; and it was needless to emphasize the value of a mastery of the laws of mechanics and graphic statics, for without a knowledge of these how could an architect construct? Just as a painter profited by his knowledge of anatomy, so did an architect by a knowledge of his materials, their strengths and uses.

Modelling in Clay

would be of great assistance to the student, in enabling him to judge correctly the necessary reliefs, depths and sizes of the ornaments forming part of his building. It might not be necessary for him to do the modelling or carving, but he should be able to tell when the work was well done and thus prevent the employment of sculpture which might not be in sympathy with the general design.

VIEWS AND REVIEWS.

**The Church of St. Dunstan,
Stepney.**

From what meets the eye at the present day one would judge the Church of St. Dunstan, Stepney, to be of less interest than the history of it so ably summarized by the Hon. Walter C. Pepys and Mr. Ernest Godman, who are responsible for the letter-press of this book. Within the City of London it has never been possible to have parishes nearly so large as the original Stepney, which had become so populous by 1650 that proposals for its subdivision were made, with the result that it was divided into no fewer than nine parishes between 1669 and 1820. Forming part of the Hundred of Ossulton at the time of the Domesday Survey, the Manor of Stepney was held by the Bishops of London, whose palace once stood where Victoria Park now is. Such in brief is its history. The church was thus described by John Stow:—"This church of St. Dunstone is called in the East, for difference from one other of the same name in the West; it is a fair and large church of an ancient building, and within a large churchyard; it hath a great parish of many rich merchants, and other occupiers of divers trades, namely, salters and ironmongers." Excepting a Norman rood, now in the chancel, some Early English sedilia, and one curvilinear window, the church is in the Perpendicular style, and calls for little comment; but inasmuch as it forms the temple of its memorials, besides meeting the present need, its existence should be safeguarded, and as historic buildings in general are safer to-day than they were, there is reason to hope it may be. But whatever befalls the church, there is no memorial in it that will not be preserved for all time by means of this patient survey. The monuments in church and churchyard are all reverentially listed, and, though it cannot have in all cases been easy, the arms are correctly described. Some are printed in colour, too, showing how to do that for the rest, and since there is nothing more splendidly decorative than our heraldic devices, it is delightful to have them added to these most desirable volumes. A matter which "I would touch on," says Mr. Ashbee, "is the need for some better record of London families. There is, as far as I know, no system or method by which the records of English families, much less of London families, are being preserved. Sometimes their only memento is a stray tombstone, monument or inscription in a city church, or the church of what once was an outlying suburb and is now swallowed up in the great city. If any members of the Survey or any who are interested in the preservation of English historic record would, before it is too late, catalogue and classify (somewhat in the manner in which Mr. Pepys has treated the tombs in Stepney Church) all the ancient churches of London, and the outlying suburbs within the region of the Survey, I think a very valuable piece of history would be accomplished; and I commend it to the readers of this book." E. R.

The Church of St. Dunstan, Stepney. The Sixth Monograph of the Committee for the Survey of the Memorials of Greater London, 37, Cheyne Walk, Chelsea.

WEST END.

STAIRS TO ROOD LOFT SOUTH AISLE. DRAWN BY E. L. WRATTEN AND W. H. GODFREY.

Contracts Open.

METROPOLITAN RAILWAY COMPANY. STORES CONTRACTS.

The Directors of the Metropolitan Railway Company are prepared to receive TENDERS for the SUPPLY of GENERAL STORES during twelve months ending 31st October, 1906.

Manufacturers and others desirous of Tendering should apply to the undersigned on or after the 26th SEPTEMBER, 1905, for a form or forms under the following numbers:—

No.

4. Bolts, nuts, rivets, spikes, washers, iron fencing, &c.

8. Carriage handles, hinges, locks, &c.

11. Cement, bricks, pipes, paving, slates, broken granite, &c.

19. Electric wire casings and wood wool.

27. Glass—plate, sheet, coloured, &c.

28. Handles—hammer, &c., coupling poles, ladders, scaffolding, barrows, &c.

34. Keys, trenails, wood fencing, &c.

41. Pipes—iron socket and rainwater—ra ges, &c.

42. Sand, gravel, and picked flints.

46. Timber—eals, creosoted, telegraph poles, jarrah, sawdust, &c.

47. Timber—teak, mahogany, oak, ash, telegraph arms, &c.

After the forms have been obtained, samples and patterns of articles and goods may be seen at the Office of the COMPANY'S STOREKEEPER adjoining Neasden Station, N.W., from MONDAY, OCTOBER 2nd, to SATURDAY, OCTOBER 7th, both days inclusive.

Tenders on the forms supplied by the Company only, and endorsed "Tender for ——" must reach the SECRETARY not later than TEN a.m., on MONDAY, OCTOBER 9th.

The Directors do not bind themselves to accept the lowest or any Tender.

R. H. SELBIE, Secretary.

Secretary's Office, 32, Westbourne Terrace, London, W.

EAST SUSSEX COUNTY COUNCIL. TO BUILDERS.

TENDERS are invited for the ERECTION of new POLICE OFFICES and SUPERINTENDENTS' HOUSES and ALTERATIONS to the existing BUILDINGS at Lewes, for the East Sussex County Council.

Plans, specification, and conditions of Contract may be seen, and bills of quantities obtained, after FRIDAY, 6th October next, on application to Mr. F. J. WOOD, County Surveyor, Lewes, between the hours of TEN a.m. and FOUR p.m. (Saturdays Ten a.m. and One p.m.), on payment of a deposit of three guineas, which deposit will be returned upon the receipt of a bona-fide Tender.

The contractor whose Tender is accepted will be required to enter into a Contract with the County Council and, if required, enter into a bond with two approved sureties for the due carrying out of the Contract.

Tenders, endorsed "Tender for New Police Offices and Superintendents' Houses," to be addressed and delivered to the undersigned at the County Hall, Lewes, not later than TEN a.m. on FRIDAY, 27th OCTOBER, 1905.

The County Council does not bind itself to accept the lowest or any Tender, and will not pay any expenses in connection with the preparation thereof.

F. MERRIFIELD,

Clerk of the County Council.

County Hall, Lewes,
12th September, 1905.

£750 claim paid.

The following list is interesting, as it gives particulars of some of the claims that have been paid under the BUILDERS' JOURNAL Insurance Schemes. The ease with which an accident happens, and the heavy expense often incurred by doctors' bills and loss of occupation are subjects that every thoughtful man has to consider, and there could not be a better method of protection than such Insurance policies:

Builder.—Injury to left arm necessitating amputation. £750.

Architect.—Slipped down steps while carrying bicycle. £6.

Builder.—Kicked by horse. £10 10s.

Architect.—Trod on rusty nail, which entered toe. £4 10s.

Architect.—Slipped on floor, and in falling struck arm of chair. £1.

Builder.—Injured face, left eye, and foot. £6.

Only subscribers to the BUILDERS' JOURNAL are entitled to benefit under our Insurance Schemes, which are guaranteed by "The Ocean Accident and Guarantee Corporation, Limited." A pamphlet giving particulars will be sent on request, and every subscriber should avail himself of one of the following Three Schemes of Insurance.

These are the three Schemes:—

(1) A Free Accident Insurance of £500.

(2) An Accident Insurance of £500.

And also

£250 for Permanent Total Disablement.

£2 10s. per week for Temporary Total Disablement.

Premium, 1/-

(For the conditions under which policies Nos. 1 and 2 are issued readers should refer to our pamphlet, sent on application.)

(3) An Accident Insurance of £1,000,

£500 for Permanent Total Disablement,

£8 per week for Temporary Total Disablement,

with special advantages fully detailed in our pamphlet.

The MANAGER,

Technical Journals, Ltd.,

Great New Street,

Fetter Lane, E.C.

The Parish Church of Skegby, Notts, now undergoing extensive restoration, has been ruined by the workings of a local-coal mine. The pit workings pass underneath the church at a depth of 400ft. to 500ft., and the settlement of the ground has caused the tower and body of the church to subside, the former to the extent of 6ins. After the subsidence great cracks were noticed in the tower, but the north aisle has fared the worst. The stonework of the piers has been so much disturbed that iron bands have to be used to keep it in position, whilst stout wooden beams are introduced to support the roof.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

October 11, 1905. Vol. 22, No. 557.

6, Great New Street, Fetter Lane, E.C.

Summary.

In his presidential address to the Architectural Association on Friday evening Mr. E. Guy Dawber announced that the donor of the £1,000 to the new premises fund was Mrs. Arthur Cates. Speaking of the syllabus formulated by the Board of Architectural Education, he said it would doubtless be adopted by all the recognized institutions throughout the country, and he regarded it as by far the most important step towards the advancement of architectural education that had ever been taken. The day school was making admirable progress, and was being attended by students not only from this country but by those from the colonies who came over here. Speaking of the public taste in architecture, he said that the general lack of appreciation in this country was not due to apathy or indifference, but simply to want of knowledge, and he commended the idea of the architect signing his building as being in no way derogatory to his calling any more than in the case of the painter and sculptor. (Page 204.)

A fraudulent practice exists in marking Belgian cement as "Best Portland," and selling it as such at undercutting prices. Much of it is natural cement, and does not go through the same process as the English, and in that respect is inferior. (Page 209.)

A lay critic of the Garden City describes it as a series of hen scratchings and a few advertisement places for jerry-builders; a place where all the moonstruck architectural ideas of the island seem to have been let loose. (Page 210.)

The Electrical Exhibition at Olympia offers many exhibits of interest to architects and builders. Electric motors for haulage and hoisting are shown, and numerous electric-light fittings, new lamps, radiators, fire alarms, ventilating fans, lifts, telephones, &c., are included. (Page 213.)

Mr. Perkins Pick delivered an address at Leicester last week on the decline of artistic handicraft. In all probability, he said, it was impossible to give that human interest to machine-made articles which the old handicraft goods possessed, but there was not a doubt that men of good taste could enormously improve upon the work generally produced if their services were requisitioned by those who had the power to direct the process of manufacture, for machine-made articles were not necessarily ugly. (Page 208.)

No successors to Mr. Alfred Gilbert and Mr. George Aitchison as Academy professors of sculpture and architecture respectively have yet been appointed. (Page 212.)

300 mistakes have been found in 29 contract drawings of the new Colsterdale reservoir for Leeds. One result is that the corporation have had to acquire fifty additional acres from Lord Masham. (Page 212.)

Battlements. ONE of the absurdities of modern design is the profusion of battlements, included on every possible occasion by architects who think they have a feeling for mediæval work. On the tops of porches and of bay windows and along the skylines of buildings these excrescences frown down upon us, suggestive of the time when bows and arrows were weapons. Upon modern villas, turrets are constructed sometimes with long slits for the absent archers: and one can think their only use might be as a haven where the hard-pressed tenant could retreat in dire necessity from the besieging tax collector. If the architect must decorate his skyline with a fringe, let him have resort to the decorative battlements such as we find in Venetian and Veronese work, or a modification of the Gothic cresting. These offer plenty of suggestion for pleasing modern treatment. Many of the old battlements in the mediæval towns of Italy are of brick, a peculiar type being the Scaliger or La Scala battlement. A common form in Moslem architecture is the Almena, in which a stepped slope has the uprights of the steps cut to a backward or reverse slope. This is often very picturesque, but let architects shun the copying of forms which were produced by circumstances quite different to the present; and let the fortified battlement be relegated to limbo with the split pediment and the blocked column.

After the Architect the Client. WE suppose that every architect who has been in practice for some years has had the experience of seeing considerable alterations made to his building after the client has obtained possession—not constructional alterations so much as the addition of features (perhaps small in themselves) which have a most disastrous effect on the general appearance of the building. Architects who do domestic work will recall how the interiors, on the design of which they spent so much care, have been absolutely spoiled by the introduction of commonplace furniture altogether at variance with the rest of the room. So much is this the case that we very rarely see a room where the client's taste has not been more or less unfortunate. There is a story of the late Mr. William Butterfield, who, on paying a visit to a house in the country which he had designed, found the walls overgrown with creeper, which, however generous a mask it may be for the productions of some men, was hardly desirable in the case of Butterfield, whose detail in mouldings and surface decoration was so interesting. Butterfield on this occasion had

the offending creeper cut down without asking his client's permission. We can hardly suppose that a similar procedure is likely to be within the power of ordinary architects, nor would it be desirable, and the idea of an architect having the whole of a room cleared of tasteless furniture is of course ludicrous. Nevertheless it is most disappointing when rooms are thus marred, so absolutely destroying the architectural work. We know of a case of a hospital in London to which the architect gave the greatest care, producing a most delightful building, but the trustees, when it came into their possession, quietly introduced the friendly carpenter to fit up certain woodwork in recesses in the nurses' bedrooms, and here the familiar scriggly stuff, well-varnished, made its appearance. On a larger scale we now have two instances of similar misapplication of energy, namely, the Waldorf Theatre and the new Gaiety Hotel. Everyone in London knows these buildings, and there is no occasion whatever for the former to be bespattered with large gilt letters nor for the latter to have illuminated signs and lamps spread all about it. In both cases the disfigurement is considerable and quite needless.

The Porch as a Place for Recreation. MR. GOTCH is especially interesting when describing the development of the English house of to-day. He shows so lucidly how the large passage hall was gradually restricted until the hall vanished and the passage alone remained as a communication between rooms. How comes it, then, that he should have forgotten the possibilities of the porch? In this country we are dull-witted enough to think of this only as a little place of protection against the weather, and we are once more indebted to the land across the sea for a more expansive outlook. For thus one of our American contemporaries: "The majority of people who are erecting new residences want a large porch where they can spend their afternoons and evenings in comfort. It not only makes the home more attractive but it is beneficial to the health of the occupants, as the air on the porch is purer and more refreshing than in the house. A suggestion well worth considering by those who expect to build is to have the porch extend around to the side of the house. This will prevent any inconvenience to those who wish to enter the front door when there are a number of people seated on the porch. The chairs should all be comfortable, with large arms, as the porch is strictly a place for recreation."

THE ARCHITECTURAL ASSOCIATION.

New Session Begins: President's Address.

ON Friday evening at 18, Tufton Street, Westminster, the fifty-ninth session of the Architectural Association was opened, the chair being occupied by the president, Mr. E. Guy Dawber, F.R.I.B.A.

Mr. J. J. Burnet was elected a member of the Association, Mr. Dawber observing that with one exception all the members of council of the Institute were now members of the Association and the one exception was a member some time ago. Mr. F. H. Atkinson and Mr. H. S. Sawyer were also elected members, after which it was announced that Messrs. P. L. Forbes, R. G. Elwes, A. C. R. Mackenzie and W. E. Monro had been reinstated. The prizes, medals, &c., for the past session were then distributed.

The president then delivered his address. After acknowledging their thanks to the retiring hon. secretary, Mr. Louis Ambler, and to Mr. Francis Hooper, hon. treasurer, who was retiring from the editorship of "A.A. Notes," Mr. Dawber expressed the satisfaction which all felt that their burden of debt was being rapidly cleared away, so that in a short time the Association might look forward to being free from any pecuniary liabilities. The total cost in connection with the new premises had been £10,240.

The Donor of the £1,000.

A generous friend had made an offer of £1,000, provided their debt was cleared off by the end of last session, and although it was found impossible to do that, he was able to announce at their annual dinner in May that this conditional offer had been converted into a gift, and it gave him further pleasure to state now that they had received this £1,000 and that their generous friend was Mrs. Arthur Cates.

In addition to this, since last October they had had promised and actually collected no less than £1,962, including a grant of £527 from their general fund, reducing their indebtedness at the present time to the comparatively small amount of £1,019; and no one would be more gratified with this than Mr. W. Howard Seth-Smith, to whose initiative the scheme was very largely due.

The president then proceeded to refer to the deaths of members during the past year, mentioning Mr. Thomas Blashill and Mr. John Norton, who, with Mr. C. B. Arding (their oldest member) and Mr. C. Forster Hayward, had belonged to the Association for upwards of half a century; Mr. Alfred Waterhouse, who had been a member since 1866; Mr. John Leaning, their former lecturer on quantity surveying; Mr. J. K. Collings, once hon. secretary of the Association; Mr. W. Aston Jones, who was one of the assistant masters in the day school; and Mr. Francis W. Bedford, whose untimely end they all regretted. But, although this was a sad record, on the other hand they had much that was pleasurable to dwell upon, first and foremost being the honour bestowed on their past-president, Sir Aston Webb, R.A.; while Mr. John Murray, one of their vice-presidents, had been appointed Surveyor to the Crown: indeed, it would not be an exaggeration to say that with few exceptions nearly all of those who were doing good and thoughtful work were either members of the Architectural Association or had been in the past.

The Success of the Day School

under Mr. Maule and his assistants had been phenomenal. The opportunity students had of obtaining a grounding in the rudiments of their work—a direction in the right path of learning—was of incalculable benefit, and it would be a great advantage to those whose future lives were cast in the provinces if they also could reap the benefit of these

classes and undergo a systematic training before returning to take up their labours in the country.

The Board of Architectural Education within the last few months had formulated a syllabus and report upon architectural training, which doubtless would be adopted by all the recognized institutions throughout the country; and this the president said he regarded as by far the most important step towards the advancement of architectural education that had ever been taken.

The Association had readily acquiesced in the recommendations of the board, whose syllabus, agreeing very nearly with that followed in the day school, had been adopted, so that the Association's own system of training now co-ordinated very closely with others, yet maintained absolutely its individuality as a school, which was the primary object of the Association.

Exemption from the R.I.B.A. Examinations.

The council of the Royal Institute of British Architects had resolved that the drawings done by students in the day school during the first and second years might be submitted by candidates for the intermediate examination instead of the usual testimonies of study, and eventually they hoped that students who had completed the four years' course in the day and evening schools might be exempted from passing the intermediate examination, on the same lines as at Liverpool and elsewhere.

ANDOVER HOUSE, CROYDON, ABOUT TO BE DEMOLISHED.

This delightful old red-brick house is on the east side of South End, Croydon. Its demolition is to be regretted. The porch has some fine marble columns, and the interior possesses two or three beautifully-carved chimneypieces of early eighteenth-century date. The above sketch is by Mr. Walter H. Godfrey, of London, S.W.

Evening Classes.

Last session the Association had established an evening continuation school, under the mastership of Mr. T. Frank Green, for the purpose of enabling more of those students who had passed through the two-years' course and had entered offices to carry on their work without intermission. The experiment was thoroughly successful, though naturally the numbers were limited. This session they expected to do much better, and to make this course, which was so indispensable an adjunct to office training, one of the most important. The studio work—the real foundation work of the Association—had also done well under Mr. Lewis, but several of the other classes had not met with the support they should, notably the modelling class under Mr. Pomeroy; this was to be regretted in view of the fact that the study of the use of ornament was so essential for students. Some day he hoped the Association might be able to establish a class for drawing and modelling from the life, which was an invaluable aid to learning proportion.

It was matter for regret that only one competitor came forward for the Association Travelling Studentship, as this made it dull both for the Association and the student. This was such an admirable prize, and the work that had to be done was evidence of such all-round knowledge and efficiency, that he trusted in future it would be better competed for.

The whole teaching of the Association was becoming so widely known that it was already a recognized practice for students from New Zealand, Australia and the other Colonies who came over to this country to become members in order to further their education.

The Old and the New Association.

On the other hand, it had not been possible to do all these things without some few detractors, and there were critics who decried the work and said that the Association had no right to launch out into these large educational schemes, urging that the old feeling of comradeship was being swamped under the new *régime*. In reply to that criticism Mr. Dawber said that when the Association numbered a few hundreds unquestionably the idea of mutual help and teaching carried on by its own members was admirable, and worked well, fostering a sense of good fellowship which to some degree might be absent to-day. But every other profession was pushing forward on the road of knowledge and giving greater educational facilities for its students, and therefore it was not a time for architecture, which had so lagged behind in the past, to stand still and see other institutions outrival it in the field of education. With a membership nearing 2,000 the Association had to face the altered condition of things, and if it meant to hold its own as an architectural training-ground the establishment of a systematic and definite curriculum as now taught in their schools and in the studio appeared only the natural outcome and development of the original classes. Yet the danger to guard against in all education was in making the training stereotyped and cut-and-dried, and as a

THE LIVERPOOL MEMORIAL TO MEN OF THE KING'S OWN REGIMENT.
W. GOSCOMBE JOHN, A.R.A., SCULPTOR.

(For particulars see next page.)

consequence turning out large bodies of students whose ideas and methods were formulated into one set channel and whose after-work was bound therefore to suffer from a cramped and too academic training. It could not be sufficiently understood that the scheme of education established by the Association formed only the basis and foundation upon which the student himself must build up the superstructure of his own career and individuality. It would be a mistake if, in making a student's work plain and easy for him and in giving him all these advantages, people should imagine he had only to go through the courses and that then his architectural training was complete. Such an idea would be most unfortunate and entirely at variance with the aims of the Association.

The Artistic Temperament and the Business Instinct.

Mr. Dawber went on to speak of the qualities necessary to make an architect, qualities generally considered impossible to find together in one individual, namely, the artistic and sensitive temperament of the artist with the orderly and common-sense methods of the man of business. Indeed, architecture was to a certain extent more capable of being judged by common-sense methods than any other art, which was doubtless the reason why common-sense people of other professions often thought they would make better architects than those they employed! The general public were more apt to regard architecture as a business than an art—partly because it was ruled more or less by common-sense principles and partly because the accepted method of payment was more business-like than artistic, though a time might come when this would be changed for a scale of charges more in accordance with a man's standing and reputation in his profession.

Mr. Dawber urged students to learn all they could about the routine and working of everyday business, to find out all they could about specifications and materials and everything that pertained to the practical

side of their work, and said it would be an admirable thing for a student to get on a building for some months under a capable clerk of works and see the work carried on from day to day.

The Cheap Cottages.

Referring to the Cheap Cottages Exhibition at Letchworth, Mr. Dawber said it did not seem to have been entirely successful, and it was open to question if much real progress had been made towards a solution of the problem, but architects would do well to pay a visit to the exhibition and study the cottages from a practical point of view.

The main idea and principle governing all good design, both in plan and elevation, was suitability for its purpose, but at Letchworth too frequently no enquiry seemed to have been made by the designers as to the mode of life and the requirements of the people for whom these cottages were primarily intended. Only an intimate experience of the working classes, their needs and habits and casts of mind, could enable any architect to cater for them rationally and well; indeed, without a thorough acquaintance with the requirements of one's clients it was difficult for an architect to produce a satisfactory building. But in other ways the exhibition was instructive and interesting, as showing that, after all, the cheapest and best buildings could be erected in brick and tile and of the natural materials of the country, and also as evidence of an endeavour on the part of architects to deal with the multiplicity of newer and cheaper materials in an artistic yet sensible manner; and though many of these did not lend themselves at present to a very sympathetic treatment, much had been attained in that direction. In using new materials an architect had to be more circumspect than his predecessors, and he had to discriminate in their use, as in adopting any of them he assumed responsibility for their good qualities.

The Public.

In conclusion the president dealt with the position of the public in regard to architecture. He said that when it was realized that the street was the architect's picture gallery, and that when he erected a building in a public thoroughfare, country road, or wherever his commission might lie, his work was on exhibition, not for a few months but for years to come, then the architect would recognize the responsibility of his task, and the public, if their attention were drawn to its good or bad qualities, would soon begin to take an interest in and criticize the work. Not that they did not criticize, and freely too. This, perhaps, to thoughtful men was the most disheartening and unsatisfactory part about it; for people who would be dumb before a picture or piece of sculpture let loose with the assurance of absolute ignorance the invective of their opinion on architecture, quite regardless of whether they were right or wrong. Indeed, the standard of taste in this country with regard to architecture was such that often a really fine and dignified work passed unnoticed or merely excited ridicule because it was unusual and not in accordance with the popular taste. The lack of appreciation was due not to apathy or indifference but simply to want of knowledge.

On the Continent it was the custom for an architect to sign the buildings which he had designed and erected, and Mr. Dawber expressed the opinion that if this were done in England it would tend to make architects more careful of what they produced, as they would then have to stand or fall by their works. This would naturally be unnecessary in every instance, but if an architect felt he had produced a building worthy of his art there was no reason why it should be considered in any way derogatory to his calling for him to sign his work any more than in the case of the painter or sculptor.

If this were done generally it would possibly tend to raise the quality of their work and would in time arouse the interest of the public. But if we wished to produce architecture worthy of admiration it was essential that we should educate and train ourselves and spare neither time nor energy in the study of our art.

A vote of thanks was proposed by Mr. Leonard Stokes, seconded by Mr. John Murray and supported by Mr. Louis Ambler and Mr. E. T. Hall. The president replied, and in conclusion announced that the next meeting would be on October 20th, when Mr. Andrew Oliver would read a paper on "The Ecclesiastical Architecture of the City of London," illustrated by lantern views.

Enquiries Answered.

Girder Work.

LONDON, S.E.—STUDENT writes: "Which is the best way to carry two plate girders—20ins. deep by 16ins. wide—(carrying 18ins. walls) over a cast-iron column at the corner of a building?"

For a single-web plate girder the best connection to a cast-iron column is shown in Fig. 1, the lower flange and the web being bolted to the column. The condition of loading is shown in Fig. 2, and the calculation of stresses is given below:—

D = outside diameter of cast-iron column in inches.

d = inside diameter of cast-iron column in inches.

I^0 = moment of inertia of same about an axis through centre of gravity, in inches⁴.

e = eccentric displacement of the load in inches.

P_1 = the load in lbs. on one bracket.

P_2 = the load in lbs. on the other bracket.

s = extreme fibre stress in lbs. per square inch.

A = area of cross-section of the cast-iron column.

FIG. 1.

FIG. 2.

Assuming the load is placed midway on bracket, which is 4ins. wide, e is equal to $\frac{D}{2} + 2$. The bending moment created by $P_1 = P_1 \times e$ and by $P_2 = P_2 \times e$. The fibre stress due to direct compression is $\frac{P_1 + P_2}{A} = s_1$

and due to bending $\frac{(P_1 + P_2) \times e \times D}{2 \times I_0} = s_2$.

The total fibre stress in the extreme fibre s is the sum of s_1 and s_2 , and should not exceed the safe working stress for cast-iron columns with certain relation between length and radius of gyration. S. V.

Strixton Church, Notts.

WELLINGBOROUGH.—C. O. G. writes: "Is there anything worth measuring in Strixton Church, Northampton, for the R.I.B.A. intermediate examination?"

Strixton church is one of the most suitable churches for the modern architect to study, on account of its simplicity and the exquisite proportions of its parts. There is scarcely a feature in the whole church which would make a full sheet of measured drawings, unless it be either the double piscina or the rood screen. Perhaps the best way to produce a suitable testimony of study would be to measure one whole elevation, preferably the east or west end. H. Y. M.

Architects as Arbitrators.

DOUBTFUL writes: "In a case where the two partners of a firm of architects are stipulated in the contract as sole arbitrators between client and builders, is it legal for either partner to witness the signing of agreement or must some other person be called in for this purpose?"

It is quite legal, but it might turn out to be undesirable, inasmuch as if any dispute arose as to the authenticity of the agreement it would be necessary for the arbitrators to be witnesses at the arbitration held by themselves! A building agreement does not require to be attested to be valid. Therefore the attestation clause is surplusage. If such an agreement has to be attested, and it was attested by the arbitrator appointed in it, in no case would the agreement be illegal, although possibly it might conceivably operate so as to make the appointment of the arbitrator void in certain rare cases.

S. P. J. M.

A LIVERPOOL MEMORIAL.

THE Liverpool Memorial to men of the King's Own Regiment, illustrated on the preceding page, was unveiled by Sir George White on September 9th, and is the work of Mr. W. Goscombe John, A.R.A. Upon the central pedestal stands a figure of Britannia in the attitude of blessing. At either corner of the curved parapet are soldiers, one of 1685 (in which year the regiment was enrolled) and one of 1902. In front of the pedestal are regimental trophies, and at the back is a drummer boy of the time of the battle of Dettingen. The names of all the men who fell in battle or died of wounds or disease are carved in the face of the parapet. The very fine bronze was cast by Mr. A. B. Burton, of Thames Ditton. The pedestal is of finest grey granite and is the work of Messrs. Kirkpatrick Brothers, of the Manchester Granite Works, Trafford Park. It covers a ground space 21ft. square and is 14ft. high, or to the top of the figure 22ft. high. In its construction about 120 tons of granite have been used, the centre block having been cut from a block containing 15 tons; and more than 5,000 letters have been cut in the stone. The memorial occupies an excellent position in St. John's Gardens and has received very high commendation.

ARCHITECTURAL SCULPTURE.

An Important Invention.

A REMARKABLE machine has recently been constructed at the works of the Sculpture Syndicate, Ltd., 62 and 64, Sumner Street, Southwark. This machine (of which a specially taken photograph is here given) will reproduce models of statues up to 10ft. in height, 5ft. 6ins. in diameter and 20 tons in weight. It is by far the largest in existence and seems capable of doing the biggest work that could reasonably be required. Statues seldom, if ever, exceed 10ft. in height in one piece; if required larger they can, of course, be

The machine has been designed by the general manager of the syndicate, Mr. Gaze. It will be seen that the model is placed on one revolving table and a block of stone on the other. The pointer and cutter are on a travelling carriage at the back. The method of working is to run the pointer over the model, which latter is turned round gradually. The block of wood on the pointer is for the purpose of keeping the point some distance away from the model during the first rough cutting with a large and powerful drill. The cutting drill travels at a great speed. Each table is on ball bearings and will sustain 20 tons weight. These circular tables not only turn round horizontally, but at the same time can be raised or lowered vertically;

be cut in stone with great ease. Thus the machine has many possibilities in the way of doing intricate stone detail, apart from statues and carving. The machine is also economical for pointing the stone for sculptors to work in the ordinary way.

The finer finish on a statue is done simultaneously from the front by the overhanging trapeze arrangement shown in our view. This is so precise that the stone is left in the exact state required by the sculptor for finishing. It should be clearly understood, however, that the work done by the machine in no way affects the artistic quality of the sculpture. The machine simply does the work which in the ordinary way would be performed by the sculptor's assist-

THE NEW AUTOMATIC SCULPTURE AND STONE-WORKING MACHINE.

worked in portions on this machine to any size.

The original machine which the company used, and still uses, was invented by an Italian sculptor, Signor Bontempi, but it can only take figures up to the size of about 3ft. The present machine is a very great advance on the former one, and is entirely different in construction, except for the hydraulic valves that operate the drills—these valves constituting the chief feature in Signor Bontempi's patent and ranking it superior to other automatic sculpture machines. The valves are so delicate that the slightest pressure will move the machine, whereas other machines need special models cast in iron to avoid the original being damaged by great pressure on the indicating point.

in fact, the whole machine is a colossal vertical lathe with travelling cutter.

The possibilities of the machine for architectural work are great, because it will be seen that by placing a block of stone on the table it can be turned not only into a column, but by lowering the table and at the same time turning this round spirals can be worked, and the reversing arrangement on the machine enables spirals to be cut parallel, both coming down and going up, thus saving time. The whole contrivance is quickly lowered and raised, so that it can be advantageously used for fluting columns, and it will do what an ordinary lathe will not do, namely, put a square cap on a column. In fact, by the use of ordinary templates almost any geometrical form can

ant, the work being in every case finished by the sculptor in the usual way. It is noteworthy in this connection that the Sculpture Syndicate make a special point of the artistic side of their work, and we understand they have secured the services of Mr. Courtenay Pollock, R.B.A., to personally supervise their sculpture.

The power of the machine may be judged from the fact that it will make a 3in. cut 4ins. deep in Corsham stone. The saving in cost by this machine is apparent when we see that statues so roughed out can be executed at about one-third the cost they would be by hand.

The firm have a number of other remarkable machines for woodwork, one of which makes forty thousand cuts per minute.

MR. PERKINS PICK ON THE DECLINE OF HANDICRAFT.

AT last week's opening sessional meeting of the Leicester Literary and Philosophical Society Mr. S. Perkins Pick, F.R.I.B.A., delivered his presidential address, taking for his theme the decline of artistic handicraft. It was generally admitted, he said, that the masonry of mediæval times exhibited greater excellence in workmanship, combined with suitability in design, than that done to-day. It was to be remembered, however, that the social, political and industrial conditions of those times differed entirely from those of the present. There was no contracting in the modern meaning of the term, and there was no competitive system by which the individual was encouraged to shape his policy to suit his own ends and to disregard his duty to others. Members of the craft were banded together for the common good in their trade guilds. Craftsmen were then of some importance, and had complete control of the various matters connected with their trade. It was an age of small employers, every one of whom was compelled to belong to the guild before he was allowed to work. Rules were stringent with regard to proficiency and training. For example, quoting from a warrant of an old masons' guild, "If incompetence is proved against any mason, he is fined by the guild; a second conviction is followed by a second fine; and a third by expulsion from the guild and the fore-swearing of the craft for ever."

Apprenticeship.

In those times no one was allowed to enter the craft except through a seven years' apprenticeship. The number of those who entered was strictly limited, and every master was in duty bound to give personal instruction to his apprentices. The chief object of

the guild conditions seemed to have been to ensure that only the best class of work should be done. The methods adopted, as no one who had studied their beautiful mediæval buildings would deny, produced a body of craftsmen who were incomparably superior to the present-day workman, and whose like they would probably never see again. The mediæval apprenticeship customs prevailed in all handicrafts from early days to the end of the eighteenth century, when manufacturing, with its specializing in departments, generally destroyed that unity which was such a valuable outcome of the old-fashioned methods. With the Victorian era there came in a so-called freedom of treatment which offered encouragement to a variety of shams. He used the expression "Victorian era" because it was a convenient one, and not with the intention of implying that we in this country were alone to blame. As a matter of fact, what occurred in England was also experienced throughout all the more civilized countries of Europe.

The Machine and Art.

Referring to this question, Mr. Pick said that in all probability it was impossible to give that human interest to machine-made articles which the old handicraft goods possessed, but there was not a doubt that men of good taste could enormously improve upon the work generally produced if their services were requisitioned by those who had the power to direct the process of manufacture, for machine-made articles were not necessarily ugly. It was a most regrettable sign of our times that very few manufacturers or tradesmen tried to make the best and most suitable articles to satisfy their own judgment, but rather aimed at pleasing the public taste, which had become debased by the contemplation of the ugliness which abounded on every side.

Commenting upon the appearance of modern streets in Leicester and the "improvement" to the High Street as rebuilt, he said that the corporation made it a condition that the sale of the land was subject to the architecture of the street elevation being approved. The result showed how difficult it was to carry out the condition with any degree of success. It might not unreasonably be said that this was the fault of architects, and therefore there was no occasion to accuse the public of want of judgment or the corporation of lack of taste. Doubtless to some extent that was true, but was not the real cause more deeply seated, namely, that the public demanded the impossible from the architect and the builder? The business man knew full well that, without the glaring lamps, the shouting advertisements and the large plate-glass windows, he would have but small chances of attracting purchasers, and yet they would readily admit that these commercial necessities were the foundation of the ugliness which prevailed in their business thoroughfares.

Finally, he said that a cemetery of to-day was representative of the general taste of the age, exhibiting how commercialism had invaded even our last resting-places.

The "Auld Brig of Ayr": Engineers favour Repair rather than Rebuilding.—The opinion of the engineer who made a report on this bridge on behalf of the Society for the Protection of Ancient Buildings is favourable to the retention and repair of the existing bridge, and this opinion is supported by reports sent in by other engineers. As the scheme of repair will cost considerably less than the erection of a new bridge, it seems impossible that the town council can come to any other decision than to retain Burns's bridge.

THE ARCHITECTURAL STUDENT'S NIGHTMARE (THE RESULT OF AN OVERDOSE OF EXAMINATION).

Law Cases.

Workmen's Compensation : Another Case.

—A workmen's compensation case against Messrs. Spencer, Santo & Co., Ltd., was heard last week at Southwark. The claim was made by the widow of a workman named Smith for £300 damages for the loss of her husband. Smith was a ganger in charge of a mortar crusher at the Union Jack Club, Waterloo Road (in course of erection), and while watching the machine at work the belt slipped off and he was caught and killed by it. Counsel for the respondents said that a specific order had been given to Smith and the other men "not to meddle with the machinery," and in going round from a place of safety to within reach of the flying belt Smith was "meddling with the machinery." Therefore he had been guilty of "serious and wilful misconduct" within the meaning of the Act, and the claim for compensation could not be sustained. His Honour: If that is your idea of serious and wilful misconduct, you had better drop it at once. He would have been less than an intelligent being if he had not gone round. It is not in human nature for a man who is in charge of machinery to see an accident and not to go up and see what is the matter. There is no evidence whatever of the man's meddling with the machinery.—An award was made in favour of the widow for £240 and costs.

Competitions.

A School at Derby is proposed to be erected between Clarence and Porter Roads. In a recent competition for designs Messrs Hunter & Woodhouse, of Belper and Derby, were awarded the first premium of £50, and Mr. T. H. Thorpe, of Derby, was awarded the second premium of £20.

Epsom Church.—Seven architects were recently invited to submit designs for the rebuilding of the parish church at Epsom. These were Messrs. Banister, of Epsom, A. Bidlake, C. H. Mileham, J. Hatchard Smith, Charles Spooner, Temple Moore and Sir Charles A. Nicholson & H. C. Corlette. Mr. G. H. Fellowes Prynn, the assessor, has selected the design by Messrs. Nicholson & Corlette.

A Newcastle School Competition.—Mr. Arnold Mitchell, F.R.I.B.A., the assessor in the competition for designs of schools at Bolam Street, Byker, Newcastle-on-Tyne, has awarded the first place (entailing the commission to carry out the work) to Mr. W. H. Knowles, F.R.I.B.A. of Newcastle; the second place, with premium of £30, to another set of designs by the same architect; and the third place, with premium of £20, to Messrs. Marshall & Tweedy, of Newcastle.

Hove Public Library Competition.—The assessor in this competition, Mr. John Pelcher, F.R.I.B.A., has reported to the Corporation of Hove that as "the authors have all either not complied with the conditions or the designs are otherwise defective" he is unable to make any award or advise the Corporation to accept any of them. In the case of designs which do not comply with the conditions of the competition, it may be correct to withhold the premiums, but in those "otherwise defective" we think the pledges of the Council should be carried out, and we shall be glad to learn that the assessor and the Corporation have decided upon whom to award the premiums. A definite promise was also made as to the public exhibition of the designs, and when this is fulfilled competitors and public will be able to judge whether the designs are all so inadequate as to preclude the possibility of slight modifications making them serviceable.

BELGIAN CEMENT.

Fraudulent Practice of Selling it as English "Portland."

IN his report on the trade of Belgium for the year 1904, just issued by the Foreign Office, Mr. Consul-General Hertslet makes some interesting remarks about the cement trade. He says that although the exports of minerals from Belgium increased considerably in 1904—and the mineral trade is principally composed of cement—the exports of home-manufactured cement declined from 599,091 tons in 1903 to 588,295 tons in 1904, the respective values for the two years being £623,040 and £564,762. The exports to this country show an increase of 116 per cent. in volume and of 26 in value, the figures for 1904 being 231,213 tons, of a value of £221,964. This far exceeds the exports to any other country, as it comprises more than one-third of the total.

From the above figures it would appear that the average value of exported cement is somewhat below £1 per ton. Prices during 1904 continued to be very low and the profit to manufacturers was but small. Orders for "Portland cement" of Belgian manufacture were unremunerative, but during the present year they have been gradually improving, owing to an understanding which has been arrived at between the German and Belgian manufacturers. A syndicate was recently formed between the manufacturers of Belgium, Germany and the Netherlands, which is to remain in force for nine years from January 1st last. This combination of manufacturers appears to have had a very favourable effect on the price of cement in Belgium, which has been very low for a number of years, but which now shows every sign of a steady increase.

While referring in particular to Belgian "Portland cement," the Consul-General observes that it may be useful to call attention to the practice of manufacturers in Belgium of describing their cement as Portland cement. "This practice of conspicuously marking cement of Belgian origin with British trade descriptions is carried out in great detail, and many trade-marks of Belgian cement, printed in English, have come under my own notice in connection with the export of cement from Belgium to South Africa and to other countries, including the United Kingdom. Such marks as 'Castle Brand,' with the words 'Special Quality, trade-mark,' are of common occurrence, and practically all large quantities of cement are labelled in plain characters in the English language, with the obvious result of leading purchasers to believe that the goods they are buying have some British connection. There is no doubt that the object of Belgian manufacturers in marking their cement in this way is to imitate the labels of British barrels, and thus to dispose of a quality inferior to the Portland cement made in the United Kingdom as a substitute for genuine British-manufactured Portland cement, at a reduction of a few shillings on the English prices. It is true that the barrels or bags of cement are invariably marked 'Made in Belgium,' but this, in addition to freely advertizing the cement of Belgium, does not warrant the use of the English language in describing goods manufactured in Belgium, especially in view of the fact that the English descriptions and trade-marks are far more conspicuous than the inscription 'Made in Belgium' placed on the barrels."

A Protest.

In connection with this fraudulent practice the secretary of the Associated Portland Cement Manufacturers (1900), Ltd., writes to us as follows: "Unfortunately, the Consul-General is in error in stating that such packages are invariably marked 'Made in Belgium,' for much of the Belgian cement

imported into the United Kingdom comes in sacks bearing in English the inscription 'Portland Cement' or even 'Best Portland Cement' without any indication of its Belgian origin. Hitherto the Customs authorities have declined to insist upon the words 'Made in Belgium' unless the packages also bear the full name or full initials of the English importer; they refuse to recognize that a single initial, even when accompanied by the English descriptive words I have referred to, requires any such qualification. That the foreigner, anxious to sell his inferior article and recognizing the improbability of success when its true origin and character are known, is not slow to avail himself of this loophole is obvious from a letter which now lies before me. Addressed to a firm whose name begins with 'G,' it volunteers the advice that the sacks could be marked 'Portland cement' on one side, and 'G' on the other, without the necessity of adding the words 'Made in Belgium.' If the commissioners are correct in their interpretation of the Merchandise Marks Act, is it not time their hands were strengthened? Meanwhile, the consumer, lulled into a false sense of security by the belief that all foreign goods must be marked with the country of origin, can and should protect himself from fraud by insisting upon being supplied only with packages bearing the full name and address of a well-known British firm."

Cement outside the Combine.

At last week's meeting of Messrs. Martin, Earle & Co., cement manufacturers, who remained outside the combine formed five years ago, Mr. Vavasour Earle, the chairman, said that the profits available for distribution were equivalent to 7½ per cent on the ordinary capital, but the directors had concluded that the shareholders would be more satisfied with 5 per cent., leaving the remaining profits to be carried forward. They expected presently to establish a reserve fund for equalization of dividends. The selling prices last year were 2s. to 3s. per ton less than the average of the first five years, and every additional 6d. per ton was equivalent to 2½ per cent. for increased dividend or reserve. Their advantageous position was partly due to the fact that they were now no longer paying any dividends on unproductive capital. Moreover, they supplied their own raw materials, which they thus obtained at bedrock prices. Their rotary plant had marked advantages when high prices were ruling in the coke market. The company was one that could afford to wait with patience for better times in the trade.

The Need for Protection.

Messrs. Johnson & Co., of Gateshead and Greenhithe, writes as follows: "As regards the continued slump in the price of cement in this country, it is getting to a very acute stage indeed, and has now reached that point when any small profit for the home manufacturer begins to vanish, and it will then be a case of gradual extinction for that home industry, commencing with the weakest, unless something is done, and that very quickly, to prevent the dumping of French, German and Belgian cement on these shores. There is no need to go into the reason for this state of things, as it is well known to all who have studied the matter that the cement is made at a much lower cost in these countries than here, and being protected they get a higher price from their own consumers and so are able to make a good average, although selling at a much lower price here. Much of it is natural cement and does not go through the same process as English, and is inferior in that respect; still, there is a market for it amongst a certain class of buyers, and that, combined with the heavy import of better kinds, helps to draw away orders from our own makers, and consequently we must try to

meet this unfair competition by reducing the price. Either that or we must see our orders going past us, and consequently be compelled to shut down the greater part of our cement kilns and pay off large numbers of our workpeople. . . . It is very hard to see an industry that had its origin in this country being surely done to death by these foreigners, who will not allow an ounce of our cement into their countries. Protection is needed without delay."

GARDEN CITY AND THE LAY CRITIC.

A BREEZY criticism of the cheap cottages exhibition at Letchworth appeared recently from the pen of "Wide-Awake" in the "Liverpool Echo," from which we extract the following, taking occasion, however, to remark that the opinions are hardly those of an expert, but interesting nevertheless as a flippant addition to the various other criticisms which have found their way into print:—

"I have had a peep, gentle reader, at Garden City. Perhaps you envy me, but you needn't. The name Garden City represents a great and lovely idea—one of the distinctive ideas of the twentieth century. At present it also represents one of the most desolate regions in these islands—a very desert of mud and bricks and wooden shanties, in the wind-swept uplands of far-away Hertfordshire. It takes you a whole day to get there* and goodness knows how long to get back, and for your trouble you get a feeling that you wish you had spent your time around a brickfield nearer home. . . . Ten years hence there may be something at Letchworth worth seeing, and by that time it may be possible to travel two

* "Wide-Awake" writes from Liverpool. From London it is possible to get to Letchworth in 55 minutes. "Wide-Awake" might have added that it takes eight days to get there from New York.

or three hundred miles without having to worry lest your family are starving at home in your absence. Garden City, indeed! Looks at present more like a series of hen scratchings and a few advertising spaces for jerry-builders. Oh, those builders and architects and artists! Nearly every cottage looks as though something had happened to it. . . . Many of them go—or soon will be going—on crutches, some have had a mighty

bash in somewhere or other before the baking; others resemble nothing on earth as much as a kick in a mud wall. Some roofs are very handy for sitting on, others for tobogganing, and many for providing the inmates with an inexpensive shower bath. Brodie's concrete Roman villa is hard to beat for external ugliness even at Letchworth. . . . Garden City, you see, has started well by being humorous.

All the Moonstruck Architectural Ideas of the Island

have been let loose there. If I were judge I would award the biscuit and a concrete medal to the genius who designed the circular spider's-web sort of mansion,* with twenty-five doors, sixteen windows, one chimney in the middle, and no upstairs. I tried about a dozen doors, but failed to get in. One door opened into the coalplace, another into the scullery, another into the bathroom, another into the larder, and so on. Then I gave it up.

"The idea of the exhibition, I was told, was to show how a six-roomed cottage could be built for £150. And the way it was done was to build houses costing twice the money—some of them perhaps worth the expense, and others honestly worth about a third of it, if dropped down in some habitable place. . . . The architects should try again."

* Messrs. Cubitt's concrete cottage, designed by Messrs. Hesketh & Stokes.

HOSE TOWER.

L.C.C. FIRE-BRIGADE STATION, OLD KENT ROAD: BILLIARD-ROOM. W. E. RILEY, F.R.I.B.A. SUPERINTENDING ARCHITECT.

LONDON COUNTY COUNCIL FIRE-BRIGADE STATION, OLD KENT ROAD

S.E. W. E. RILEY, F.R.I.B.A., SUPERINTENDING ARCHITECT.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

OUR PLATES.

THE London County Council fire-brigade station illustrated in this issue occupies a corner site abutting for a length of 58ft. 6ins. on Old Kent Road and 102ft. on St. Thomas's Road. The accommodation is for a full station, and is contained on five storeys. On the ground floor space is provided for a horsed-escape and steamer, with stabling adjoining for four horses. The two stalls for horses on duty open direct into the engine-room, and swinging harness is provided over the appliances. The ground floor also contains the watch-room, recreation-room (for full-size billiard table), small reading-room, laundry and stores. The upper floors are planned to accommodate eleven married and five single men, including the station officer. The quarters are all self-contained, and have separate sculleries and w.c.'s. Bathrooms are provided on each landing. The elevations are of red brick and Portland stone, and the roof is slated. A series of sliding poles is provided to land the firemen from all the floors to the engine-room, the doors to these poles being operated from the watch-room by an electric switch. The building has been carried out from the designs of Mr. W. E. Riley, F.R.I.B.A., the Council's superintending architect, and was erected by the Works Department in 1904.

Correspondence.

The Estimating Clerk.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I was glad to see your leader on "The Estimating Clerk." As you so frankly and courageously point out, the building trade is being ruined by the present system of competing for work by tendering at such a price that it is impossible to make the work pay if honestly carried out. Coming as I do in close contact with a large number of men connected in various ways with the building trade, I can assure you there is no point on which they are more in agreement than on the value of the building trades as an employment. The mechanics grumble because they are not allowed to do the work in a manner worthy of their craft whenever slipshod methods can be used to save some of the legitimate cost of labour. Foremen grumble because they are expected to carry the works through so as to produce a profit when the estimating has been done on a ridiculous basis, and because they have to scheme to make the job pay by using inferior work and materials, and by adding extras whenever there is the slightest chance.

To state some of the instances in which work has been deliberately shirked and very inferior materials have been substituted for those costing much more would be to render oneself liable to libel; but unfortunately such a proceeding is not necessary, as any reader can no doubt supply instances for himself.

Perhaps the worst cases of all are those in which the extras, whenever they cannot be closely checked, are entered as consisting of a much larger amount of labour and materials than is actually the case. Of course, this is nothing less than downright robbery, yet it is done by builders in a large way.

Perhaps to an outsider the strangest part of this question would be the fact that an architect and often a clerk of works as well are employed to see that the work is properly executed, and that the materials are those specified. An elaborate specification is drawn up at considerable expense to state exactly the materials that should be used in the construction, and the specification, together with the drawings, also defines in a great many instances the actual details of construction to be used. To see that these are properly complied with, a clerk of works is employed at considerable expense, and, in addition, the architect gives at least a portion of his time to the consideration of these details.

Now, it seems to me that these gentlemen are either ignorant of their duties or else they wilfully neglect to serve their employer, as honest men should, whenever shoddy materials and inferior workmanship are allowed to replace the quality specified.

If builders were to be rigidly kept to carefully worded specifications on every occasion when an architect or clerk of works was employed, I fancy we should hear a little less of undercutting prices being employed to obtain work. It is certain that no man could afford to lose on every job he did, as he would have to if he estimated below cost price—with the hope of making some profit by subterfuges—and were kept up to his contract.

Again, the present system of taking the lowest tenders in the majority of cases is one that tends to make matters worse, as those who can cut the most are those who thereby obtain the largest amount of work. If building committees and others having the placing of contracts would investigate the extras on works carried out by those who tendered they would often find it pay to accept a tender much higher in the list. The total cost would be lower and the quality of the work better.

As you have pointed out, the present system of estimating is suicidal, and it also has the effect of demoralizing all who have to help to produce a profit under such conditions. Can it be expected that men will do their utmost when at every chance they are told to scamp the work to save a little? No wonder the old pride of craftsmanship is dying out; how it could grow under such conditions one does not know.

While agreeing with your proposals as to the position of the estimating clerk on large works, it would appear that those who supervise the erection of buildings in the interests of the owner have a good deal of power to stop some of the practices of the builder who presents an unreasonably low tender.

When disputes arise in many instances the builder bluffs those responsible for the proper execution of the work by threatening to take the matter to law, and thus often gets the affair adjusted to his advantage. With carefully worded specifications this practice should not hold, as the builder would have no case.

It is time that the honest men connected with the building trade endeavoured to rid it of these dishonest practices, and on the behalf of such allow me to thank you for your leader.—Yours truly,

LONDON.

R. E. M.

Obituary.

Mr. John Melvin, architect, of Alloa, died recently.

Mr. R. Fulton.—An inquest was held at Rugby last week on the body of Mr. Robert Fulton, aged 72, a builder of Brockley, Kent, who was found dead in a second-class compartment of a train from Scotland recently. Dr. Simpson stated that the cause of death was syncope following exertion, and the jury returned a verdict to this effect.

The late Mr. G. E. Lowry, of Messrs. J. & W. Lowry, contractors and quarry-owners, Jesmond, left estate which has been valued at £20,938.

Mr. T. W. McLaren, partner in the firm of McLaren & Co., builders and quarry-owners, was fatally injured recently by a fall of stone while superintending the building of a sewage tank at Low Mickley, near Prudhoe, in connection with the sewage scheme of the Hexham Rural Council. He was only 30 years of age.

Builders' Notes.

Glass Bricks.—No. 295 of the United States monthly consular reports contains reports from American consuls in Europe with regard to the manufacture and use of paving bricks from glass. The best reports are from Havre, Lyons, Berlin, Dresden and Barcelona.

Bristol Association of Clerks of Works and Builders' Foremen.—At a special meeting of this Association held on Thursday evening last, Mr. George Crispin (of the firm of Messrs. James Crispin & Sons, horticultural builders) gave a lecture on heating and hot-water apparatus for buildings, illustrated by blackboard sketches. The lecture awakened much interest and was highly valued.

Rural Building By-laws.—A recently issued return shows that in 246 rural districts in England and Wales—out of a total of 668—there are no by-laws for the regulation of new buildings. In 169 districts and in parts of 114 there are by-laws based on the urban model, in 106 districts and in parts of 32 there are by-laws based on the rural model, and in 11 districts and in parts of 6 the by-laws are not based on the model series but were mostly made before the first issue of the model in 1877.

Keystones.

For a new Cottage Hospital at Abertillery, Mon., Mr. Arthur E. Sheppard, of 39, High Street, Newport, has been appointed architect.

Change of Address.—Prof. F. M. Simpson, F.R.I.B.A., has removed from 137 to 88, Gower Street, W.C. (telephone, 5,737 Central).

Partnership.—Mr. W. H. Seth-Smith has taken into partnership Mr. William Ernest Monro, who has been associated with him in practice for the past fifteen years. The practice will be carried on under the style of Seth-Smith and Monro.

Mr. William Bevan, F.R.I.B.A., has resumed practice at 6, Parliament Chambers, Great Smith Street, Westminster, owing to the abolition of the office of chief architect to the Transvaal Government, which office until quite recently he held.

The Academy Professorships of Sculpture and Architecture.—No successors have yet been appointed to the posts formerly held by Mr. Alfred Gilbert, R.A., and Mr. George Aitchison, R.A., and the Royal Academy has been unable, therefore, to make the usual announcements of winter addresses by its professors of sculpture and architecture.

Frascati's Restaurant, in Oxford Street, has been redecorated in a scheme of blue, white and gold, and the Winter Garden has been enlarged by the addition of a new wing, this being rendered possible by the removal of the kitchen to newly-acquired premises in the neighbourhood. Over the new wing a commodious masonic hall has been built, Mr. Charles H. Worley, F.R.I.B.A., being the architect.

City Streets Lighted by Gas Once More.—Gas lamps with duplex incandescent mantles have now been erected in place of the electric light standards in Queen Victoria Street, Queen Street, Lower Thames Street, Monument Street and Fleet Street. Fleet Street has thirty-four gas lamps, giving an effective light of more than 5,000-c.p. near the pavement level, at a cost of £207 a year, in lieu of twelve arc lamps giving 6,000-c.p. far above the pavement at a cost of £312 a year.

The new County Hall.—Negotiations for the purchase of the properties on the Westminster Bridge Road site for the new county hall of the London County Council are stated to be progressing, and the Establishment Committee hope shortly to be in a position to report definitely on the matter. An article on the proposed building, written by Mr. John Burns and illustrated by some fine sketches by Mr. Hedley Fitton, appears in the current issue of the "Pall Mall Magazine."

300 Mistakes in Drawings.—At last Wednesday's meeting of the Leeds City Council Councillor Armitage, chairman of the Waterworks Committee, said that the new waterworks engineer had found 300 mistakes in twenty-nine contract drawings for the reservoir at Colsterdale. Work had accordingly been stopped. In one case the plans provided for the construction of a bridge which terminated at one end 4ft. above ground level, so that a horse and trap would have to jump that distance on leaving or entering the bridge, while another bridge, to cost £800, was left out of the plans altogether. In another case a proposed embankment would be threatened by a landslip equal to a million cub. yds. of boulder clay. The tunnel which brought the water through the embankment had curves and tangents that were wrong, and the tunnel itself did not meet; the drains would not carry the water away; and for the trench alone there would be an extra of £227,000 on the original estimate of £300,000. One result of these mistakes is that the corporation have had to acquire fifty additional acres from Lord Masham.

THE ELECTRICAL EXHIBITION.

DESPITE the rapid and important growth which has been made in electrical work in this country, thirteen years have elapsed since an exhibition embracing all the various branches of the industry has been held. The exhibition now open at Olympia is therefore of particular interest, more especially as it has been organized under the patronage of the Institution of Electrical Engineers and under the auspices of the National Electrical Manufacturers' Association. The great hall is entirely filled with stands presenting a vast number of interesting exhibits. A great number of them are quite outside our own sphere—such as those relating to dynamo construction, tramways, &c.—but we may opportunely refer to those exhibits with which architects and builders are more or less concerned, either in the fitting-up or electrical decoration of buildings.

Radiators.

At this time of year people are beginning to think of the winter and the necessity for providing suitable heating apparatus. This is a field where electricity is making considerable advance, though it must be admitted that the very merit which is claimed for electric light as one of its advantages over gas—namely, that while giving illumination it does not produce undue heat—necessarily has an opposite application in regard to electric heating, though the method of employing current for such purpose is different to that for lighting. There are two methods of warming by electricity—one by producing heat rays which extend throughout the room and warm all the furniture, &c., which in turn warms the air passing over it, and the other by warming the air direct. Radiators of the former type are to be seen on numerous stands at the exhibition, more particularly on that of the Dowsing Radiant Heat Co., Ltd., of 24, Budge Row, E.C. This firm exhibits a great many varieties, in most of which four long frosted lamps are fitted in front of a copper reflector. This constitutes the standard type of radiator, consuming 1 unit of electricity per hour. At heat rate, current in some places—though unfortunately in very few—can be obtained as low as 1d. per unit, in which case a radiator would cost 1d. per hour full on and ½d. half on. Switches enable the lamps to be turned on and off whenever desired, and as the heat is given

PROMETHEUS ELECTRIC RADIATOR.

out at once these radiators are very convenient for warming offices, bedrooms, &c., while the fact that they also give a cherry light adds to their attractiveness: it is our experience, however, that the globes are rather liable to be broken and are costly to replace. The cost of the radiators themselves ranges from £3 15s. upwards.

The second type of electric heating apparatus is admirably exhibited by the British Prometheus Co., Ltd., of Kingston-on-Thames (London showrooms, 27, Ely Place, E.C.). These radiators consist of a metal body, in front of which are arranged two series of mica slats coated with a metallic film, with two ruby lamps behind, so as to give the whole a reddish cosy appearance when lighted. This is a very effective type of radiator, and it is made by this company in a great number of most attractive varieties. Architects who are in want of something neat and serviceable should take note of this exhibit. The cost of the radiators is practically the same as the other type referred to above, and the current consumption is, we believe, the same. One of the most recent buildings for which they have been adopted is Ingram House, Stockwell, the hotel for city clerks, &c., now being erected from designs by Mr. Arthur T. Bolton.

The General Electric Co. show some wood-cased radiators, of fire-resisting material,

which lend themselves to an infinite variety of decorative treatment at moderate cost, which would be prohibitive if treated in metal on similar lines.

Fire Alarms.

Several varieties of electric fire lamps are to be seen at the exhibition. The Pearson Fire Alarm Co., Ltd., of 62, King William Street, E.C., have an important exhibit showing their system in all its applications. The essential feature of this system is the thermostat, which is a very simple device consisting of a little metal strip firmly fixed at each end. This expands on the application of heat, stretching up and making contact with a pointer above, and thus setting in operation the whole of the bell-ringing system. The thermostat is so constructed that the distance between the pointer and the metal strip can be regulated simply, and thus the alarm can be set to ring at any desired temperature. We ourselves had one of these thermostats set to about 80 degs., and then breathed on it, when almost immediately the gongs and bells on the stand were set ringing. It would occupy too much space to go into all the details of the system, but we may briefly state that it is admirable

THERMOSTAT OF PEARSON FIRE-ALARM.

for factories, workshops, town halls and other large buildings, as it establishes automatic connection between the scene of the fire and the nearest fire-brigade station, so that immediate notice of an outbreak is given; in fact, there have been cases where a fire has broken out, the call has been given to the fire-brigade station, and the firemen have arrived on the scene and actually been the first to acquaint the occupants of the existence of a fire on their premises.

At the stand of the General Electric Co., at 71, Queen Victoria Street, E.C., a number of other fire-detectors, alarms and telephone fire-brigade calls are shown. The exhibit includes several types of thermostats, especially the very neat one illustrated below,

which is operated by the expansion of air in a sealed chamber, causing one side to bulge outwards until contact is made with the set-screw at the top of the thermostat. The cost of this little device is only 5s. Another type consists of a copper wire about 7ft. long, which is fixed near the ceiling of a room and has a carbon contact block suspended from the centre of it. When the temperature rises the wire expands, lengthens and sags, and thus contact between two springs is made by the carbon block.

Messrs. Joseph Kaye & Sons, Ltd., of 93, High Holborn, show "K's Patent Electric Firm-alarm Lock," which enables the person in charge of a building, by pressing a button, to instantly open all the doors fitted with this patent.

Still another type of fire-alarm apparatus is the pyrophone, exhibited by the Pyrophone Co., of 52, Queen Victoria Street, E.C. It consists of a bent glass tube with one branch exposed and the other covered with insulating material. One part detects the sudden outburst of fire, while the other is designed to detect a slow or smouldering fire. This apparatus gives first a danger call, then a fire call, and then a trouble call in the event of any disorder arising in the system; which is

HAULING GEAR OPERATED BY "WITTON" MOTOR.

of the utmost importance, because a fire-detecting apparatus in an inefficient condition is worse than useless.

Electric Photo-copying.

One or two stands at the exhibition deal with the production of copies of drawings by electric light, apparatus being shown to enable this to be done with speed and regularity. Messrs. J. Halden & Co., of 8, Albert Square, Manchester, show a large continuous photo-copying machine. This is made either in single or double form, the machine exhibited being of the latter type. Three arc lamps are arranged in the centre, and the tracing and paper are fed over rollers on either side, so that two different copies can be taken at the same time, while long rolls—even as long as 100 yds.—can be used. The speed at which rapid ferro paper receives the correct exposure is one minute per ft. lineal. Should it be desired to make prints from a number of smaller tracings of varying size, they can be fed by hand on to the photo paper as it travels to the contact rollers, and having passed between them and the contact plate they drop into a tray, ready for washing. The cost of the single type of machine is £70 for 30 in. tracings, and for the double machine £95. Messrs. Halden also exhibit a photo-printing, developing and drying machine which is of interest to firms requiring large numbers of copies.

Another exhibit of this class is the Shaw continuous rotary electric copying machine, made by Mr. Leonard Shaw, of 39, Victoria Street, S.W. This is of the old upright cylinder type with apparatus for lowering the lamp in the centre, but instead of being stationary the paper is passed around the cylinder, thus enabling prints of any length to be taken in one piece, by being simply fed into the apparatus. The cost of the 30 in. machine is £45. Only one lamp is required and a printing speed of 2 ft. per minute is attainable.

Lamps and Special Lights.

The varieties of arc lamps to be seen burning at the exhibition are multitudinous, but as we are not specially concerned with them we do not propose to go into any details of their construction. We would draw attention, however, to the flame lamps to be seen at several stands, and particularly to the "Orisflamme" arc lamps burning at the stand of Messrs. Oliver & Co., of Cambridge Place, Burridge Road, Woolwich, which lamps burn from forty to fifty hours with each trimming, are of low wattage consumption, and cost about the same for carbon as the ordinary open type arc lamp. The light given is a very pleasant warm yellow colour, far more agreeable than the usual cold-looking arc light. We would also draw attention to the well-known Jandus lamps on the stand of Messrs. Drake & Gorham, Ltd., and to the lamps of inverted type exhibited at the stand of Mr. G. Braulik, of 217-18, Upper Thames Street, E.C.; the latter being particularly suitable for lighting art schools and other buildings where a diffused light is most desirable.

Among the other lamps there are numerous novelties. The "Tantalum" electric glow lamp, possessing a filament of the rare metal tantalum instead of carbon, is in evidence at one or two stands. This lamp has its filament widely extended, and gives a better distribution of light than the ordinary lamp, and there is no blackening of the bulb. The makers say that the lamp is of high efficiency, and requires only half the current of an ordinary lamp of similar voltage and candle-power.

The "Osmi" lamp—the invention of von Welsbach—is shown by the General Electric Co. In this the filament is of osmium, and the makers claim for it that a saving of about 56 per cent. of current is effected, that the lamp has a longer life, and that the light is white and more effective than the ordinary lamp.

Another new light is the Bastian mercury vapour lamp, which is exhibited by Messrs. Rumney & Rumney, of 39, Victoria Street, Westminster. This is an enclosed arc lamp with mercury in place of carbon electrodes, and is said to burn for a very long time. The light, however, resembling moonlight, is not a pleasant one: and somewhat similar criticism applies to the "Linolight" lamps exhibited by the Linolight Co., of 25, Victoria Street, S.W. As the name implies, this lamp gives a line of light, and though certainly suitable for shop windows or similar purposes we hardly consider it a pleasant light for ordinary use. It is made in lengths from 1 in. to 8 ft. 6 ins., and costs 1d. per yard per hour for energy at 6d. per B.T. unit.

Another novelty is the Economical Turn-down lamp, exhibited by Messrs. Geipel & Lange, of Vulcan Works, St. Thomas's Street, S.E. This has two filaments, one as ordinary and the other a 1-c.p. filament. Arranged in the cap of the lamp is a switch operated by two cords. Thus when the light is desired to be turned down it is only necessary to pull one of the cords, and similarly to pull the other cord when the full light of the lamp is required.

Of the many imitation candle-lamps shown we can only say that we think they are rather a mistake, as electric light offers so

Pendant in antique copper with obscured glass

Two-light bracket, inlaid.

"EDISWAN" FITTINGS.

many possibilities of treatment particular to itself that it seems rather a misapplication to copy the old candlelight.

In referring to the lamps at the exhibition we cannot omit reference to the most interesting exhibits by Messrs. Robertson Electric Lamps, Ltd., and the Edison & Swan Co., both of whom have a number of girl operators at work, giving a practical exhibition of the various stages of lamp manufacture. The exhibit of the Edison & Swan Co. is especially good, and one which is watched with the keenest interest by every visitor.

Electric-light Fittings.

There are so many delightful new ways in which electric light can be used that we are glad to see many of the makers have abandoned the old familiar types associated with gaslights, and on many of the stands some most artistic pendants and brackets are exhibited. It is of course impossible to attempt to describe these, as they need to be seen to be appreciated, but the accompanying illustrations serve to show what is meant. The Edison & Swan Co. have an exhibit comprising every variety of fitting; also the General Electric Co., who have a specially good show, as well as Verity's Ltd. and Mr. Albert C. Hands, of Snow Hill, E.C. Other makers, such as Messrs. Escare & Denelle, Ltd., of 129, Wardour Street, W., have gone back to the old periods—Louis XIV., XV., XVI., Empire, Georgian and Adam—for models, and certainly some of the exhibits are very effective, though we still consider that the more modern treatment is better.

Electric light fittings on French models are also to be seen at the stand of the General Electric Co., who have made a speciality of replicas from the "Mobilier Nationale," two

FIVE-LIGHT ELECTROLIER BY GENERAL ELECTRIC CO., LTD.

Electric fan and motor combined.

Fan fixed to ceiling, the running weight and thrust being borne by anti-friction discs in close-ended bearing.

TYPES OF BLACKMAN ELECTRIC FANS FOR VENTILATING.

new showrooms at their headquarters in Queen Victoria Street having been specially designed and decorated to show these in position. The firm's catalogue offers quite a range of crystal fittings entirely modern in style and feeling; these are very delightful and fresh, the metal parts being complementary to the crystal, as opposed to the old style of glass electroliers—so cold and forbidding. Another speciality is the design and manufacture of wooden fittings, which are, for the most part, free from eccentricity. The pendants and electroliers shown by this firm are suspended by patent chains designed to successfully screen the flexible leads, without losing the simplicity and charm of the oval link chain.

Switches and Pushes.

The Edison & Swan Co. have an extensive exhibit of Tumbler switches. These are of the well-known tumbler type, and are very smooth in action. They are made in every possible variety, and with excellent finish. Another type of switch shown by this company is the button switch with wedge movement, which, by the simple motion of pushing the button, either cuts on or cuts off the current, thus effecting by one movement what has hitherto required two separate pushes. Their key switch for asylums, &c., is also interesting. We illustrate it below.

In the matter of neat and artistic pushes the exhibit of Messrs. Bonnell & Son, Ltd., of 58 and 60, Mortimer Street, Cavendish Square, W., is worthy of careful attention. These switches are of the most delightful design, especially some in Adam style, while a special exhibit is made of switches in a new material called Ivoride, which is non-flammable and can be produced in many attractive varieties.

Very artistic pushes and fittings are shown by Messrs. B. Dellagana & Co., Ltd., of Bromells Road, Clapham, these being in Kupron - Bronze—a process of electrically deposited copper adaptable to many requirements.

"EDISWAN" SWITCH OPERATED BY 3-PRONG KEY, FOR ASYLUMS, &c.

Telephones.

The telephone, now so established a feature of business life, has latterly been forcing its way into domestic use, and the architect is often required to provide a system extending throughout the various rooms of the house, while the same system of intercommunication is found to be of the greatest service in offices and other places. We draw attention therefore to the numerous house telephones to be seen at the exhibition. There is a very good one on the stand of the General Electric Co., consisting of a neat apparatus with a series of push-buttons by which it is possible to at once set up connection with any desired room, while on replacing the handle on the hooks the line is cut off and put into the normal position ready for a fresh call. Another of these useful wall instruments is shown by the Electric and Ordnance Accessories Co., Ltd., of Stellite Works, Birmingham. This company makes a "Homestead" set costing only 34s. and comprising two instruments, with hand sets, bell-pushes, &c., two dry cells and 30 yds. of wire, suitable for use between dining-room and kitchen, study and pantry, or from the private office to the clerk's office.

Electric Motors, Hoists, Fans, &c.

The number of electric motors in the exhibition is multitudinous, and we cannot possibly refer to them in detail. We can only mention that the use of such motors for driving mortar mills, and especially for hoisting materials on buildings, is very economical when current is available at a reasonable rate, and in this connection the motors are worthy of the attention of all builders and contractors visiting the exhibition. We notice that Messrs. Vickers, Sons & Maxim, Ltd., show a winch to lift 5 tons at the rate of 70ft. per minute with a 40-h.p. motor working at 220 volts continuous current; while other motors of a similar type are exhibited by the General Electric Co.

Messrs. Siemens Brothers & Co., Ltd., and Messrs. Crompton have specially extensive exhibits of motors of all sizes.

In the matter of fans, either belt-driven or direct-connected to motors, Messrs. James Keith & Blackman Co., of 27, Farringdon Avenue, have a good exhibit. Their well-known fans are of two types, induction or series, and can be adapted for continuous or alternating current. Special attention is directed to those which have motors combined with the fans, as they are very neat in design. These fans are invaluable for ventilating, cooling, heating, drying, &c.

A number of fans are shown by the Sturtevant Engineering Co., of 147, Queen Victoria Street, E.C. There is nothing particularly new in their design, and we can do no more than draw the attention of visitors to them. This firm has executed a great deal of ventilating work, and in this connection

their exhibit is particularly interesting to architects.

A novelty in the way of fans is shown by the Electric and Ordnance Accessories Co., Ltd., of Cheston Road, Aston, Birmingham. This fan has a pocket in which a sponge saturated with deodorant, scent, &c., is placed and through which the air is delivered. This fan is useful therefore for hospitals, &c., in supplying disinfected air or for delivering perfumed or deodorized air to ordinary rooms.

An exhibit of interest to architects is the Wade Jones "oil-dynamo"—a combined oil-engine and dynamo (the latter of "Witton" type, made by the General Electric Co., Ltd.). This is most useful for country-house lighting, being always ready for work, and very neat and compact. It is exhibited by Messrs. A. P. Wright & Co., of 60, Queen Victoria Street, E.C.

The use of electricity in dairy and farm premises is shown by Messrs. Drake & Gorham, Ltd., of 66, Victoria Street, who exhibit a three-throw pump, dairy apparatus and chaff-cutter electrically driven.

Lifts.

We are surprised to see so few exhibits of electric lifts at the exhibition. Several well-known makers, such as Messrs. Waygood and the Otis Co., are absent. The Easton Lift Co., Ltd., have erected two lifts from the floor of the hall to the gallery, and these can be examined as full-sized specimens. They are direct-coupled passenger lifts, each carrying twelve persons (or 18 cwts.) through a height of 20ft. at a speed of 150ft. per minute, and each is fitted with the firm's latest type of car switch controller. At one or two stands small models of lifts are shown, as, for instance, that of the Auto-Controller and Switch Co., of Vienna Road, Bermondsey, S.E., who show their patent press-button automatic lift. This can be brought to any floor by simply pressing the button, and can

"SIMPLEX" WATER-TIGHT MAIN SWITCH.

SIMPLEX CONDUIT BENDING MACHINE.

be operated inside the cage in a similar automatic manner. No attendant is required to work the lift, and it is therefore of particular service in buildings where economy has to be studied, or where visits are so infrequent or at such unusual hours that the attendance of a lift man would be undesirable. Stigler press-button lifts are also shown by Messrs. J. E. Spagnoletti & Co., of Goldhawk Works, W.

Wiring.

In wiring, the old system of wooden casings has now gone out of favour and its place has been taken by steel conduit, which is very much neater in appearance, safer and altogether better.

The Simplex Steel Conduit Co., Ltd., of Birmingham and London, have a very attractive stand on which all the applications of their system are shown. Readers are already conversant with these, and there is no occasion now to refer to them in detail. Suffice to say that every kind of fitting is exhibited, as the above illustration of the stand indicates. The only detail which we now mention is the Simplex conduit bending machine. This is a very convenient and portable tool, comprising a wooden lever, a hinge link and a bending mould with two grooves of different radii. While being bent the tube lies well in the groove of the mould, and takes up the desired bend without flattening or injury.

Union Papirsteel Insulated Conduit is shown by the General Electric Co., Ltd. The method adopted in the manufacture of this conduit is entirely different to that previously employed, as the tubing is drawn on to the insulated lining, instead of the insulation being expanded into the tube. This ensures the lining being held securely in place and avoids the possibility of its being drawn out when wiring.

For temporary wiring the system of Messrs. Simmonds Brothers, Ltd., of Newton Street, Holborn, W.C., is especially interesting to builders. It is a curious fact that the temporary wiring of rooms, &c., has very often to be done so hurriedly that the work is not so good as it should be, and consequently the risks of fire are greater; moreover, it is probable that a temporary building will be much more inflammable than a permanent building would be; it is therefore very

important that the wiring should be such as to avoid any risks of fire or shock. Messrs. Simmonds employ a wire enclosed with rubber and wound round with flexible steel tube of $\frac{3}{16}$ in. diameter. This is made up in convenient lengths, and a patent mechanical coupling is fixed at each end, so that any desired length can be had, and fittings connected where desired. One particular merit of the system is that the tubing forms a continuous metal conductor which can be connected to earth; thus an accidental shock can hardly be possible. We understand that the firm do a large business in hiring out their leads and fittings for temporary wiring, but contractors frequently requiring electric light on buildings would of course have their own installation.

Another wiring novelty to be seen at the exhibition is the "dead-wire" system of Mr. A. Blackmore, 5, Montpelier Street, Brompton Road, S.W. In this system there are no "live" wires except those in actual use for lighting or power, and thus the risk of fire is reduced. With the ordinary system a faulty joint may be the cause of fire, whether the light is on or off, by reason of short circuiting, whereas in this new system there is one continuous conductor for every light, both lead and return, without a joint from the light to the switch at the source of supply. The light is put on or off by push-button switches very neat and small, in comparison with which the usual tumbler switches are extremely bulky: and this is not the least interesting feature of the system.

In conclusion, we may say that the exhibition is open from 10 to 10 till October 21st. A small loan section has been arranged in connection with it, and a series of lectures is being given by various authorities. On Tuesday last week Colonel Crompton read a paper on the "Development of the Use of Electric Motors," referring especially to their use in the house; while on Friday Mr. Swinburne read a paper on "Domestic Electric Lighting." Other papers will be:—Wednesday, October 11th, "Electric Heating," by Mr. Dowsing; Friday, October 13th, "Electric Telegraphy," by Mr. A. Martin; Tuesday, October 17th, "Electric Arc Lighting," by Mrs. Ayrton; Wednesday, October 18th, "Electric Traction," by Mr. W. M. Mordey; and Friday, October 20th, "Telephones," by Mr. F. Gill.

The ancient Chapel of St. Nicholas, within Carisbrooke Castle, which was reopened and dedicated by the Bishop of Winchester last week, has been restored as a national memorial of Charles I., who was imprisoned within the walls of the castle. The work has been carried out under the direction of Mr. Percy Stone, F.S.A., F.R.I.B.A.

The Forum Excavations: What Comm.

Boni is doing.—Commendatore Boni, the director of the Forum excavations, is repairing the Arch of Septimius Severus at Rome, which badly needed attention; he is covering the *lapis niger* with a proper roof; and he intends to proceed at once with the exploration of the site of Domitian's horse. He has had to suspend further operations on the Clivus Palatinus until the Ministry of Education has made up its mind whether it wishes the Forum and the Palatine to be united.

AT OLYMPIA

STANDS Nos. 113 and 130.

Engineers, Architects and others interested in the electric wiring question are asked to visit our stand and inspect the most recent developments in conduit wiring practice. We have a qualified staff of representatives always in attendance who will be pleased to give any particulars required.

Contracts Open.

TO BUILDERS AND CONTRACTORS.

TENDERS are invited for the ERECTION of 61 HOUSES, for the Gadlys Uchaf Building Club, Aberdare. Plans and specifications may be seen and all particulars obtained at the offices of the Secretary.

Tenders, sealed and endorsed, to be sent to the SECRETARY, Mr. T. D. Williams, Accountant, 10, Canon Street, Aberdare, on or before the 21st day of OCTOBER, 1905. The lowest or any tender will not necessarily be accepted.

TO BUILDERS.

The Guardians of the Eton Union invite TENDERS for the ERECTION of a new INFIRMARY at the Workhouse at Slough.

Persons willing to tender are to send their names to Messrs. Charles Smith and Son, 164, Friar Street, Reading (architects to the Board) not later than SATURDAY, the 14th of OCTOBER, instant, who will arrange for plans and specifications to be seen.

Bills of quantities and forms of tender will be furnished on receipt of £2, which will be returned to persons sending a bona-fide tender.

The date for the delivery of tenders will be fixed hereafter.

The Board do not bind themselves to accept the lowest or any tender.

Slough, Bucks,
3rd October, 1905.
R. H. BARRETT,
Clerk.

URBAN DISTRICT COUNCIL of HENDON.

TO ROAD CONTRACTORS, GRAVEL MERCHANTS, CREOSOTED WOOD FENCING MANUFACTURERS.

The above Council is prepared to receive TENDERS for certain works of LEVELLING, TAR-PAVING, METALLING, KERBING, CHANNELLING and other works in fully making up Montagu Road, West Hendon, under Section 150 of the Public Health Act, 1875.

Also for the SUPPLY and DELIVERY to Hendon or Cricklewood Stations (Midland Railway) about 500 to 1,000 tons of CLEAN-WASHED SHINGLE (to pass through an 1/2-in. sieve and be retained on a 3/32 of an inch sieve).

Also for the SUPPLY and FIXING of about 250 yds. of CREOSOTED DEAL POST and RAIL FENCING near the Silk Bridge, Edgware Road, West Hendon, all within the Urban District of Hendon.

The drawings and specifications may be seen and forms of Tender obtained of Mr. S. SLATER GRIMLEY, Engineer and Surveyor to the Council, at the Council Offices, The Burroughs, Hendon, N.W., on deposit of £3 3s. for each form of Tender, which will be returned on receipt of a bona-fide Tender, accompanied by the schedule of prices duly priced in, except in the case of the accepted Tender, when such deposit will be returned on the execution of the necessary Contract and bond. Failing such execution the deposit will be forfeited.

Sealed Tenders endorsed "—" as the case may be, addressed to the Chairman of the Council, to be sent to the undersigned not later than FOUR o'clock p.m., on MONDAY, the 16th OCTOBER, 1905.

The Council do not bind themselves to accept the lowest or any Tender.

Dated this 30th September, 1905.

HENRY HUMPHRIS,
Clerk to the Council.
Council Offices,
Hendon, N.W.

EAST SUSSEX COUNTY COUNCIL.

TO BUILDERS.

TENDERS are invited for the ERECTION of new POLICE OFFICES and SUPERINTENDENTS' HOUSES and ALTERATIONS to the existing BUILDINGS at Lewes, for the East Sussex County Council.

Plans, specification, and conditions of Contract may be seen, and bills of quantities obtained, after FRIDAY, 6th October next, on application to Mr. F. J. WOOD, County Surveyor, Lewes, between the hours of TEN a.m. and FOUR p.m. (Saturdays Ten a.m. and One p.m.), on payment of a deposit of three guineas, which deposit will be returned upon the receipt of a bona-fide Tender.

The contractor whose Tender is accepted will be required to enter into a Contract with the County Council and, if required, enter into a bond with two approved sureties for the due carrying out of the Contract.

Tenders, endorsed "Tender for New Police Offices and Superintendents' Houses," to be addressed and delivered to the undersigned at the County Hall, Lewes, not later than TEN a.m. on FRIDAY, 27th OCTOBER, 1905.

The County Council does not bind itself to accept the lowest or any Tender, and will not pay any expenses in connection with the preparation thereof.

F. MERRIFIELD,
Clerk of the County Council.

County Hall, Lewes,
12th September, 1905.

£750 claim paid.

The following list is interesting, as it gives particulars of some of the claims that have been paid under the BUILDERS' JOURNAL Insurance Schemes. The ease with which an accident happens, and the heavy expense often incurred by doctors' bills and loss of occupation are subjects that every thoughtful man has to consider, and there could not be a better method of protection than such Insurance policies:

Builder.—Injury to left arm necessitating amputation. £750.

Architect.—Slipped down steps while carrying bicycle. £6.

Builder.—Kicked by horse. £10 10s.

Architect.—Trod on rusty nail, which entered toe. £4 10s.

Architect.—Slipped on floor, and in falling struck arm of chair. £1.

Builder.—Injured face, left eye, and foot. £6.

Only subscribers to the BUILDERS' JOURNAL are entitled to benefit under our Insurance Schemes, which are guaranteed by "The Ocean Accident and Guarantee Corporation, Limited." A pamphlet giving particulars will be sent on request, and every subscriber should avail himself of one of the following Three Schemes of Insurance.

These are the three Schemes:—

(1) A Free Accident Insurance of £500.

(2) An Accident Insurance of £500.

And also

£250 for Permanent Total Disablement.

£2 10s. per week for Temporary Total Disablement.

Premium, 1/-

(For the conditions under which policies Nos. 1 and 2 are issued readers should refer to our pamphlet, sent on application.)

(3) An Accident Insurance of £1,000,

£500 for Permanent Total Disablement,

£6 per week for Temporary Total Disablement,

with special advantages fully detailed in our pamphlet.

Bankruptcies.

DURING THE WEEK ending October 6th sixteen failures in the building and timber trades in England and Wales were gazetted.

J. SHATTOCK, builder, Newport. Deficiency £1,379.
J. G. W. BONE, builder, Leicester. Liabilities £1,358; assets £572.

C. W. GILLING, builder, Forest Gate and Sheerness. Adj. Sept. 25th.

W. E. CAPON, builder and contractor, Manningtree. Liabilities £1,172; assets £469.

J. J. MULLITT, builder and contractor, Dudley. P.E., Dudley C.C., Oct. 13th, at 11.

J. D. HODKIN, joiner and builder, Sheffield. Adj. Sept. 27th.

D. THOMAS, builder and contractor, Cardiff. Adj. Sept. 22nd.

J. T. BROWN, builder, Nottingham. Liabilities £579; assets £120.

C. GIMSON, builder and contractor, 23, Lawrence Lane, E.C. Unsecured debts £4,114; fully secured £26,588; assets estimated at £3,473.

P. NICKELLS, plumber, Totnes. First meeting, O.R.'s Plymouth, Oct. 12th, at 11. P.E., East Stonehouse, Town Hall, Oct. 12th, at 12.

R. TAVENER, builder, Forest Gate. First meeting, London Bankruptcy Court, Oct. 12th, at 11. P.E., same, Nov. 7th, at 11.50.

A. WITCOMB, painter and decorator, Bristol. First meeting, O.R.'s, Bristol, Oct. 11th, at 11.30. P.E., Bristol Guildhall, Nov. 17th, at 12.

G. SWINNERTON, builder and contractor, Aintree, Liverpool. First meeting, O.R.'s, Liverpool, Oct. 11th, at 12. P.E., Liverpool C.C., Oct. 12th, at 11.

J. G. W. BONE, builder, Leicester. First meeting, O.R.'s, Leicester, Oct. 11th, at 12. P.E., The Castle, Leicester, Oct. 20th, at 10.

T. NIXON, builder, London, E.C. First meeting, Bankruptcy Court, Oct. 11th, at 11. P.E., same, Nov. 12th, at 12.

W. EBDON, painter, Newbiggin-by-the-Sea (late Hirst). First meeting, O.R.'s, Newcastle-on-Tyne, Oct. 11th, at 11.30. P.E., Newcastle C.C., Oct. 19th, at 11.

C. OWEN, architect and surveyor, Walsall. First meeting, O.R.'s, Wolverhampton, Oct. 11th, at 11. P.E., Walsall C.C., Oct. 20th, at 11.30.

F. J. REEKS, plumber, Barnes. First meeting, 24, Railway Approach, London Bridge, Oct. 11th, at 11.30. P.E., Wandsworth C.C., Oct. 19th, at 12.

H. BOOR, plumber, Aston. First meeting, 191, Corporation Street, Birmingham, Oct. 13th, at 12. P.E., Birmingham C.C., Nov. 15th, at 2.

J. W. CALVERT, painter and decorator, Starbeck and Harrogate. First meeting, O.R.'s, York, Oct. 12th, at 2.30. P.E., York Courts of Justice, Nov. 3rd, at 11.

A. POLSUE-BURROW, builder, Bradford. First meeting, O.R.'s, Bradford, Oct. 13th, at 3. P.E., Bradford C.C., Oct. 25th, at 10.

Coming Events.

Thursday, October 12.

ROYAL INSTITUTE OF PUBLIC HEALTH.—Harben Lecture by Prof. T. Oliver, at 5 p.m.

INSTITUTE OF SANITARY ENGINEERS.—Visit to Chelsea Electricity Generating Station.

CARPENTERS' COMPANY.—Prof. D. S. Capper, of King's College, on "Sites: Wet and Dry Foundations," &c., Carpenters' Hall, London Wall, at 7.30 p.m.

MANCHESTER SOCIETY OF ARCHITECTS.—Special General Meeting at 6.45 p.m.

Friday, October 13.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Annual Dinner in Newcastle.

Saturday, October 14.

HALL'S

Sanitary Washable DISTEMPER

Made in 70 Colours

A Practical Labour Saver.

Hall's Distemper only requires water added to be ready for use.

Its covering power is unequalled by any similar material. One cwt. of Hall's Distemper will cover double the surface of one cwt. of pure white lead paint, with 40% less cost in labour.

Good walls require no preparation.

Hall's Distemper works easily, sets hard, and dries with a uniform surface, equal to flatted oil paint.

Made in two qualities for Inside and Outside work.

*Sample and Shadecard on application to
Sissons Brothers & Co., Ltd., Hull.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

October 18, 1905. Vol. 22, No. 558.

6, Great New Street, Fetter Lane, E.C.

Summary.

Earl Carrington says he has built forty-three new labourers' cottages on his estate at an average inclusive cost of £156 13s. per cottage, and he offers to let any landowner or land agent see the plans and specifications. —The cheap cottages exhibition closed on Saturday. (Page 220.)

The knowledge of the strength of brickwork is unsatisfactory, and new tests ought to be undertaken. No adequate theory can be attempted at present, as the existing tests were unscientifically performed. (Page 228.)

In taking levels when developing an estate it is as well to put in stumps about every two chains apart. A good plan is to have the stumps about 2ft. long, driven until the tops are level with the surface of the ground; then to excavate round the stump about 1ft. diameter and 6ins. deep, and fill in with cement-concrete level with the top of the peg. (Page 219.)

The excavations in connection with the shoring-up of the exterior of the east end of Winchester Cathedral have revealed a serious fracture in the walls, which widens as it descends. £2,000 is needed immediately to repair the damage. (Page 230.)

Ayr Bridge has been respited for four months to enable those interested in its preservation to provide the means of restoration and also to satisfy the Ayr Council that the methods they propose will be such as to ensure permanency. (Page 230.)

The general tone of the London timber trade during September was good; the volume of trade improved, and a confident feeling as to the future continues to gain ground. Reports from the Liverpool market speak of greater activity, due to the more settled condition of trade after the holiday season. (Page 223.)

There are instances whereterne plates have been known to last on a roof 100 years. There is a church in Vermont, U.S.A., whose steeple was covered with iron plates coated with pure tin in 1816, and it had never been painted up to 1903—eighty-seven years on a roof. (Page 227.)

A detailed description of the design and working-out of reinforced concrete lintels appears on p. 221.

Plans for the Usher Hall at Edinburgh have been approved by a special committee of the town council, though another delay has been made by the opposition of some councillors to the pulling down of the Synod Hall. (Page 218.)

In his presidential address to the Manchester Society of Architects Mr. J. H. Woodhouse described "new art" in architecture as a mere caprice of the hour: it was not that which architects needed, but a knowledge and appreciation of old art adapted to modern conditions. (Page 229.)

Architects Boycotted by Builders.

STRANGE news reaches us from Yarmouth. This is the alleged threat of the Master Builders' Association to boycott any architect who does not give members of that Association the sole opportunity of tendering for work. The facts are as follows:—Mr. W. Lake, architect to the Great Yarmouth Board of Guardians, had prepared some alterations to the lunatic wards at the workhouse—a comparatively small undertaking—and tenders had been invited from "builders and others," but the architect refused to supply specifications to builders who were not members of the Master Builders' Association. When the point was raised at the meeting of the Guardians the architect gave as his reason the fact that other architects had been boycotted for not reserving their work to members of the Association, this boycott taking the effect of refusing to submit tenders for any work in hand. Mr. Lake said that all architects in Yarmouth were dictated to in this way. Of course this raised the ire of the Guardians, and they had the whole of the tenders burned without being opened. This is only a local affair, but if the facts are as stated it is certainly scandalous, and it is the duty of the Institute of Builders and the Master Builders' Association of Great Britain and Ireland to take up the matter and excommunicate this body. The formation of a ring is never relished by the British public, and any tendency in this direction must be put down with a firm hand. One of the reasons urged for the formation of municipal works departments has been the existence of this tendency to restrict work among the chosen few, but if architects are thus dictated to, the contractors will find an unwelcome surprise awaiting them. In the meantime the Yarmouth Board of Guardians have decided to advertise again for fresh tenders.

Bed-places.

ONE noticeable feature of French planning is the arrangement of an alcove for the bed in sleeping-rooms. This is a commendable feature, though we seldom see it adopted in this country. Alcoves are to be found in Scottish domestic work of the smaller kind, it is true, but they are never made such a feature as abroad. A similar arrangement is usual in Switzerland and Norway. In some cases the bed-place is enclosed by means of sliding doors, but in the majority of instances curtains are used. The improvement in appearance which this effects in a bedroom is very marked, and it allows the room to be used as a sitting-room. It is an arrangement which would be advantageous in small houses for country labourers, and the working classes, who require all the space possible

for bedrooms, and if an alcove were arranged in the sitting-room or kitchen it could be enclosed by a curtain when desired and would certainly be better than leaving the occupants either to erect the bed each night and take it down in the morning, or have it continually lumbering the place and being in sight. Even in large bedrooms in town or country the alcove could be utilized, for a person might be confined to the bedroom, or desirous of sitting there for reading or writing, and he could transform the room into more of a sitting-room if the bed could be enclosed. In hotels or dwellings for single men or women lodgers, who have only a combined bed-sitting-room, the arrangement is an admirable one. In planning such bed-places, however, it is well to remember two very necessary things, namely, to give sufficient space round the bed for it to be drawn out, and made easily; and secondly, to afford thorough ventilation, as it would be harmful if air were confined in a small space like this. With regard to this last, a good arrangement is to provide a lattice-work screen coming down some distance from the ceiling, the curtain for enclosing the alcove being suspended from the bottom of this.

The Eve of Architecture.

WE notice that a new rule of the Regent Street Polytechnic excludes women from attending the architectural classes held by that institution, and the occasion has been taken by interested persons to make a protest in the press against such exclusion. The subject of the lady architect is a familiar one to the profession, but we do not find that it makes any very practical headway. So far as admitting women to architectural classes is concerned, we do not see why they should not be allowed to do so; it does no harm to anyone, and it pleases the ladies! For ourselves we regard the advent of the lady architect rather as a joke, for we feel that she has neither the practical ability nor the necessary command of speech to overawe the builder and his workmen. Her sex is undoubtedly against her, and though she may find useful employment in decoration, it seems a hopeless task for her to successfully attempt architecture as a profession, despite the fact that a lady architect designed one of the cottages at the Garden City exhibition, that there happen to be two or three lady architects who are associates of the Institute, and that some varieties of slates are named after women, titled or otherwise! Perhaps it is within her ability to undertake the designing of a small house, but the idea of a lady being given the working-out and supervision of, say, a town hall or a block of city premises is ludicrous.

Correspondence.

The Misapplication of the Term
"Groined."

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In your issue for October 4th the new porch at St Mary's, Lancaster, is said to be "groined." Is not this an error, and a very common one too? Surely it must be a ribbed vault, not a groined one, that is meant. Popular guide-books and people generally speak very loosely of groined vaults and groined ceilings when they mean, most likely, ribbed vaults—very different constructions; but such looseness of expression should not be permitted amongst architects. A groined ceiling, having no ribs, cannot be a ribbed one, and, therefore, conversely, if a groined ceiling cannot be a ribbed one, a ribbed ceiling or one constructed of ribs and having the interstices filled with stones resting on the ribs cannot by any possibility be a groined one. A groined vault is the intersection of at least two barrel vaults, whether pointed or not, the lines of intersection forming the groins: such vaults need centering beneath the whole of their surface during construction. In ribbed vaulting, ribs or narrow arches of stone take the place of these intersections or groins, and if the ribs be plentiful enough only those need centering, and very light ones, the interstices being filled in afterwards without any centering whatever. Hence the principle and method of construction of the one are very different from those of the other. If I may say so, the word "groined" is a negative term to indicate the absence or non-continuation of the vault at certain points, while "ribbed" is a positive term indicating the presence of a special member or feature—in fact, of the most important constructive feature of the vault. Take away the whole of the filling of a ribbed ceiling, and the ribs would still remain (e.g., the Berkelev Chapel, Bristol); take away the filling of a groined ceiling, and where would the groins be?

The groined vaults of Norwich aisles would need very different centering to the high ribbed vaults in the nave and choir.—Yours truly,
ROBERT A. DAVIS.

[Our correspondent is quite right in his contention.—Ed. B.J.]

DESIGN FOR EDINBURGH CITY HALL: ELEVATION TO CASTLE TERRACE.
R. MORHAM (CITY ARCHITECT) AND JAMES A. WILLIAMSON (DEPUTY CITY ARCHITECT).

THE EDINBURGH CITY HALL.

NEW plans for the much-talked-of Usher Hall or City Hall at Edinburgh have been prepared by Mr. Morham, the city architect, and Mr. James A. Williamson, A.R.I.B.A., deputy city architect. The idea kept in view in designing the front elevation was to bring the edifice in harmony with the general architectural tone of the city. Edinburgh is not a modern town; and in the prominent site which the hall will occupy any departure from the traditions of the ancient capital of Scotland would be accentuated.

The central or grand hall, to seat 3,500 persons, has its principal entrance to Castle Terrace, the site at present being covered by the Synod Hall, formerly the old Edinburgh Theatre. The general area of the hall is on the street-floor level, with balconies at the sides, a double gallery at one end, and platform, orchestra, chorus benches and organ loft opposite. Side entrances and corridors are provided right and left of the hall, and abundant provision is made for green-room, retiring-rooms and staircases. The kitchen and scullery are on the upper storey: and the heating, ventilating and store arrangements in the basement.

The hall is 175ft. long by 70ft. wide, and has a height of 56ft. The balconies are three rows deep, and there is a double gallery at the end opposite the platform, to which access is obtained by two staircases entering directly and independently from the outside. Behind and below the side and end galleries there will be a panelled hardwood dado, and the back of the choir is formed in a semi-circular screen of panelling. Ample light will be admitted by large semi-circular windows in lunettes above the main cornice.

Special attention has been paid to entrances and exits. Besides three wide doors from Castle Terrace, and two in each of the side entrance halls, seven of the staircases have each a separate door from the exterior. The combined widths of all the outside doors amount to 80ft., giving 1ft. per forty-four persons: and all doors open outwards. The inner entrance hall is 70ft. long by 25ft. wide, off which there is direct access to the main hall and the two principal staircases. Under the grand hall is the lower hall, 92ft. by 70ft., with independent access from the outside and means of communication with the grand hall.

In considering the cost it has to be kept

in mind that the former plans were on a most expensive scale. The total sum left by the late Mr. Usher was £100,000, to which has to be added interest for a number of years. The committee of the town council have decided to restrict the total outlay (including purchase price of site) to the amount of the bequest, and they have adopted these new plans. Exclusive of organ, sculpture and site, but including furnishing and fittings, the estimated cost is £78,270.

When the scheme was brought before the full meeting of the Edinburgh town council recently, delay was moved and carried, certain members desiring fuller information about an adjoining site before deciding to pull down the Synod Hall. The plans approved by the special committee were freely criticized by several of the councillors, but the matter now seems within distance of final settlement.

EDINBURGH CITY HALL.

LAYING-OUT ESTATES.

At a sessional meeting of the Institute of Sanitary Engineers held on October 4th a paper was read by Mr. A. A. Kemp, F.I.S.E., by way of opening a discussion on Estate Development. After observing that the construction of roads, the provision of a drainage scheme, water supply and lighting all came within the province of the sanitary engineer in connection with the development of estates on the fringes of towns, Mr Kemp proceeded to describe the work. First the estate had to be surveyed, which might be done with a chain in the ordinary way, but in many cases it was much better, and, in fact absolutely necessary, to use a theodolite, a magnetic compass, or a box sextant: the compass and the sextant were suitable for small surveys only, and should not be used for work of any magnitude. For accuracy

readings on the horizontal and vertical limbs. Keep the vertical arc clamped, and catch the sun on its descent by its intersection of the opposite side of the web of the instrument. Take the reading of the horizontal limb, and bisect the two readings; this will give true south. Now reverse the instrument and set up a ranging rod; clamp the instrument at zero and turn to the right, recording the angle at the first station, and proceed to read each angle round the traverse. These stations being fixed, the boundaries and set-offs can be obtained in the ordinary way. We are now in the position to make the plan.

"The next thing to be done is to lay out some schemes of roads. In deciding these it is well to have them arranged so as to get as many of the houses as possible facing the south. There should be one or two roads at least not less than 50ft. wide; for the inter-

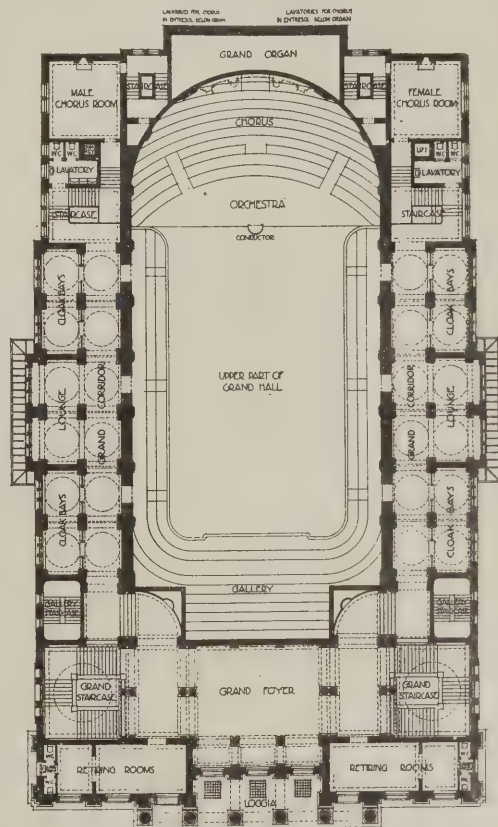

building land it has always been my practice to provide accommodation roads running between the plots at the rear. In these roads the sewers should be laid, as most of the houses are drained to the rear of the premises. Free access for the collection of house refuse is also given, and the constant repairs to the main street through sewer connections is greatly minimized; and another great advantage is the prevention of carrying the house drains under the buildings.

"Having decided roadmaking, our next question is to provide a sewage-outfall works and main drainage scheme. The first stage is to take levels over the routes laid out for the sewer. In new works, where there is only a field before one and no points that can be definitely used as bench marks (such as there are in towns), it would be well to put in stumps about every two chains apart, for the purpose of levelling, although I have seen

Principal Floor Plan (Castle Terrace Level).

EDINBURGH CITY HALL.

First-floor Plan (Balcony Level).

nothing was so reliable and satisfactory as the theodolite, when using which the traverse system of surveying was generally adopted.

"Before actually proceeding with a survey it is always as well to wall round the land once or twice, and make notes of the various positions, and to fix your stations. If you can obtain an Ordnance map of the district a rough sketch diagram should be made, marking these points and numbering the angles. If an Ordnance map is not obtainable, a rough sketch diagram must be made in the field-book, showing the positions of the stations.

"When traversing it is usual to commence at the extreme western station. The true north is generally ascertained by getting the meridian from the sun.

"The instrument is set up about 1½ hours before noon, at the same time noting the

secting roads a width of 36ft. is sufficient. All these should be well drained and constructed with even gradients.

"As to the best material for roads and the thickness required for making a good bottom, this varies so much under local circumstances that it is quite impossible to describe what is necessary. It would be well to point out that the worst soil to contend with in road-making is clay. In every case the site of the proposed road should be lined with faggots or brushwood before any hard material is placed upon it. This should be covered with 12ins. at least of hard core, well rolled down to receive a 6in. covering of good pit flint, the whole to be well consolidated with a heavy steam roller. It is important that all gas and water mains should be laid before the roads are made.

"In laying-out an estate for the purposes of

these driven down and removed in some cases; thus when you are looking for the bench marks sometimes after taking the levels for laying the sewers you have no guide for fixing the sight rails. To obviate this, I have found that a good plan is to have the stumps about 2ft. long, driven until the tops are level with the surface of the ground; then to excavate round the stump about 1ft. diameter and 6ins. deep, and fill in with cement-concrete, level with the top of the peg. This is rather an expensive plan, but without this the cost of labour in picking up levels from distant points more than compensates for the extra expenditure."

Mr. Kemp then proceeded, in conclusion, to consider the sewage-disposal works or outlet, observing that it was important to arrange this if possible at the lowest point, so as to avoid any cost of raising the sewage.

CHEAP COTTAGES.

Close of the Exhibition at Letchworth.

THE exhibition of cheap cottages at Letchworth (Garden City) formally ended on Saturday last, though, of course, as the cottages are to remain—many of them having already been acquired—it will be possible for anyone to still see the outskirts of them, at least. The cheap half-crown return fare from King's Cross is no longer obtainable, but one can get a return ticket for 3s. 6d. any day.

Earl Carrington's Letter to the "Times."

A good deal of final criticism about the cottages has been going on during the past week, the most important contribution to the subject being Earl Carrington's letter to the "Times" of Thursday. Referring to Mr. J. St. Loe Strachey's statement that the present cost of a cottage in the country was at the very least £250, the noble earl says: "In my experience the alleged impossibility of obtaining a good substantial labourer's cottage with three bedrooms, living-room, kitchen and scullery for £150 does not exist, and I am sure that many landowners and a large number of practical land agents and builders who have been erecting hundreds of labourers' cottages throughout the country at a cost not exceeding £150 per cottage will agree with me in this. If landowners, when building cottages, gave definite instructions to their agents that the cottages were not to cost more than £300 per pair, they would find that it could be done for this amount; if, however, landowners simply instruct their agents to build a pair of cottages and give them *carte blanche*, the agents, naturally taking a pride in the estate and their work, turn out a pair of model cottages for £400 or £500 with unnecessary extravagance and costly ornamentation which in no way adds to the comfort of the labourers.

"To obtain cheap cottages there is no necessity to have recourse to 'wattle and dab,' or 'claybats' (consisting of clay and chopped straw dried in the sun). Such expedients may have been a necessity in the mediæval ages, but they are out of place in modern civilization.

"I have built on my estate forty-three new cottages at an average cost of £156 13s. per cottage. These cottages were built by contract in different places in Buckinghamshire and Lincolnshire, and included not only brick and slated cottages but also cottages in brick and tile; and, moreover, included the extra cost of piling for foundations to several pairs of cottages which were built in the Lincolnshire Fens, where the natural subsoil gives an unsatisfactory foundation.

"I have now adopted a standard design for cottages on the Carrington estate; the cottages are built in gin brickwork with slated roofs, and contain living-room and kitchen, each 12ft. by 11ft., washhouse, pantry and offices, and each cottage has three bedrooms. The average cost of these cottages has been £153 10s., which of course includes contractor's profit, and the wages paid have been the standard wage in the district. I have never had any difficulty with regard to by-laws, as these cottages will pass the by-laws of any rural district council. Nothing, of course, has been allowed for architect's fees, as the plans were designed by my agents, and with the specification have only cost the actual amount paid for lithographing copies. . . . Should any landowner or land agent wish to see the plans and specifications of the cottages I have built, I have instructed my agents, Messrs. J. Carter Jonas & Sons, Market Place, Cambridge (by whom they were designed), to forward them free on application."

Councillors' Criticism.

As representative of the Lambeth Borough Council Mr. Bristow visited Letchworth and

reported that not a house on the estate could be applied to London or its suburbs, that the boasted £150 was a myth, and the prize cottages were (in his opinion) defective. The company gave £40 per acre for the land, and they did not sell the freehold, but let on building leases at an average of £17 10s. per acre, which at twenty-five years' purchase came to about £400 per acre and left a good margin for the initial expenses of laying out the estate. With regard to the conferences on housing held at Letchworth, Councillor Bristow says: "I must call attention to the request for payment of 5s. for each delegate; for, allowing 500 delegates and 1s. per man for expenses, the company would clear about £100 per conference."

At last week's meeting of the Yarmouth Town Council a report was submitted by Councillors A. Stanley and W. J. Rushmer on the Letchworth cottages. The councillors carefully examined several houses of each class, and came to the conclusion that the detached cottages were not suitable for reproduction in Yarmouth, as they could not be economically built, and occupied a large amount of ground, but the semi-detached houses and the groups of four houses formed very desirable types of healthy, pleasant and well-planned dwelling-houses worthy of consideration in planning future areas and lending themselves to the improved architectural treatment of streets, but necessarily involving a larger amount of ground to each dwelling-house than at present.

Proposed Blackpool Exhibition.

A scheme of cheap cottage building carried out on an experimental scale at Cleveleys, near Blackpool, has provided so large a demand for cottages at the seaside that a project has been promoted for the holding of a competition next summer on lines similar to those adopted at Letchworth. The Fleetwood Estate Company has set aside a site for the exhibition, and a committee is engaged in the preparation of the details. The prizes offered are announced to be more advantageous than those of Letchworth.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Sanatoria.

J. C. M. writes: "Have you ever published any plans for small consumption sanatoria of about twenty to thirty beds suitable for a country town?"

No; we have published plans of the King's Sanatorium, and you ought to be able to draw up a satisfactory plan from these and from the several books and essays that have been published on the subject.

M.A., B.A., Society of Arts.

TOTNES.—H. J. writes: "What examinations have to be passed in order to obtain the degrees of Master of Arts and Bachelor of Arts; also what is the condition of membership of the Royal Society of Arts? To whom can I apply for application forms?"

Master of Arts and Bachelor of Arts examinations are held by all the Universities. The Royal Society of Arts is open to anyone on payment of the subscription; the address of the secretary is John Street, Adelphi, London, W.C.

Creosoting a Wooden Building.

WALTON-ON-THAMES.—E. H. writes: "Should creosote be applied hot or cold on a wood building, and is there such a thing as green creosote; if so, where can I obtain it?"

Creosote is usually applied cold but is not so efficacious as tar thus applied; timber should be boiled in the creosote. As regards a green creosote you probably refer to the green "Solignum"—a well-known wood-preserved, also in three shades of brown—made by Messrs. Major & Co., Ltd., of Hull.

Patent Bricks.

GLASGOW.—G. writes: "The Scottish Brick and Stone Co., Ltd., is now being floated to work a patented process of the Hydraulic Brick and Stone Co., of Liverpool. Can you give me any information about the quality and durability of the material? Has it been used in any important buildings, and are they in appearance and quality equal to terra-cotta or other facing bricks? Do you think such a company would be a success?"

We presume the bricks in question are made by a kind of sand-lime process. Bricks of this kind have been used for many years in Germany, France and America, and have been found satisfactory. The usual defect is their shortness and want of resistance to fire, crumbling under heat and water. With the object of overcoming these defects the Asbestos Brick and Tile Co., Ltd., of Lodge Place, St. John's Wood, London, N.W., who recently erected works for their manufacture, incorporate asbestos fibre, we believe. The process of setting the hydraulic lime is in all cases performed by steam under pressure in huge cylinders. The great merits of this class of bricks are the sharp arrises and exactness of form and pleasing colour at a slightly less cost than ordinary clay facing bricks.

Examination in Honours, Building Construction.

STOCKTON-ON-TEES.—F. T. S. writes: "I wish to pass the Honours, Building Construction examination, and intend to sit for Stage III. next May. I have passed Stages I. and II. I have both of C. F. Mitchell's building construction books, but would like another book on Stage III. or Stage III. and Honours (final) combined. Please recommend one. Also, where can I obtain particulars of the examination in architecture which all intending candidates for the Honours, Building Construction are required to pass, and where can I obtain questions set for same at the last examination?"

You will find Rivington's "Notes on Building Construction" (4 vols.) valuable to you not only for Stages III. and Honours but in after-life, and the money they cost is a good investment. The price of these volumes is given in our book list. The syllabus of the South Kensington examinations in building construction is to be purchased separately, price 1d., or bound up together with the syllabuses of the other S.K. examinations in the Board of Education's "Syllabuses and Lists of Apparatus applicable to Schools and Classes other than Elementary," price 4d., both published each year by Messrs. Eyre & Spottiswoode, East Harding Street, London, E.C. The examination papers are not published separately, but are to be obtained together with papers on other subjects in the "Science Examination Papers" for 1877 to 1888, 1890 to 1895, 1897 to 1899, and 1901 to 1904, price 6d. each, also from Messrs. Eyre & Spottiswoode.

Weight on Girder.

MANCHESTER.—F. J. A. writes: "Please give a simple practical method of determining the weight required to be carried by a girder in a case similar to that shown by the sketch sent. Am I right in assuming that as the brickwork is self-supporting

to a certain extent the weight of it can be determined by making a triangle with span as base and the top of the wall as apex, and allowing, say, 1 cwt. for each cub. ft. of brickwork? In this case how is weight of roof determined? I presume, of course, if joists run the opposite way there would be no weight for floor on girder."

All the loads being directly over the opening, they should be figured as resting on the girder, because the wall supports the weight of roof and ceiling in addition to its own weight, and also because the height of the wall is less than the opening. For lintels over small openings it is customary to assume that the lintels will carry only that part of the wall which is enclosed by an equilateral triangle whose sides are equal to the width of the opening in the wall. The weight of the wall can with sufficient accuracy be assumed to be uniformly distributed and figured thus:—

$$w = \frac{9' \times 120 \text{ lbs.} (16' \times 10' - 5'5' \times 3'5')}{12'} \\ = 12,667 \text{ lbs., or about } 5\frac{3}{4} \text{ tons.}$$

Connection to Sewers.

BUXTON.—G. A. E. S. writes: "A on sketch plan is a house at pre-ent in course of erection. It was arranged to construct a small septic tank in the grounds for the disposal of the sewage. My client now proposes to carry the drain straight through field D (about 100 yds. long), of which he is the owner, and connect to the nearest sewer at C. He also suggests that the drainage from a future house B could be connected to the drain, as shown by dotted line. Apart from possible objections by the local authorities, do you consider this advisable, or likely to lead to trouble in the future?"

It is certainly better to connect to the public sewer, from a health point of view. Small disposal plants should never be laid down unless absolutely necessary, as the treatment of sewage requires a knowledge, skill and attention that the layman is rarely able to give. At the same time there may be difficulties in the way of connecting to the sewer in this case. The proposed connection has to cross a public road to reach your client's other land. It is unlikely, too,

that the authority would permit the connection from B, as this would constitute the drain a sewer, repairable at the public charge, and this would confer on the authority a right of easement over your client's land to attend to and repair it. Even if the authority acquired the drain subsequently for the purposes of a sewer, its passage through your client's property might be found troublesome in the development or utilization of the land. If the authority were approached, it is possible, however, that some arrangement might be come to so that the sewer was extended up the road to a point near your client's house, he paying a sum not exceeding the cost of the private drain he proposes to lay.

Designing Reinforced Concrete Lintels.

GLASGOW.—J. M. J. writes: "I shall be glad to know what would be the cheapest and most suitable section for checked concrete or granolithic lintels for spans of 7ft. gins. and 6ft. 8ins.; distance to wall-head 8ft.; and for spans of 6ft. 8ins. and 4ft. with the roof only to support. The thickness of wall is 9½ins. (two 4½ins. with ½in. vertical asphalt). It will be rough-cast on the outside and plaster rendered on the inside. I intended reinforcing the lintels with steel bars or something equally simple, as the work will be carried out by a builder who has no experience of reinforced concrete. Diagram sent (not reproduced.)"

In the case of the two reinforced lintels with spans of 7ft. gins. and 6ft. 8ins. respectively, and blank wall above for a height of 8ft. carrying one wall-plate of roof 15ft. span: taking the 7ft. gin. lintel first, we have for load, say, wall 1ft. thick (including rough-cast, ½in. vertical asphalt, plaster and two 4½in. thicknesses of brickwork) at 1 cwt. per cub. ft.; and assuming the whole weight of superincumbent brickwork to come on the lintel = 7'75ft. × 8ft. × 1ft. thick × 1 cwt. = 62 cwt., plus 7'75ft. × 10ft. length of one rafter × ½ cwt. per sq. ft. for roof = 62 + 38'75 = say, 5 tons distributed along beam, as in Fig. 1. Assuming a beam gins. deep (three courses of brickwork) and 9½ins. wide (thickness of wall), as in section Fig. 2, and allowing an area of metal of $\frac{1}{60}$ th area of beam = $\frac{9'5 \times 9}{60}$

say $1\frac{1}{2}$ sq. ins., then for approximate tensile stress in steel or compression in concrete we have $\frac{WL}{8d}$, where w = load in tons, L = span

in feet, d = effective depth in feet. The effective depth is found by setting down a parabola with breadth of beam as base and depth to centre of reinforcement as height, and taking the centre of gravity of the parabola at $\frac{3}{8}$ of the height. Then the effective depth equals distance from centre of gravity of parabola to centre of reinforcement.

$$\frac{WL}{8d} = \frac{5 \times 7'75}{8 \times 4} = \text{say } 12'1 \text{ tons ten-}$$

sion. Allowing $7\frac{1}{2}$ tons per sq. in. for steel in tension, $7'5 \times 1'5 = 11'25$ tons safe stress, disregarding strength of concrete in tension. Testing the concrete for compression, the effective area will be as shown by the shaded parabola = $\frac{3}{8} \times 8 \times 9'5 = \text{say } 50$ sq. ins. at 500 lbs. per sq. in. = 11'16 tons safe compressive stress; so that the section shown in Fig. 2 will be about sufficient. For the 6ft. 8in. beam under similar conditions the same section may be adopted. Checking the above method by the formula used by the Trussed Concrete Steel Co. of America, again disregarding the tensile strength of concrete, $R = \frac{3}{8}(d - y) + y; aF$, where R = ultimate moment of resistance of beam, d = depth in inches to centre of reinforcement, y = distance from centre of reinforcement to neutral axis in inches = $\frac{15a + bd^2}{30 + 2bd}$

a = area of metal in square inches, b = breadth of beam in inches, F = ultimate tensile strength of steel = say 30 tons per sq. in.,

$$y = \frac{15 \times 1'5 + 9'5 \times 8^2}{30 + 2 \times 9'5 \times 8} = 2'75. R = \frac{3}{8}(8 -$$

$2'75) + 2'75 \times 1'5 \times 30 = \text{say } 27'135$ ton-ins., and allowing a factor of safety of 4 = 6'784 tons-ins. safe moment of resistance. The bending moment M = moment of resistance R .

$$M = \frac{WL}{8} = \frac{5 \times 7'75}{8} = 4'84 \text{ ton-ft.} = 58 \text{ ton-ins.,}$$

so that the beam will have a little excess of strength. For the other pair of lintels, with spans respectively of 6ft. 8ins. and 4ft., placed close up under, and with nothing else but the roof to support, proceed in a similar manner. Taking the 6ft. 8ins. case, as in Fig. 3, for the load we have $6\frac{3}{4} \times 10 \times \frac{1}{2}$ cwt. = 33½ cwt., say 1'7 tons distributed; then $\frac{WL}{8d} = \frac{1'7 \times 6'6}{8 \times 2'5} = \text{say } 5'7$ tons tension in steel and compression in concrete, shown by the shaded parabola in Fig. 4. Area of steel = $\frac{9'5 \times 6}{60} = '95$, say 1 sq. in. at $7\frac{1}{2}$ tons per sq. in. = 7'5 tons against 5'7 tons actual stress. Area of shaded parabola $\frac{3}{8} \times 9'5 \times 5 = \text{say } 32$ sq. ins. at 500 lbs. per sq. in. = 7'14 tons safe compressive stress on concrete. The 4ft. lintel may also be made of the same section, as all the beams should be of a suitable depth to bond with the courses of brickwork, i.e., a multiple of 3ins. Checking the

REINFORCED CONCRETE LINTELS.

last calculations by the Trussed Concrete Co.'s formula, y will be found to be 1'5ins., then $R = \frac{3}{8}(d - y) + y; aF = \frac{3}{8}(5 - 1'5) + 1'5 \times 1 \times 30 = 11'1$ ton-ins., and allowing the same factor of safety of 4 we have $\frac{11'1}{4} = 2'775$ ton-ins. Then, as before,

$$M = R, M = \frac{WL}{8} = \frac{1'7 \times 6'6}{8} = 1'417 \text{ ton-ft.} \times$$

12 = say 17 ton-ins., so that the lintel will be easily strong enough. As the loads allowed for are the maximum, assuming that the brickwork is imperfectly bonded, the rods might be reduced in size to, say, $\frac{3}{8}$ in. diameter in the first case, Fig. 2, and to, say, $\frac{1}{2}$ in. diameter in Fig. 4. The portions shown dotted in Figs. 2 and 4 may be moulded on to the lintels to form recess for window heads.

HENRY ADAMS.

Drainage from Stable and Washing Yard.

BIRMINGHAM.—F. W. H. writes: "The drainage from a three-stall stable and water from washing yard have to be dealt with by means of a septic tank; also a small amount of rain and surface water. What size should the septic tank be, and how far away from the building?"

A septic tank in the opinion of most authorities should be constructed to contain twenty-four hours' flow. The farther away

the better, but much depends on the situation, whether near the house or not; say 100 yds. Stable sewage is strong in ammonia, so that it is well to keep it dilute—or the septic action may be impaired.

Stress Diagram for Roof Truss.

FAREHAM.—STUDENT writes: "Please give a stress diagram for the wrought-iron roof truss shown by the accompanying drawing. I want a diagram showing particularly how the total reactions due to wind-pressure and weight of roof, on both supports, and the directions of same, are determined. The weight on the roof is 40 lbs. per sq. ft., the wind-pressure from left side normal to roof 30 lbs. per sq. ft., and the span 40ft."

The frame diagram of proposed truss is shown in Fig. 1. The corresponding stress diagram (Fig. 2) is constructed in the usual manner. Point 9, Fig. 2, found by the funicular polygon, divides the total reaction into the portions acting on each side according to the direction of the wind, and the inclined reactions may either be taken as given or resolved into the horizontal and vertical direction, as shown in connection with Fig. 1.

HENRY ADAMS.

Diverting Underground Springs.

GLOUCESTERSHIRE.—M. writes: "A built his house in 1901, and obtained a good supply of spring water, which was found under the public path and conveyed to an underground tank. B has allowed C to supply his house with water by means of an underground tank, and has diverted the water from flowing into A's tank; consequently A is now without water. What remedy has A against B for interfering with his supply? Can B legally cut off A's supply? B's intention is to make A pay for his supply. Sketch sent (not reproduced)."

The dates respectively when "A" built his house and when "B" diverted the water have no bearing upon the case. The law recognizes "no property in subterranean water," and therefore, if this is "underground water," "A" has no legal remedy in reference to the interference with his supply. On the other hand, if the "spring" consists of water naturally flowing in a well-

defined channel, "A," being the owner below "B," can demand that the flow be continued to him without any material diminishment. There appears to be nothing to prevent "A" from sinking a well on his own property at a point close to the footpath, and in such a position as to tap the supply before it reaches "C's" tank! F. S. I.

Design for Lattice Girder.

GLASGOW.—C. E. M. writes: "Kindly give all dimensions for a lattice girder to carry a distributed load on the bottom flange

of 30 tons on a 45ft. span. I have worked it out by graphic methods, but would like to have it checked by your expert."

Assuming the frame diagram of the lattice girder to be as Fig. 1, the stress diagram will be as Fig. 2 and the nature of the stresses and the approximate scantlings as in Fig. 3. The joints will have to be very carefully designed in order to ensure uniformity of strength with the other parts. The subject should be properly studied from such a work as "The Practical Designing of Structural Ironwork" (Spon, 8s. 6d.), in which, among other things, a small lattice girder bridge is fully worked out.

HENRY ADAMS.

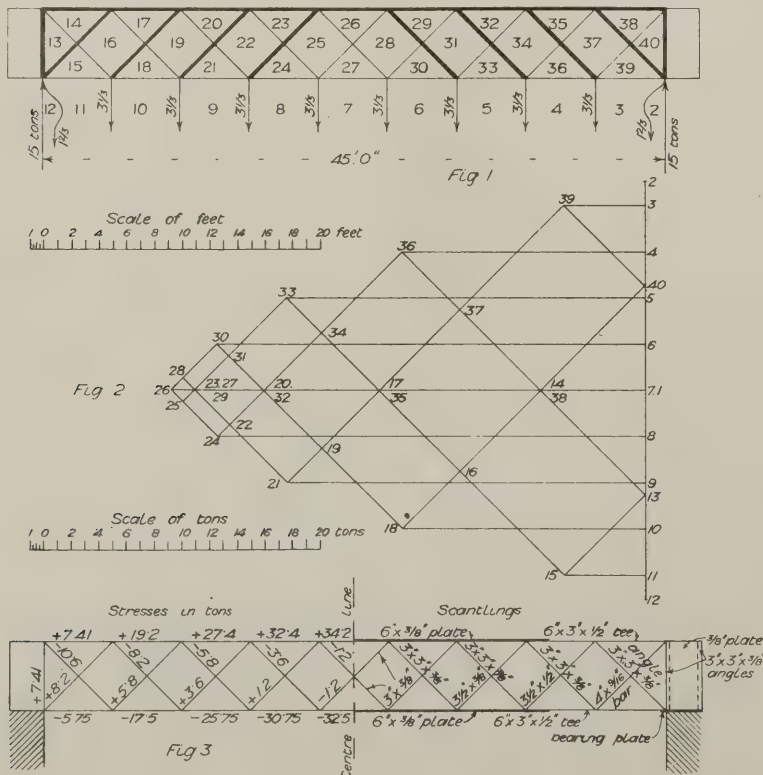

Damp Walls and Wall Paintings.

WORKING.—A. A. M. writes: "In a house more than 200 years old to which I am making various additions and alterations the staircase walls are painted with mythological subjects, the work being attributed to Sir Godfrey Kneller or his pupils. In certain atmospheric conditions the walls run with moisture. There is no sign of damp affecting any other parts of the hall or anything in the hall; there are plenty of openings, and there is no lack of ventilation. What do you think is the cause of the trouble and what can I do to cure it? The paintings have apparently at some time been varnished, and the plaster being now rather uneven, parts are dull and other parts bright. The dull parts seem to be covered with some substance resembling mildew but it will not come off, although it has often been washed. This may of course be due to dust having settled on some of the parts when sticky, but while under my supervision it has always had a perfectly hard surface. If you can account for the wet running down the walls I shall be glad."

The walls affected are probably external, and being colder than the contained air condense moisture; varnish is notably cold. The remedy would be to keep the staircase air cold; or to insulate the walls by erecting a 4½ in. skin to form a cavity wall, or plastering on battens.

STRESS DIAGRAM FOR ROOF TRUSS.

DESIGN FOR LATTICE GIRDER.

THE TIMBER TRADE.

London Market in September.

A SATISFACTORY feature of the London timber trade during September was the increased overside deliveries, amounting to about 4,000 standards of sawn and prepared wood. The deliveries from the docks were practically the same, but compare with very small figures for 1904. The nett result of three-fourths of the year's trading is that there is a reduction in the whole consumption of about 1,400 standards compared with last year, 19,000 standards compared with 1903 and 32,000 with 1902; and Messrs. Churchill & Sim infer that the demand has at length touched its lowest point, the state of the general business of the country seeming to support this view. Considerable quantities of Russian and Swedish stock were placed during the month, and coast buyers have been encouraged to come into the market by more inland activity. London practically confined itself to the importation of prepared boards, which have been sold freely from Sweden. Prices have been quite steady at the lower levels established in the summer, especially for deals. Freighters are more difficult to arrange, and the tendency is towards rather higher rates for late autumn loading.

Messrs. Denny, Mott & Dickson, Ltd., state that the general tone of business during September was good; the volume of trade improved, and a confident feeling as to the future continues to gain ground. The subsidence of the world-wide political disquiet has tended to brighten trade prospects generally; but the still more practical fact of the drastic cutting down of over-commitments which has marked the trading of recent years is now creating a wholesome demand in most directions with a view to supplementing unduly bare stocks.

The abstract of dock stock, consumption, &c., for September, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on September 30th was—

	Pieces.
Foreign deals and ends - - -	1,755,000
Do. battens - - -	2,748,000
Pine deals and battens - - -	1,003,000
Spruce do. do. - - -	798,000
Boards, rough - - -	4,085,000
Do. prepared - - -	7,501,000

Totalling 17,890,000 pieces, as compared with 19,365,000 for 1904, 20,546,000 for 1903, and 23,475,000 for 1902.

In other kinds the stock was as follows:—

Foreign wainscot logs - - -	173 pieces.
Do. oak timber - - -	680 loads.
Do. fir timber - - -	1,189 do.
Do. Oregon pine, &c., spars and masts - - -	4,056 do.
Colonial oak timber - - -	1,456 do.
Do. birch timber and planks - - -	6,451 do.
Do. elm and ash timber - - -	775 do.
Do. yellow pine - - -	694 do.
Do. red pine - - -	94 do.
United States pitch-pine timber - - -	13,524 do.
Do. do. deals - - -	54,000 pieces.
East India teak - - -	7,331 loads.

The deliveries for the first nine months have been of—

	Pieces.
Foreign deals and ends - - -	2,347,000
Do. battens - - -	4,350,000
Pine deals and battens - - -	782,000
Spruce do. do. - - -	1,056,000
Boards, rough - - -	3,975,000
Do. prepared - - -	11,302,000

Totalling 23,812,000 pieces, as compared with 25,761,000 for 1904, 27,636,000 for 1903, and 29,078,000 for 1902.

The deliveries for September have been of—

	Pieces.
Foreign deals and ends - - -	276,000
Do. battens - - -	470,000
Pine deals and battens - - -	76,000
Spruce do. do. - - -	82,000
Boards, rough - - -	378,000
Do. prepared - - -	1,181,000

Totalling 2,465,000 pieces, as compared with 2,545,000 for 1904, 2,825,000 for 1903, and 3,284,000 for 1902.

Deliveries from Ship to Craft.

The deliveries direct from ship to craft for the first nine months of the year have been:—

	P.s.h.	1904.	1903.	1902.
Deals and battens	92,392	84,963	88,850	87,907
Boards - - -	19,725	15,056	19,087	18,648

Total - 112,117 100,019 107,937 105,555 and for September—

	P.s.h.	P.s.h.	P.s.h.	P.s.h.
Deals and battens	13,377	10,528	13,486	14,516
Boards - - -	2,940	1,491	2,196	1,783
Total	16,317	12,019	15,682	16,299

Soft Woods.

Swedish Deals and Battens.—Messrs. Churchill & Sim report that the shipments from Sweden to London of battens and prepared boards especially were rather heavier in September. A large business was done in the latter at prices which showed some improvement, perhaps just enough to cover the extra freight and insurance. Battens continue to be short in stock, and are quite firm at the fullest August prices, but deals are not wanted at present, and there is no inclination to add to the stock, short though it is.

Norwegian Boards.—From Norway a moderate importation kept prices steady with a tendency here and there to improve. The demand has been a little better, and shippers are looking for higher prices for late autumn and winter shipments.

Russian Deals.—The September arrivals from the White Sea were on a very small scale, and the large business transacted in Russian deals during the month was confined entirely to the outports; London merchants have not taken any great interest in shippers' autumn stocks, although they have been offered at tempting prices. The coast importers, on the other hand, came forward freely and absorbed most of what was offered to supply the inland demand, which shows some sign of expanding at last. The state of the London demand for deal sizes is best indicated by the fact that the stock is the smallest held for many years, and yet Messrs. Churchill & Sim say deals are perhaps the worst market they have.

Finnish Battens.—A fair demand met the September importation, which was an average one, and prices were fully equal to the August level. The current sizes in Finland being to a great extent those most wanted here, merchants have been turning their attention mainly to this source of supply. Deals have been offered freely, and some low prices have been accepted for large lines to the outports. Scantlings, especially in redwood, have done well, and whitewood is firm in sympathy with a shortage of stock in most producing countries.

Prussian Timber.—One or two small parcels of fir timber arrived from Prussia to fulfil contracts, but there was no free market. Oak has been selling more freely, and the stock is now very small.

Canadian Timber.—A moderate importation of pine deals from Canada has sent the dock stock up a little, but the demand has almost entirely fallen upon the lower qualities. The very high prices of the better grades of deals have militated against any active consumption, and the trade is still slow and unremunerative. There is a much better feeling in the spruce market in common with competing whitewood from other sources of production. The stock is small, and the only barrier to a larger business is the firm attitude of the shippers, who are trying to educate buyers to a better appreciation of the probable value of spruce in the near future. There is no doubt that stocks are low, both on this side and on the other. Two small shipments of sawn pitch-pine timber arrived during the month to refresh the reduced stock. The demand was better, and, with the very high prices asked for fresh supplies, a good market seems to be assured for the present. The large shipments to the River Plate and elsewhere have left shippers independent of the European demand to some extent, unless at prices which are higher than those ruling in markets where sawn timber is principally used. Deals have been selling rather more freely, but the low prices of North Europe supplies tend to check any decided move upward.

Hardwoods.

Teak.—Messrs. Denny, Mott & Dickson, Ltd., state that the landings in the docks in London during September consisted of 675 loads of logs and 304 loads of planks and scantlings, or a total of 979 loads, as against 526 loads for the corresponding month of last year. The deliveries into consumption were 891 loads of logs and 305 loads of planks and scantlings—together 1,196 loads, as against 478 loads for September, 1904.

This improved demand for consumption serves to show that consumers, who have naturally been holding back from purchasing teak at an unprecedented high cost, are recognizing that the increase in price has been legitimately caused by the shortage of supplies in India; and as this shortage promises to last at least all next year, the position of belated buyers will grow worse rather than better. As the realization of this fact develops, a large demand will probably mark the closing quarter of the year, and landed stocks will probably be unhealthy exhausted by the opening of the new year.

Mahogany.—This market has developed a better tone. In the face of light imports, auction prices have been satisfactory. A larger volume of supply of first-class descriptions of mahogany would be welcomed. Messrs. C. Leary & Co. observe that the outlook continues to be encouraging; the demand is maintained and the arrivals have been by no means excessive. Only one auction was held during the month, and the results were satisfactory.

Odessa Oak.—This market is inactive, owing to the exhaustion of the present season's stocks; but the enquiries for next season's outget promise a good business in

ABSTRACT OF STOCK, CONSUMPTION, &c., FOR SEPTEMBER.

S.C. Dks. and M. Dks.	Deals (Fir).	Battens (Fir).	Pine.	Spruce.	Pitch-pine Deals.	Deals and Battens in Aggregate.	Rough Boards (All Countries).	Flooring.	Floated Timber.
	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.	Loads.

this wood for next year, as it has found increasing favour with consumers as a reliable and valuable oak when shipped with proper care and judgment.

LIVERPOOL TIMBER TRADE.

(By Our Special Correspondent.)

MORE activity was noticeable in the Liverpool timber market during September. This has been largely due to the more settled condition of trade in the towns of Lancashire and Cheshire since the holiday season came to an end. Building operations in these towns are now in full progress, and a very fair demand for light and heavy building timber has been experienced from them. In the Liverpool district, also, there has been a better demand for joists, scantlings and flooring boards for residential housework. Some big jobs in the district are making demands for rough timber, and will shortly require sawn and manufactured material. Work at the new cathedral has reached the stage at which a large amount of strong timber for staging and scaffolding is wanted. The new central tramways' offices in Hatton Garden have reached the same stage; and an extensive office-building job in Old Hall Street is nearing a similar condition. In the Kensington, Fairfield and Knotty Ash districts residential house building is now proceeding more briskly, and more timber is being taken for this class of work. Along the line of docks the new works are proceeding rapidly and much heavy timber is being used.

At the last meeting of the Dock Board recommendations by the Works Committee that certain sidings be laid down on the east side of Brunswick Dock at an estimated cost of £1,600, and that a single storey shed be constructed on the west side of Brocklebank Dock, with the necessary roadway, at a total estimated cost of £29,200, were adopted. The demand for timber on dock works' account is therefore likely to be maintained for some time to come.

Deals and Pines.

Spruce deals have come to hand in quantities which would have well sufficed to meet requirements. But one has only to survey the Derby Road stocks to see that the supplies of this timber are more than abundant and that there is no likelihood of any shortage for some time to come. More interest, however, has been shown in spruce, and the tone of the market has improved. The eagerness to buy was very noticeable at the spruce auction sales held on September 20th and 21st. At the first of these, Messrs. A. F. & O. Mackay's sale, nearly the whole of the deals, scantlings and boards offered found purchasers at fair prices. As an indication of values it may be mentioned that deals of 9ft. and upwards, and 3ins. by 8ins., brought £7 12s. 6d., and 3ins. by 11ins. £9; while fourth-quality deals brought £6 15s., spruce boards £6 10s., scantlings £6 12s. 6d. for 3ins. by 5ins. and £6 17s. 6d. for 3ins. by 6ins.

On September 21st, at Messrs. Alfred Dobell & Co.'s sales, the hardening of freights and the probable advance in prices consequent thereon were cited as reasons for liberal buying: 3in. by 6in. spruce deals were sold at £6 12s. 6d., and 3in. by 12in. £7 10s. Scantlings, 2½in. by 6ins., £6 15s., and 3in. by 5in. £6 10s.

A fair demand for flooring boards has been experienced, as local requirements for these boards have been greater on account of building work. Supplies have, however, come to hand which have about replaced the quantities withdrawn. Prices continue to harden, the talk of higher freights also affecting this timber.

Arrivals of pitch-pine have been light, but stocks of all kinds are much in excess of any likely demand. Sawn wood has met

with fair enquiry; and a considerable shortage in the receipts for the year, as compared with last year—and still more with 1903—is shown by the returns.

There is evidently a large and steady consumption of sawn pine inland, but without fresh supplies the stocks would serve for fully three months on the basis of recent requirements.

Mahogany.

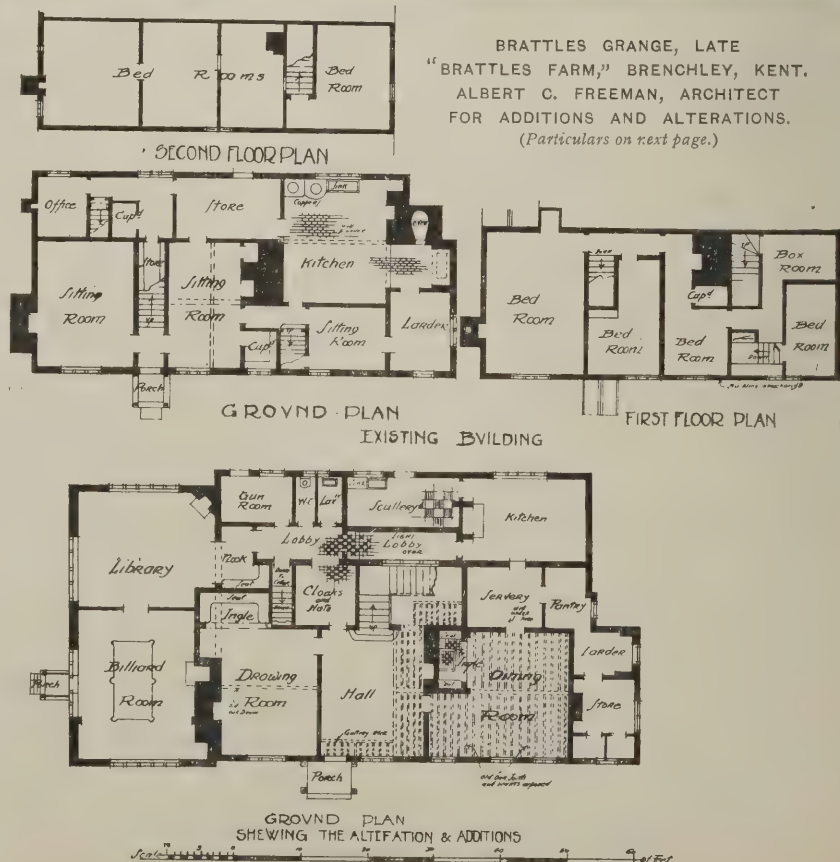

The demand for mahogany, in view of cabinet-makers' Christmas season requirements, has been more active, and more interest has been shown generally in this wood. Arrivals have been but moderate in quantity. Three auction sales were held in the course of the month, and stocks of high-class wood found ready buyers. With respect to business actually done, a consignment of Laguna wood offered by Messrs. Farnworth & Jardine proved of much interest, and bids for most of the lots were made freely. Some lots were passed at the first offering, but on

being offered a second time later, to clear, were sold at 3d. per foot. The price obtained for the whole consignment worked out at 31½d. per foot. Square cedar offered at this sale realized 4½d. and 5d. per foot.

On the following day Messrs. Alfred Dobell & Co. offered a considerable aggregate stock of mahogany of different kinds. Generally wood of quality excited interest and sold at a good price. Mexican, Colombian and Honduras wood has been practically out of stock.

Oak.

This wood, in miscellaneous lots, came to hand freely through the month. Of the consignments, planks received by Mr. A. Kershaw, strips and bundles by Messrs. James Kennedy & Co., Ltd., and strips and inch boards by Messrs. Lyle & Pollock, have been among the more important. Oak lumber has been received to a considerable quantity in the aggregate. Planks keep in very short supply, the receipts for the year up to date being

OF THE
UNIVERSITY OF ILLINOIS

greatly below the receipts of each of the last two years.

Teak.

Further receipts of this wood have increased stocks. These are now large, the consumption of late being comparatively light.

Walnut.

This wood, in logs and lumber, has been received in fair quantities. The demand, in view of winter requirements, has been rather better, but as stocks are abundant, prices continue low.

Manufactured Goods.

A number of consignments of manufactured goods came to hand through the month. Among these were a consignment of 1,700 doors, received by Mr. John J. Swan; a consignment of dowels by Lytle & Pollock; woodware by Alfred Dobell & Co., Ltd.; and sundry consignments of handles, &c., by different firms.

At the mills, sawing has been active, the freer movement of builders' timber, locally and inland, having made more work. The cartage of timber to the Derby road stations for transport inland has also been more active, testifying to the improved demand for timber for building purposes.

OUR PLATE.

THIS architectural scheme by Mr. C. H. Reilly (who is the Professor of Architecture at the University of Liverpool) was prepared for a certain island site in Liverpool as a building to be devoted to the Faculties of Arts and Fine Arts. The quieter portion of the site in the rear is occupied by the Library Block, the various divisions of which form seminar rooms for teaching and study, contiguity in plan representing kindred subjects, *e.g.*, the rooms for the different languages being roughly in the same relation to each other as those languages. The northern end of the building, on account of light, is designed for schools of architecture, painting and sculpture. The main feature of the design is (in the opinion of the architect) the long internal courtyard ending in the symmetrical domes, here illustrated. The top floor is for museums and the basement largely for the School of Education, with practising rooms. The Senate Room and the Main Theatre are on the first floor. The recessed loggia is to cloak the number of storeys of windows necessitated by the confined site. The drawings were hung in this year's Royal Academy Exhibition.

BRATTLES GRANGE.

THE plans on the opposite page show the alterations and additions carried out to convert what was known as "Brattles Farm" into a residence for Mr. T. Hay-Edwards. The building, which is one of the many sixteenth-century farms to be found in Kent, has been reconstructed with as little alteration as possible to the existing front, the annexe being designed to match the other work in every detail; the outside timbering is of old oak obtained from the demolished farm buildings. The new walls are faced with old red bricks, and the roofs are covered with old tiles, some of which bear the following inscription, burnt in: "Samuel Harman, May.12.1748." The plaster to the ceilings of the hall and dining-room of the house has been stripped, and the beams and joists (of oak) have been cleaned and left exposed. The old fireplace in the centre of the building was with some considerable difficulty reconstructed to form an open fireplace in the hall, and an inglenook was arranged in the dining-room. The work, which was carried out last year from the designs of Mr. Albert C. Freeman, architect, of London, was executed by local builders upon a scale of charges, it having been found impossible to fix a contract owing to the great amount of unseen work. Mr. J. H. Walker acted as clerk of works.

THE NEW POST-OFFICE BUILDING TO BE ERECTED IN NEWGATE STREET, LONDON.

SIR HENRY TANNER, ARCHITECT.

Views and Reviews.

Engineering Mechanics.

This book on mechanics, written essentially for engineers, is truly a remarkable achievement by Professor Goodman. It is distinctly the clearest and most serviceable of all the books on the subject that we have yet seen. It is of course not so elaborate as some works, but it contains an immense amount of information all conveyed in the shortest and most intelligible way. It fully deserves its success in having reached a fourth edition and a numerous and wide circulation abroad. The fact that it is used largely in the United States shows its sterling qualities. Students are assumed to have a fair knowledge of elementary mathematics and theoretical mechanics, and the book is intended to assist them to apply their knowledge to practical engineering problems. The calculus has been introduced sparingly. There are many illustrations in the book which serve to increase its clearness. A good feature is the table of annotated and explained data on mensuration of figures, centres of gravity, moments, inertia, &c. The author is distinguished by his acquaintanceship with practical difficulties, which he has endeavoured to meet; most authors of books on applied mechanics have been theorists who, while delighting in abstruse mathematical explanations of small matters, have neglected to deal with the many difficulties experienced in practice. Thus this is one of the few books which deal with eccentric loading of struts and with wind-pressure on awkward-shaped roof trusses. We would still like to see the calculation of members in curved roof-trusses dealt with. The book treats of many branches of engineering, such as mechanisms, the steam engine, beams, struts, structures, hydraulics, hydraulic motors and machines, and pumps, but we think architectural students would be all the better for a thorough study of this book.

"Mechanics applied to Engineering," by John Goodman, Wh. Sch., M.I.C.E., M.I.M.E., Professor of Engineering in the University of Leeds. London: Longmans, Green & Co., 39, Paternoster Row, E.C., price 9s. nett.

THE NEW POST-OFFICE BUILDING.

ON Monday the King laid the foundation-stone of the new post-office building which is to be erected on two-thirds of the site of Christ's Hospital (the Bluecoat School, now removed to Horsham, in Sussex). We illustrate the design above. This has been prepared in the Office of Works under the direction of Sir Henry Tanner. The building will contain the main sorting office for those letters now dealt with in the old Post Office at St. Martin's-le-Grand, and it seems doubtful what will be done with Smirke's building.

R.I.B.A. NEWCASTLE VISIT.

ON Thursday last in the Assembly Rooms, Newcastle, the mayor and mayoress (Alderman and Mrs. J. Baxter Ellis) accorded a formal reception to members of the Royal Institute of British Architects.

On Friday the annual dinner of the Institute was held (Mr. John Belcher, A.R.A., presiding). In giving the toast of the evening the Duke of Northumberland, speaking for the allied societies, offered the Institute a hearty welcome to the North-country, while speaking for the Institute he should say that the local associations were a matter of great interest to it; and it was by the strengthening of those local associations that the real work of the Institute was carried out. Turning to the position of architecture to-day, he said he did not think any young architect could hope to do very much better, say, in ecclesiastical architecture than the people of 500 years ago, and as for the fine old manor houses—well, they might give them fewer steps to go up and down than there were in these manor-houses, and he did not doubt that their sanitary arrangements might be better, but he very much doubted whether they would give us anything which was more picturesque or more thoroughly English. The young architect, when he reflected in that way, might be a little bit discouraged, but if he would go further he would find that there was a great field for his ingenuity

and his study, even in this matter-of-fact twentieth century—more especially in the matter of public buildings and the erection of houses for the working classes: and finally the opening which was offered by the zeal of the Board of Education. He suggested that members of the Institute and those whom they trained might very well devote a great part of their attention to assisting local bodies in the effort to meet the requirements of the Board of Education at some reasonable rate, without the necessity of covering the landscape with horrible structures such as they sometimes saw.

Programme for the Next Session.

The following is the programme of the Royal Institute of British Architects for the forthcoming session:—

- Nov. 6.—President's opening address.
- Nov. 20.—Mr. R. A. Denell, of the Waring-White Building Co., Ltd., on "American Methods of Erecting Buildings."
- Dec. 4.—Business meeting.
- Dec. 18.—Mr. Alexander Gascoyne and Mr. A. J. Dix on "Stained Glass."
- Jan. 8, 1906.—Business meeting.
- Jan. 22.—Mr. John M. Swan, R.A., Mr. Montague Fordham and Mr. Walter Gilbert on "Metalwork." Award of prizes and studentships.
- Feb. 5.—President's address to students. Presentation of prizes.
- Feb. 19.—Mr. E. Guy Dawber on "Furniture."
- Mar. 5.—Business meeting. Election of Royal Gold Medallist.
- Mar. 19.—Paper (subject to be announced).
- April 2.—Mr. W. Aumonier and Mr. A. W. Martyn on "Woodcarving."
- April 23.—Mr. G. P. Bankart and Mr. Lawrence A. Turner on "Plasterwork."
- May 7.—Annual general meeting.
- May 21.—Mr. Paul Waterhouse on "The London Traffic Commission Report."
- June 11.—Business: annual elections.
- June 25.—Presentation of Royal Gold Medal.
- July 16 to 21.—Seventh International Congress of Architects, London.

TIN ROOFING.

IN America tin roofing has been extensively employed in past years, though latterly a number of other materials, new and old, have come into favour; but there are still multitudinous examples to show that tin roofing has withstood the weather for more than half a century and remains good to-day. There are instances where terne plates have been known to last on a roof 100 years, but they were of iron, not steel; there is a church in Vermont whose steeple was covered with iron plates coated with pure tin in 1816, and it had never been painted up to 1903—87 years on a roof. A paper on this subject was read recently before the National Association of Master Sheet-metal Workers at Milwaukee, in the course of which the author, Mr. William Martin, made some useful remarks about the fixing of tin roofs. He said:—

“The modern way of nailing a flat-seam roof is one of the worst enemies of a tin roof, for every nail you put through the plate itself invites a leak, and it is a matter of surprise that the largest manufactory of terne plate in the world should advocate this very system in its book, ‘A Fifty-Year Roof.’ By this system you nail the sheet direct to the

Roof board, using $\frac{3}{4}$ in. or 1 in. wire nails, five or seven to a sheet, three or four on the long seams, two or three on the short seams. Then the seam is hammered down over the nails, covering them up—or is supposed to do so; but as the seam is barely over $\frac{3}{4}$ in., even if carefully put

in, the edge of the nail is only $\frac{1}{16}$ in. from the edge of the seam. In soldering-off the solder runs round the nail head, not over it, for it cannot; and in five or seven places in the seam you have a covering of only $\frac{1}{16}$ in. In nine cases out of ten you will find the leaks near these nail heads. This is a cheap way, but one of the worst which can possibly be adopted.

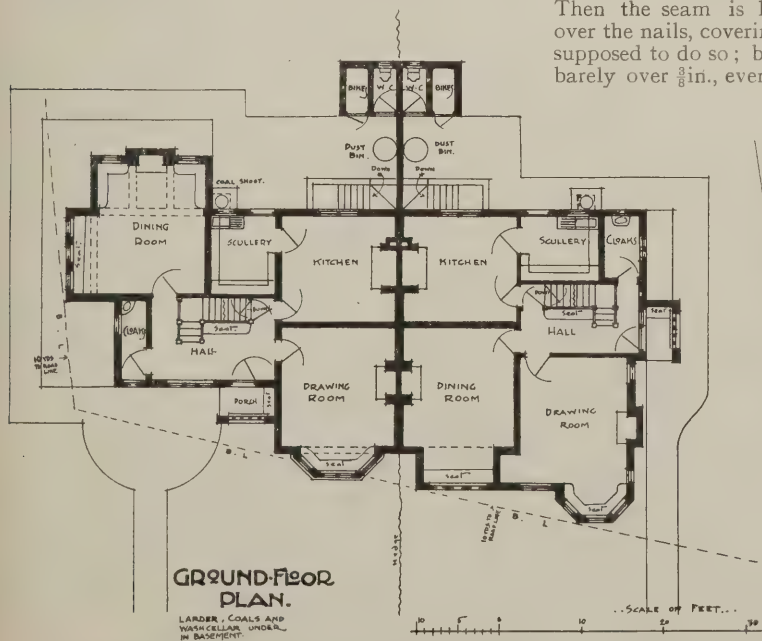

How a Tin Roof should be put on.

“There is only one way to put on a tin roof—that is, cleating for both flat and standing seams. If put on in sheets, three $\frac{1}{4}$ in. or 2 in. cleats to the cross seams and five on the long seams on every 14×20 sheet; if put on in rolls, a cleat every 4 ins. or 5 ins. By this method, when the seams are flattened down and the roof soldered off and the seams well soaked, you have practically a solid sheet of tin for a roof. Every seam is as good a sheet, if not better, and not a nail-hole on its entire surface, as the nails are put through the cleat, not through the plate. All expansion and contraction is taken care of, with no buckling of the sheet.

“The above are undoubtedly the main

causes of the decadence of terne plates as a roof covering, and until a satisfactory permanent remedy is found and the good old-time methods of putting on the plates are adopted, the material will continue to be passed by and neglected as a roof covering.”

HOUSES IN LEICESTER ROAD, HALE, ALTRINCHAM.

JOHN COCKER, ARCHITECT.

These houses are built of local bricks with grey mortar joints, the base being of pressed stock bricks. Runcorn stone is introduced in places, the gables are plastered, and the roof is of grey slates. The architect is Mr. John Cocker, of Altrincham.

STRENGTH OF BRICKWORK.

THE week before last we announced that the Royal Institute of British Architects had re-issued in volume form* the report on brickwork tests conducted by a sub-committee of the Science Standing Committee in 1895-7, and in now reviewing the book we have collected into table form, for comparison, the results of all the various recorded tests of any value.

The strength of brick piers is of importance, and the information that has been obtained from the tests by the Royal Institute of British Architects and by the United States Government at the Watertown Arsenal are distinctly valuable, but it must be confessed that all these tests do not satisfactorily settle the question. Much further investigation is necessary before any adequate theory can be arrived at. The tests, both in this country and in America, have not been carried out in a thoroughly scientific manner. The piers have been built in a haphazard way by ordinary workmen, the bonding has been imperfect, the mortar evidently has not been always exactly according to formula, and the time and subjection to weather have not been the same; hence there can only be the roughest comparison. It is true the test piers have been built in the haphazard way that might be expected in ordinary practice, but it is impossible to discover any theoretical law by such means; although such tests will be valuable enough when the theory of the stresses in brick piers has been worked out, as affording a basis for the factor of safety to be allowed in practice and for by-laws. It is the duty of the Royal Institute, as the representative body of architects in this country, to bring the present chaotic state of knowledge of construction into some order and to elicit scientific data about important details where no data exist. In this respect the Institute has been sadly lacking. The Institutions of Civil and Mechanical Engineers and other professional bodies have carried out many

experimental tests, and the Institute cuts a sorry figure beside them. The strength of walls and piers is of primary importance to architects, and further series of tests are wanted. As the matter also largely affects engineers, we think the R.I.B.A. should have the co-operation of the Institution of Civil Engineers.

The tests in 1895-6 were in three series—the first and second to show the strength of 18in. piers at three months and six months respectively, and the third including short lengths of wall. A powerful hydraulic press, together with a specially designed frame, were contributed by Sir William Arrol for the experiments. This press allowed piers 6ft. high to be tested. The short walls were practically only piers measuring 27ins. by 18ins. It will be seen that the height was less than for a pier generally required in practice, and the American tests on piers up to 10ft. show that the difference of 4ft. is considerable; 10ft. appears to be as little as should be tested, being about the minimum height for a pier in practice. The size of the piers, namely 18ins., was reasonable, as smaller piers are seldom required and would be inadvisable, though the American tests were mostly on piers 8ins. and 12ins. square. The bonding was the ordinary one, each course having on two faces stretchers and on the other faces three headers and two closers, joints in alternate courses crossing. The plan

of each course was thus: This was a faulty bond, in permitting a small vertical joint 2½ins. by 2½ins. throughout the height of the pier in each of the angles, which proved generally to be the point of failure.

The piers were built by a large firm of contractors at day-work prices; and the bricklayers, finding the Leicester red and the Staffordshire blue bricks very hard to cut, filled in a great portion of some piers with closers of London stocks, which destroyed the value of the piers for experimental purposes. Fresh piers were built and tested, and these piers, having been built under the careful supervision of a clerk of

works, were of such superior workmanship that the results were higher with lime-mortar than those of the earlier tests with cement; they have therefore been omitted from our table as exceptional and not likely to be obtained in ordinary practice. This fact and the illogical character of some of the results show the influence of workmanship and clearly prove the uselessness of these tests for the scientific determination of theoretical laws.

The sand used for the mortar was Thames sand sifted and washed, and better quality than usual in practice. The lime was grey stone lime unground, slaked and made up by hand. The cement was Portland. The mortars were subjected to chemical analysis, but this proves nothing as to their strength, because in some cases results seem to show that cement-mortar was worked up after setting, and this suggests the differences that might be caused by temperature and the amount of water used in mixing which were not recorded.

The bricks were of five kinds, as shown, and in testing the hardest ones for crushing the machine was not powerful enough to take whole ones, so that half ones were used, and they proved to be about 25 per cent. weaker than whole bricks. This we have added in computing the crushing strength in the table.

The effect of the strength of the mortar upon the tests is apparent, and it was noticeable that the first signs of failure were usually in the mortar joints in the piers built with lime, and in the bricks in those built with cement.

In the theory of the strength of struts and pillars the coefficient of elasticity is important, but this was not ascertained in regard to the materials; in fact, in regard to bricks we can find no record of tests for this anywhere. The amount of compression of the piers was taken, however, but varied so considerably, due to differences in the conditions of construction, that little or nothing can be learnt therefrom.

The tests on short walls were impractical. The report says in reference to them: "The influence of form upon strength has to be considered, but under the ordinary or average

Strength of Solid Piers.—(Averages.)

* London: R.I.B.A., 9, Conduit Street, Hanover Square, W., price 6s.

conditions of practice the form of brickwork does not appear very greatly to affect the strength, the 18in. piers having given approximately similar results per square foot to those obtained from specimens 27ins. by 18ins., and in a building of any considerable height the total height may generally be considered as divided by each floor. Otherwise the effect of shearing or a bending strain, however introduced, would be fatal to any walls of great height and length." The results were not approximately the same: the bonding was superior in the "walls," and this doubtless accounts for their superior strength (in the case of the blue bricks the walls were built from stronger bricks than the piers), but we have no right on such slender evidence to draw conclusions as to the strength of a wall of even short length.

We think it most important that further tests should be carried out. The by-laws as to the thickness of walls have been drawn up without any scientific basis, and the requirements are sometimes too stringent and sometimes too lax, while they differ in various places. It is of first importance to ascertain the strength of 9in. and 14in. walls, as the majority of walls are of these thicknesses. It would be comparatively easy to test them by erecting brick and stone partition walls, say, 10ft. high between outer walls of considerable thickness, with continuous joists over, resting on another joist as wall-plate on the wall under test, to distribute the load equally, and applying the load by means of pig-iron. Similar walls of 4½ins., 9ins., 13½ins., 18ins. and 22½ins. thickness, and varying in length from 5ft. to 20ft., should be tested; while if piers 9ins., 13½ins. and 18ins. were tested in various kinds of bricks up to 15ft. in height, carefully constructed under equal conditions, we should have a most valuable mass of evidence that ought to conclusively settle the question. Government and municipal authorities ought to assist in such a work.

Builders' Notes.

Employment in the Building Trades continued dull during September. It was on the whole about the same as August, but slightly worse than a year ago.

Sheffield Builders, Ltd.—On p. 151 of our issue for September 13th a paragraph stated that this company was to be wound up. Since its appearance some confusion appears to have been made by readers between the firm named—a Sheffield firm—and the well-known London contractors, Messrs. Sheffield Brothers, Downs Park Road, Dalston, N.E. We are requested, therefore, to draw attention to the matter.

The Restoration of the Proscenium Arch at His Majesty's Theatre for Mr. Beerbohm Tree has been completed by Messrs. Patman & Fotheringham, Ltd., under the supervision of Mr. Romaine Walker, the architect, earlier than anticipated. The work was carried on by night and day. Very good progress is also being made at the Avenue Theatre by Messrs. Patman & Fotheringham, for Mr. Cyril Maude.

To Prevent Strikes.—At a meeting of the Stockton Master-Builders' Association held last week (Mr. T. Hanby presiding) the scheme which had been formulated by the Master-Builders' Federation throughout the country, with the object of preventing strikes, was considered. The scheme provides that in the first instance the masters and operatives shall meet to discuss matters in dispute, and, failing a settlement, the question shall be referred to the local conciliation board. If that was unsuccessful the matter would go forward to the Northern Centre Board and finally to the National Conciliation Board. Whilst negotiations are going on there is to

be no stoppage of work. The scheme was approved by the Stockton Master-Builders, and representatives on the local conciliation board were appointed.

Southern Master-Builders' Federation.—The half-yearly general meeting of the Southern Counties Federation of Master Builders was held at Portsmouth recently, the chair being occupied by the president, Mr. F. Wallis, of Maidstone. Several important matters relating to the building trade were discussed, the chief being questions of forming a national reserve fund, a national conciliation board, and a national organization committee, for the purpose of going thoroughly into questions of finance and organization and into Parliamentary and local government matters. With regard to local building by-laws, the president said he was pleased to state that the National Federation of Building Trade Employers had agreed that the subject of codifying the building laws was important enough to have the consideration of a Royal Commission, and that the matter was receiving attention.

Keystones.

Help wanted for the Architects' Benevolent Society.—Mr. Walter Emden has offered £50 for the Architects' Benevolent Society, provided nine other gentlemen will do likewise.

Kingsway and Aldwych, opened by the King to-day, will both be lighted by high-pressure gas lamps of 700-c.p. Below the surface is the shallow tramway tunnel, to which access is given by short flights of steps at regular intervals, while below the tunnel is the tube of the Great Northern and Piccadilly Railway.

A Striking Application of Fire-resisting Material is well illustrated by the magnificent tapestries from Raphael cartoons which have lately been hung in Hampton Court Palace. These are specially protected from any risks or damage by fire, a special apparatus being attached for quickly lowering them and the backs of the panels being covered with Uralite, supplied by the British Uralite Co., Ltd.

New Library and Fire-Brigade Station at Ilford.—Plans for a public library at Ilford, Essex, have been prepared by Mr. H. Shaw, A.M.I.C.E., surveyor to the U.D.C., and tenders are to be invited. The building will be erected on a site opposite the G. E. R. station, out of a gift of £10,000 by Mr. Andrew Carnegie. The new central fire-brigade station at Ilford is nearing completion, and will be formally opened on November 9th. The estimated total cost is £8,000. The plans for this building also were prepared by Mr. Shaw.

Fire Insurance.—The intricacies of a fire-insurance policy are very little understood, most people being under the impression that they have only to pay the premium in order to be able in the event of a fire to draw the amount insured. But an insurance company will require the insurer to prepare a list of the goods destroyed and to substantiate the claim, which he can seldom do, so that an unsatisfactory compromise usually results. A special insurance valuation of the contents of the house made by some reputable firm offers a remedy, and this Messrs. Gillow, of 406, Oxford Street, London, W., are prepared to undertake, and the reputation they possess guarantees the acceptance of their valuations by the fire offices as a basis of settlement. Messrs. Gillow have recently issued an interesting pamphlet on the subject, entitled "Fire Insurance: its Defects and the Remedy," and they will be pleased to give information free of charge to any who care to communicate with them.

A new Hall for the Parish of St. Mark, West Ham, is being built at a cost of about £2,000 from designs by Mr. Henry A. Saul, architect, of London, W.C. The foundation-stone of the building was laid on Saturday last.

Liverpool Architectural Association.—The annual report of the council for the past session—the 57th—has just been issued. The present membership is given at 120. Standing by-laws necessary for the proper working of the Society, and nomination and other forms, have been published. A travelling studentship in connection with the Society is proposed to be established, and educational and professional practice committees are intended to be formed to take an active part in regard to local competitions and other matters affecting the profession. The syllabus of the present session is as follows:—October 9th, presidential address by Mr. Philip C. Thicknesse; October 23rd, "Opinions on Garden City Cottages," by various members; November 6th, Mr. A. Needham Wilson on "Sketch Plans and Working Drawings"; December 4th, Mr. E. A. Rickards on "Intention in Ornament"; January 8th, Mr. P. Scott Worthington on "The Houses of the Monks in the Middle Ages"; January 22nd, Mr. T. Rees on "Architects and the Improvement of Cities"; February 5th, Mr. C. H. Reilly on "Michael Angelo's Work at San Lorenzo and in the Sistine Chapel"; February 19th, members' meeting; March 5th, Mr. Charles Spooner on "Church Fittings."

Manchester Society of Architects: President's Address.—On Thursday last the first sessional meeting of the Manchester Society of Architects was held. Mr. J. H. Woodhouse, F.R.I.B.A., the newly elected president, in the course of his address, dealt with "new art" in architecture. This he described as a passing phase, a mere caprice of the hour. Its originality frequently became eccentricity, and would not survive the test of time. He contended it was not "new art" that was desired, but a full and thorough knowledge and appreciation of our old art, adapted to modern conditions and requirements. In support of this he quoted Ruskin: "The forms of architecture known are good enough for us and for better than any of us, and it will be time enough to think of changing them for a better when we can use them as they are." In regard to "taste" in architecture, Mr. Woodhouse suggested that in order to secure for the benefit of the citizen a higher ideal in the artistic treatment of Manchester, a small advisory committee should be appointed, formed of men of acknowledged qualification, to whom should be referred all matters of an artistic character. If this were done, he said, we should not mourn in the future as we now do over so many things that offend us. It would have pleased him to see the small plot of land in Victoria Street at the bottom of Cateaton Street retained as an open space. Thereby a public interest would have been secured in the old Hanging Bridge recently brought to light. But it was not to be, and the foundations for new buildings had already been begun. The present strong trend of the architect towards erecting city buildings in permanent coloured material was appreciatively commented upon.

Architectural Classes in Edinburgh.—The Edinburgh Architectural Association has just issued a syllabus of classes on art and technical subjects to be held in Edinburgh this coming session. The attention of practising architects is directed to those classes which their pupils and draughtsmen should attend according to their advancement in knowledge. The syllabus indicates a course of general study extending over four years, leaving a certain amount of latitude in the selection of classes. A recommendation is

subjoined strongly advising students to prepare themselves for the R.I.B.A. examination, and announcing special classes which are to be provided with that object.

The Wesleyan Central Hall at Plumstead—in High Street—was opened recently. The cost has been £21,399.

New Schools have been erected at New Tredegar and Cwmsflog, in the Rhymney Valley, from designs by Messrs. James & Morgan, F.F.R.I.B.A., architects, of Cardiff.

Restoration of Moreton Hall.—A modified form of restoration or repair, following closely on the lines of the original conception, is being carried out at Moreton Old Hall, Cheshire.

New Offices at Falkirk, for the Eastern District Committee of the Stirling County Council, have been erected at a cost of about £6,000 (exclusive of site) from designs by Messrs. A. & W. Black, architects, of Falkirk.

Mr. John T. Henshaw, M.S.A., architect, surveyor and estate agent, has taken over from Mr. Robert Neill the offices of the late Mr. Charles Parsons, at 9, Grimshaw Street, Burnley, and at Blackburn. Mr. Henshaw was formerly manager with the late Mr. Parsons.

Les Architectes en Belgique.—“Le Petit Bleu” publishes the following: “La société centrale d'architecture de Belgique a pris la résolution, dans un but d'intérêt professionnel, d'intérêt général et de propagande d'art, d'adresser à tous les pouvoirs publics une requête les invitant à décider que, dans le ressort de leur département ou juridiction, ‘tous les travaux de construction de quelque importance soient confiés à des architectes privés à désigner par voie de concours public ou restreint, ou choisis en vertu de leur talent notoire ou de leurs aptitudes spéciales.’”

Partnership.—We regret that, through a misreading of the circular sent to us, we made a mistake in the announcement of the partnership between Mr. Lionel G. Detmar, A.R.I.B.A., and Mr. Theo. Gregg at 1a, St. Helen's Place, Bishopsgate Street, E.C. Mr. Detmar was formerly in practice with his uncle, Mr. W. Hilton Nash, F.R.I.B.A., at Bush Lane House, Cannon Street, E.C., and it was on the retirement of his uncle that Mr. Detmar arranged to carry on the practice conjointly with Mr. Gregg. In the paragraph published on p. 198 of our issue for October 4th it was erroneously stated that Mr. Nash, on the retirement of his uncle, had entered into partnership with Mr. Gregg.

The Cost of restoring York Minster.—The “Occasional Papers” which the Dean of York has issued during the past five or six years describing the progress of the work of repair and restoration at the Minster have now been collected together and issued in volume form. It appears that between 1829 and 1899 the following sums were spent on restoration and rebuilding work:—

1829—Rebuilding of choir - - -	55,882
1830—Rebuilding of nave - - -	24,560
1859—Restoration of chapter-house - - -	4,200
Organ-chamber - - -	1,200
Organ nave - - -	1,000
Restoration of south transept - - -	20,000
1890—South window of choir transept - - -	610
1891—Nave roof - - -	1,200
1893—North window of choir transept - - -	572
1896—South aisle of nave pinnacles - - -	1,200
Total - - -	£110,424

In October, 1898, Mr. Bodley reported that another £50,000 would be needed to carry out the essential restoration, and that this would occupy fourteen or fifteen years. The work was undertaken, and has been carried on for five or six years on the lines recommended by Mr. Bodley, though much yet remains to be done. The total amount subscribed towards the restoration fund up to June 17th last was £22,857, and there had been expended £16,238, leaving a balance in hand of £6,619.

Viaduct for Dover.—The Dover Corporation intend to apply to Parliament for an extension of the period granted them to build a viaduct at a cost of £100,000 in connection with the maritime traffic.

Wellingborough Baptist Church has been built at a cost of £2,476 from designs by Messrs. George Baines & Son, 5, Clement's Inn, Strand, London, W.C. The builders were Messrs. E. Brown & Son, of Wellingborough.

Ayr Bridge saved for the Present.—Last week the Ayr Town Council decided to delay operations on the “Auld Brig” for four months, so as to allow the parties interested in its preservation an opportunity of providing the means of restoration and also of satisfying the council that the methods they propose will be such as to ensure permanency.

Serious Dilapidations at Winchester Cathedral.—The shoring-up of the exterior of the east end of Winchester Cathedral is now completed, but the excavations made have disclosed a serious fracture in the walls. This widens as it descends, and it is feared that it extends in a more alarming manner right to the foundations. £20,000 is needed at once for the work.

Milan Exhibition, 1906.—This exhibition is to be opened at Milan on April 15th next. It will be on a large scale and divided into ten sections. Among these will be sections dealing with wallpapers, furniture, lighting and heating apparatus, and sanitary fittings. Full particulars can be obtained from Mr. Arthur Serena, Honorary Executive Commissioner, at the office of the London Chamber of Commerce, Oxford Court, Cannon Street, E.C. The British Government has made a grant of £10,000 towards the exhibition, and it is therefore worthy of the attention of British manufacturers.

The new Chapel at St. Paul's Cathedral—the Chapel of the Order of St. Michael and St. George—was privately opened last week, although not yet completed. It is at the south-western end of the building, where Alfred Stevens's Wellington memorial formerly stood, and has been designed by Mr. Somers Clarke, F.S.A., architect to the Dean and Chapter. Teak stalls and seats for the chapel are being made and carved from the architect's designs by Mr. J. E. Knox, of 31, Upper Kennington Lane. The elaborate ironwork in some of the front seats is given by the Dean and Chapter, and is part of the original wrought work used in the choir of the cathedral. The window has been designed by the architect and made by Messrs. Powell & Sons, of Whitefriars.

“Timber and Brains.”—A paper with this title was read recently by Mr. Henry Adams, M.I.C.E., late professor of engineering at the City of London College, before the British Institute of Certified Carpenters at Carpenters' Hall. The author described the timbers that could be used in wet foundations, and gave examples of durability, followed by those that would best resist a damp situation, and then mentioned examples and exhibited specimens of durability in works above ground. The timbers best suited for marine work and for use in hot countries, to resist the attacks of worms and insects, were also mentioned. The nature of the grain of various woods, as affecting their use, was next referred to, many examples being given. The characteristics of good timber were described, the chief defects named, and the modes of preservation briefly noticed (including the new and promising Powell process). The mode of shrinkage and the alteration of shape produced during seasoning were explained, and how advantage might be taken of this knowledge. Finally, the principles of stress and strain, and the designing of beams, were described, and some useful rules were given.

New Isolation Hospital.—The Mid-Cheshire new joint isolation hospital near Davenham was opened recently. It has cost £12,000 and contains thirty-four beds for scarlet-fever and typhoid patients. This is the first joint hospital built under the compulsory order of the Local Government Board.

A new R.C. Church at Malvern has been built for the Order of Benedictines next to their monastery. It has been erected according to the last designs prepared by the late Mr. Paul Peter Pugin, the work having been carried out under the direction of Mr. Sebastian Pugin Powell. The cost has been about £7,000, the church accommodating 300 worshippers.

Vauxhall Bridge.—The work of building the new bridge across the Thames at Vauxhall is proceeding continuously, but it is not likely that it will be completed by the end of this year, according to the terms of the contract: next March or thereabouts is a more probable time. The original estimates are likely to be exceeded, as the bridge is expected to involve a total expenditure of nearly £400,000.

Bournemouth Improvements.—New municipal buildings and a town hall are proposed to be erected at Bournemouth at an estimated cost of £126,000, exclusive of furniture, &c. It is also proposed to construct an undercliff drive at a cost of about £60,000, to build a kursaal or pavilion near the pier, and to spend about £20,000 on improvements in the King's Park and Pokesdown, erecting lifts on cliffs, and constructing shelters on the pier, &c.

Restoring St. Bartholomew-the-Great.—The work of restoring the three bays of the cloisters of St. Bartholomew-the-Great, West Smithfield, is making good progress. This part of the building, which has lately been bought back, will soon be ready for opening. A free lecture on the history and architecture of the church was given on Saturday last, and another will be given on Saturday, October 28th, at 3 o'clock. No fees are charged for admission to any part of the church, but a collection is made for the work on the cloisters, which is in much need of funds.

An Atrocious House has been completed at 76, Oakley Street, Chelsea, for Dr. Phené, an eccentric antiquary with a large income. The house is in imitation of one occupied by the doctor's ancestors at Savinay, on the Loire, demolished during the Huguenot troubles. Over the door is “Renaissance du Château de Savinay.” No description would adequately convey the rest. The colour of the background is a dark red, and projecting from this are eight balconies with cream-coloured glazed columns picked out in gilt. All else is a medley of angels, gargoyles, lions and griffons, such as come in unreasonable dreams.

A new Council School at Gillingham has just been completed. Mr. J. Hatchard Smith, F.R.I.B.A., of London, E.C., was the architect, Mr. H. Harris the builder, and Mr. C. H. Langley the clerk of works. The school is built of picked yellow bricks, with red brick quoins to angles and glazed brown brick dados up to sill level. The roofs are tiled. All floors are of wood blocks on concrete, except cloak-rooms, lavatories and corridors, which are paved. Walls and ceilings are plastered with “Sirapite,” the lower portion being finished with cement, painted, and the upper part distempered: joinery pitch-pine, lightly stained and varnished. Accommodation is provided for 300 girls, 300 boys and 320 infants. The central hall plan, with classrooms around, has been adopted. The total cost of the school, including playgrounds but exclusive of desks, will not exceed £9,800, the work being carried out within the contract sum without any extras.

Complete List of Contracts Open.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
BUILDING :				
Oct.	19	Kendal—Works	J. Alexander & Sons	J. F. Curwen, Architect, 26 Highgate, Kendal.
"	19	London, E.—Alterations	Guardians	J. M. Knight, Architect, 35 Bancroft Road, Mile End Road, London, E.

Contracts Open.

BOROUGH OF TUNBRIDGE WELLS.

TO ROAD CONTRACTORS.

PRIVATE STREET WORKS.

The Council of the Borough are prepared to receive TENDERS for the Paving, Metalling, and Making-up of Manor Road, Erskine Park Road (part of), Hillview Road, and Meadow Road.

Plans, sections, and specifications can be seen, and copies of the bill of quantities obtained, at the office of the Borough Engineer and Surveyor (Mr. W. H. MAXWELL, A.M.I.C.E.), Town Hall.

The person or firm whose tender is accepted will be required to enter into a contract and bond, with two approved sureties, for the due performance of the Contract.

Tenders, endorsed "Private Street Works," to be sent to me on or before FRIDAY, the 27th OCTOBER, 1905, at 9 a.m.

The Corporation do not bind themselves to accept the lowest or any Tender.

Town Hall,
Tunbridge Wells,
13th October, 1905.
By order,
W. C. CRIPPS,
Town Clerk.

ISLE OF ELY EDUCATION COMMITTEE.

TENDERS are invited for the ERECTION at March of a block of ELEMENTARY SCHOOLS to accommodate 600 boys and girls.

Those desirous of Tendering are requested to send their names and addresses to the undersigned not later than OCTOBER 18th, 1905, with a deposit of five guineas (by cheque payable to the order of the Isle of Ely County Council), which will be returned on receipt of a bona fide Tender.

Quantities (supplied by Mr. F. T. MULLETT, Cambridge) will be forwarded with a notification when drawings and specification can be inspected.

The Committee do not bind themselves to accept the lowest or any Tender.

R. S. W. PERKINS,
County Surveyor.
Common Road, Ely, Cambs.
October 7th, 1905.

TO BUILDERS AND CONTRACTORS.

TENDERS are invited for the ERECTION of 61 HOUSES, for the Gadjys Uchaf Building Club, Aberdare. Plans and specifications may be seen and all particulars obtained at the offices of the Secretary.

Tenders, sealed and endorsed, to be sent to the SECRETARY, Mr. T. D. Williams, Accountant, to Canon Street, Aberdare, on or before the 21st day of OCTOBER, 1905. The lowest or any tender will not necessarily be accepted.

EAST SUSSEX COUNTY COUNCIL.

TO BUILDERS.

TENDERS are invited for the ERECTION of new POLICE OFFICES and SUPERINTENDENTS' HOUSES and ALTERATIONS to the existing BUILDINGS at Lewes, for the East Sussex County Council.

Plans, specification, and conditions of Contract may be seen, and bills of quantities obtained, after FRIDAY, 6th October next, on application to Mr. F. J. WOOD, County Surveyor, Lewes, between the hours of TEN a.m. and FOUR p.m. (Saturdays Ten a.m. and One p.m.), on payment of a deposit of three guineas, which deposit will be returned upon the receipt of a bona fide Tender.

The contractor whose Tender is accepted will be required to enter into a Contract with the County Council and, if required, enter into a bond with two approved sureties for the due carrying out of the Contract.

Tenders, endorsed "Tender for New Police Offices and Superintendents' Houses," to be addressed and delivered to the undersigned at the County Hall, Lewes, not later than TEN a.m. on FRIDAY, 27th OCTOBER, 1905.

The County Council does not bind itself to accept the lowest or any Tender, and will not pay any expenses in connection with the preparation thereof.

F. MERRIFIELD,
Clerk of the County Council.
County Hall, Lewes,
12th September, 1905.

Property & Land Sales.

TEN ACRES of FREEHOLD BUILDING LAND for £450. Gravel subsoil, within five miles of a county town, railway station 45 minutes from London; capital speculation for good class bungalows.—Write GINN, Tonbridge.

Some claims paid under "The Builders' Journal" Insurance Schemes.

The ease with which an accident happens, and the heavy expense often incurred by doctors' bills and loss of occupation are subjects that every thoughtful man has to consider, and for a Regular Reader of THE BUILDER'S JOURNAL there is no better method of protection than one of the Insurance policies issued by this paper. The following list is interesting, as it gives particulars of some of the claims that have been paid under the BUILDERS' JOURNAL Insurance Schemes.

Builder.—Injury to left arm necessitating amputation. £750.

Architect.—Slipped down steps while carrying bicycle. £6.

Builder.—Kicked by horse. £10 10s.

Architect.—Trod on rusty nail, which entered toe. £4 10s.

Architect.—Slipped on floor, and in falling struck arm of chair. £1.

Builder.—Injured face, left eye, and foot. £6.

Only subscribers to the BUILDERS' JOURNAL are entitled to benefit under our Insurance Schemes, which are guaranteed by "The Ocean Accident and Guarantee Corporation, Limited." A pamphlet giving particulars will be sent on request, and every subscriber should avail himself of one of the following Three Schemes of Insurance.

These are the three Schemes:—

(1) A Free Accident Insurance of £500.

(2) An Accident Insurance of £500.

And also

£250 for Permanent Total Disablement.

£2 10s. per week for Temporary Total Disablement.

Premium, 1/-

(For the conditions under which policies Nos. 1 and 2 are issued readers should refer to our pamphlet, sent on application.)

(3) An Accident Insurance of £1,000,

£500 for Permanent Total Disablement,

£6 per week for Temporary Total Disablement,

with special advantages fully detailed in our pamphlet.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending October 13th twenty-five failures in the building and timber trades in England and Wales were gazetted.

P. S. HOWARD, builder, Charlton. Adj. Oct. 4th.
C. G. TOWNSEND, builder, Deal. R.O. Oct. 5.
J. SAXON, plumber, Hucknall Torkard. R.O. Oct. 6th.
H. VIDLER & Co., builders, Surbiton. R.O. Oct. 3rd.
BONSEY & BAIGENT, builder, Hershham and Walton-on-Thames. R.O. Oct. 4th.
R. PAYNE, builder, Wanborough. P.E., Swindon C.C., Oct. 25th, at 2.30.
HAND BROTHERS, plumber and decorator, King's Norton. Adj. Oct. 7th.
F. S. PENNY, builder, Northfield. P.E., Birmingham C.C., Nov. 15th, at 2.
G. H. WRAY, builder and contractor, Harrogate. Liabilities £606; assets £146.
T. NIXON, builder, London, E.C. Unsecured debts £848; debts fully secured £2,884; assets £1,316.
H. W. BINES, plumber and decorator, Gillingham. Adj. Oct. 5th.
S. CUTLER, painter and decorator, &c., Bournemouth. P.E., Poole Town Hall, Nov. 15th, at 11.30.
J. WILLIAMS, builder, contractor, &c., Swindon. P.E., Swindon C.C., Oct. 25th, at 2.30.
J. W. DENTON, journeyman joiner, late builder, Hull. P.E., Hull C.C., Oct. 23rd, at 2.
H. WARRINGTON, painter and paperhanger, Cawood. P.E., York Courts of Justice, Nov. 3rd, at 11.
W. B. ASHBY, builder, Derby. P.E., Derby C.C., Nov. 4th, at 11.
A. E. LYDFORD, builder, late of Horfield, Bristol. First meeting, O.R.'s, Bristol, Oct. 18th, at 11.30. P.E., Bristol Guildhall, Oct. 27th, at 12.
T. H. COTTON, carpenter, Southsea. First meeting, O.R.'s, Portsmouth, Oct. 19th, at 3. P.E., Portsmouth C.C., Oct. 30th, at 11.
W. HOLT, builder and contractor, Swinton (Cheetham, Manchester). First meeting, O.R.'s, Manchester, Oct. 18th, at 3.30. P.E., Manchester C.C., Oct. 23rd, at 10.
T. E. EDMUNDS, builder, Saltley, Birmingham. First meeting, 191, Corporation Street, Birmingham, Oct. 18th, at 11. P.E., Birmingham C.C., Nov. 15th, at 2.
J. H. HODKIN, joiner and builder, Sheffield. First meeting, O.R.'s, Sheffield, Oct. 19th, at 11.30. P.E., Sheffield C.C., Oct. 19th, at 2.

Coming Events.

Wednesday, October 18.

INSTITUTE OF SANITARY ENGINEERS.—Mr. Aldons on "Ventilation of Buildings," at 7 p.m.

Thursday, October 19.

CARPENTERS' COMPANY.—Mr. H. D. Searles-Wood, F.R.I.B.A., on "Properties and Qualities of Building Materials and how to use them," Carpenters' Hall, London Wall," at 7.30 p.m.
SOCIETY OF ARCHITECTS.—Anniversary Meeting at 8 p.m.

Friday, October 20.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. W. H. Goodyear on "Architectural Refinements," at 4 p.m.
GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. T. L. Watson on "Italian Art," at 8 p.m.
ARCHITECTURAL ASSOCIATION.—Mr. Andrew Oliver on "London City Churches," at 7.30 p.m.
INSTITUTION OF MECHANICAL ENGINEERS.—General Meeting at 8 p.m.

Saturday, October 21.

GLASGOW TECHNICAL COLLEGE SCIENTIFIC SOCIETY.—Mr. H. Dyer on "The Training and Work of Engineers in some of their wider Aspects," at 7.30 p.m.

Monday, October 23.

LIVERPOOL ARCHITECTURAL SOCIETY.—"Opinions on Garden City Cottages," by various members.

Tuesday, October 24.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. W. H. Goodyear on "Architectural Refinements," at 4 p.m.

Thursday, October 26.

CARPENTERS' COMPANY.—Dr. A. Wynter-Blyth on "The Sanitary Arrangements of Buildings, &c.—I.," Carpenters' Hall, London Wall, at 7.30 p.m.

Friday, October 27.

UNIVERSITY COLLEGE.—Mr. D. S. MacColl on "Sculpture—Medieval, Renaissance and Modern," at 4.30 p.m.
JUNIOR INSTITUTION OF ENGINEERS.—Annual General Meeting and First Meeting of the Incorporated Institution, Westminster Palace Hotel, at 8 p.m.

Tuesday, October 31.

UNIVERSITY COLLEGE, LONDON.—Professor E. A. Gardner on "Architectural Sculptures."

Thursday, November 2.

CARPENTERS' COMPANY.—Dr. A. Wynter-Blyth on "The Sanitary Arrangements of Buildings, &c.—II.," Carpenters' Hall, London Wall, at 7.30 p.m.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

October 25, 1905. Vol. 22, No. 559.

6, Great New Street, Fetter Lane, E.C.

Summary.

At last week's meeting of the Architectural Association Mr. Andrew Oliver read a paper on "Ecclesiastical Buildings in the City of London." Speaking of Wren's churches, he said there was no city which showed such variety in its towers and spires, and all these might be said to be due to the genius of one man. Of the extensive monastic establishments which once existed, all that remained was the chancel of St. Bartholomew, Smithfield, and part of the cloister of the church of St. Helen, Bishopsgate, the nave of the church of the Austin Friars, part of the Charter House, the gateway, crypt and the nave of the Priory of St. John, Clerkenwell, and the Temple Church. (Page 239.)

Mr. Claude Bragdon elaborates some interesting theories about the persistence of the triangle in architectural design, and makes deductions in regard to the relations existing between musical ratios and architectural proportions. (Page 233.)

Mr. A. E. Pridmore is the new president of the Society of Architects. The financial condition of the Society is sound, the reserve fund now standing at £1,100. (Page 238.)

No successor has yet been appointed to the late Count Sacconi, the selected architect of the memorial to King Victor Emmanuel II. at Rome. It is more than twenty-five years since the Italian Parliament decided on the erection of this memorial, the cost of which down to the end of last year was about £750,000. It is still far from completion. (Page 238.)

Attention is called to the confusion which often exists in the public mind between estimates of probable cost and actual tenders for building. (Page 241.)

In America the heating of schools by hot air has been almost entirely superseded by steam and hot water, combined with fan ventilation. Temperatures, however, are kept very high—as high as 70 degs. Fahr.—though it must not be forgotten that the percentage of humidity in the air is small compared with this country, and most people find that 70 degs. is not more comfortable in America than 60 degs. in England. (Page 244.)

In a case heard at the City of London Court recently the judge decided that a clerk of works was entitled to a month's notice. (Page 242.)

A saving of £15,874 has been made on the building of Hollymoor Asylum, Birmingham. Only on incidental expenses was the estimate exceeded and then only by £1,329. (Page 242.)

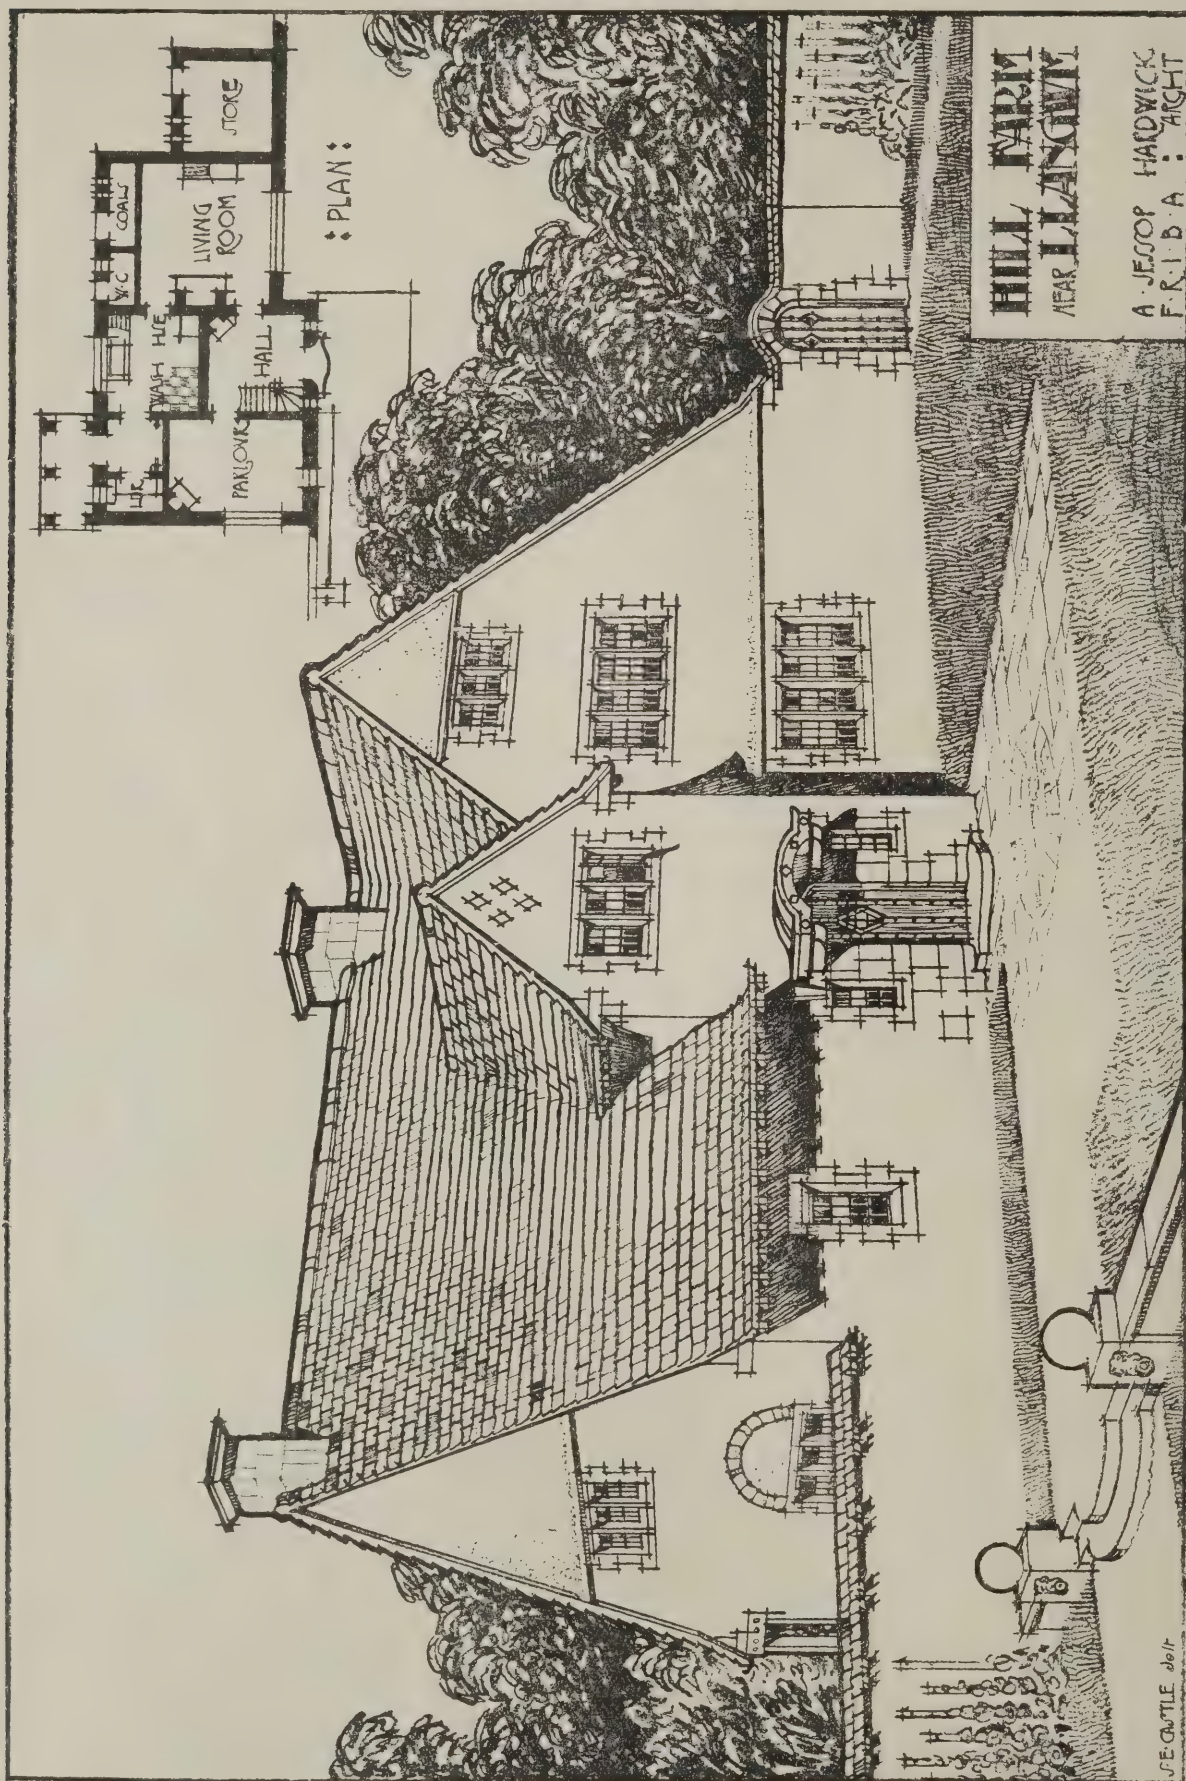

Mr. Goodyear has begun his series of lectures on architectural refinements, at Edinburgh. (Page 238.)

Quick Building.

MODERN commercial needs necessitate the erection of buildings at a rapid rate, much more so than was ever required in the past. Every day the building trade is being asked to do more and more in a certain time. Rapid building requires the quick delivery of materials, and unless these can be obtained more readily, and in larger quantities than at present, progress in the rapid construction of buildings will be hampered. A distinguishing feature of practice in the United States is that contractors can obtain almost any quantity of materials in a short time by going to large yards or manufacturing employments many hands: that is to say, the work is concentrated into comparatively fewer but larger firms. In this country there are very few stoneworking yards in large towns which could supply stone in big enough quantities to enable a large building to be rapidly erected. It would be impossible, for instance, to put up a building such as the Government offices in a year or two, whereas buildings of similar magnitude are continually being erected in the United States in this time. It is the same with other materials. Even iron and steel—commodities in which the engineering trades of this country have been for long concerned—cannot be obtained in large and regular deliveries. It is one of the drawbacks that the supply cannot be depended upon. The delivery is very fitful, while the railway facilities are equally behindhand. Our small trucks are very inferior in comparison with the large freight cars used abroad. This means that we cannot have stone, for instance, worked at the quarries, and so be enabled to assemble large quantities from a number of firms, as the buffering that occurs on our railways with such small cars, and their inadequate construction, injures any delicate goods. Thus stone with elaborate detail has to be worked in the town and delivered by carts or motor vans. The railway system being as it is, we cannot expect to obtain quick building by obtaining goods in large quantities from a number of manufacturers, and for the future it means that if we are to be able to have buildings erected rapidly there must be larger firms with greater facilities for the supply of materials. Whether these can be obtained by the combination of existing firms or by the influx of men who appreciate the need, and are willing to supply it, remains to be seen, but there is no doubt that we require greater efficiency in this as well as in other branches of the building industry. Quicker work would not mean sweated labour, but that every man would be in employment and that the earning capacity of the nation would be greater.

Rebuilding Westminster.

THE rebuilding of London seems to be proceeding apace. Within the last few years many large enterprises have been embarked upon, and our streets are already presenting a new aspect—an aspect which, we think, all will recognize as an improvement on the earlier flat-fronted later Georgian and early Victorian era, and the subsequent reign of terra-cotta with overloaded ornament. The latest rebuilding scheme for London deals with a portion of Westminster where residential houses of the well-to-do have been turned into tenements and slums. At yesterday's meeting of the London County Council the Improvements Committee reported with reference to the letting of the surplus lands connected with the Westminster improvement scheme at present being carried out that an advantageous offer had been made by a company registered as the Victoria Embankment Contract Syndicate (Ltd.) for a lease of the whole of the surplus land. Negotiations which had been carried on had resulted in the syndicate offering terms which the committee had no hesitation in advising the Council to accept. It had been agreed, subject to the Council's approval, that the syndicate should pay an ultimate ground rent calculated at the rate of 4 per cent. per annum on the total gross cost of the improvement, including the cost of the purchase of property and compensation, the provision of rehousing accommodation, and paving, &c., works. The syndicate stated that they proposed to erect, in brick or stone, buildings of fine architectural character. The expenditure in erecting the buildings on the Council's land and on the additional land was estimated at £2,500,000, so that the Council would have full security for its ground rent. Moreover, as about one-third of this sum would be spent in wages, it was apparent that constant employment during the next few years would be afforded to a considerable number of workmen. The Council would retain full control over the lines of frontage and also over the architectural treatment of the buildings to be erected, the plans being submitted for approval in the usual way. The committee think that the fact that so large an undertaking is to be executed on this improvement will have a beneficial effect on the disposal of the valuable surplus land in Kingsway and Aldwych. The report further stated that the syndicate desired that powers should be sought over the property to the west of the area of the improvement included in their scheme of 1898, but not included in the Council's scheme sanctioned by Parliament in 1900. The acquisition of this land, which will cost about £550,000, will be dealt with in a Bill to be promoted by the syndicate.

This house is a few miles on the road to Usk (Mon.) and has recently been completed. The walls are built of local stone covered with white rough-cast, and the roofs have red Bridgewater tiles. Where stone is revealed externally is Forest of Dean grey stone. Most of the external woodwork is oak, kept its natural colour. The gutters and down-pipes are painted black, and the whole of the details were kept very simple with a view to economy. The contractors were Messrs. E. Turner & Sons, of Cardiff, and the architect was Mr. A. Jessop Hardwick, F.R.I.B.A., of Kingston-on-Thames. The iron casements and leaded glass were supplied by Messrs. George Wragge, Ltd., of Manchester.

FIG. 1.

NEW THEORIES OF ARCHITECTURE.—I.

SOME little time ago an American writer, Mr. Claude Bragdon, subsequent to an address on "Mysticism and Architecture" which he delivered before the third annual convention of the Architectural League of America, wrote a series of essays elaborating the theories which had been set forth in his address. These theories may or may not be approved by the reader, but at any rate they are interesting, and we propose therefore to give them in this and a second article, these constituting the substance of the essays referred to above. The essays, six in number, originally appeared in our American contemporary "House and Garden," from which the accompanying illustrations are taken as representative of the whole series published.

The Argument.

Walter Pater has said that all art constantly aspires towards the condition of music. This is perhaps because all art has its root in number, being in one of its aspects only a system of harmonious numerical ratios, of which music is the direct sensuous expression. Everything in its last analysis is number; and geometry is the manifestation of number in space. The ancient Pythagorean precept and the latest generalization of modern science meet here on common ground.

When ideas enter phenomenal life they assume perforce a threefold aspect. They appear as cause, operation and effect; or they take on the three dimensions of length, breadth and thickness. Of this number three, an equilateral triangle, the simplest of symmetrical plane figures, is the geometrical equivalent; and if this pair, one of the two symbolizing time and the other symbolizing space, be represented by means of intersecting equilateral triangles, forming a hexagram, the resultant figure is that ancient, beautiful and mystic symbol popularly known as Solomon's Seal, or the Shield of David.

It appears that this, the equilateral triangle, taken singly, doubled, and in the form of the regular hexagon, is one of nature's archetypes, or universal patterns, for it occurs in the snow-crystal, in the bee's cell, in flower forms without number, and it can be traced—though more obscurely—in insect and animal structure, and even in the body of man himself.

It is not surprising that a figure of such significance in nature is of importance also in art, for art is "idealized creation"—nature carried to a higher power by reason of its passage through a human consciousness. According to Schopenhauer, it is possible to resolve all music into two chords, the dominant seventh and the tonic: one of longing and striving, and the other of rest and fulfilment. These are to be conceived of as the interlaced equilateral triangles of harmony, for three is the least

number of notes of which a chord can be composed, as it is the least number of lines with which it is possible to enclose a space. The hexagram of colour is more familiar, consisting, as it does, of the three primaries—red, yellow and blue, and the three secondaries—orange, green and purple. Three colours are required to form the chord, which comprises any given colour and its complement; one of the two being, of course, a binary.

The important part played by the equilateral triangle in the art of painting can be little more than suggested within the limits of this article, but any interested reader can easily pursue the subject for himself.

The problem which pre-occupied the painters of the Italian Renaissance was, as Symonds says of Leonardo, "to submit the freest play of form to simple figures of geometry in grouping." Alberti held that the painter should above all things have mastered geometry; and it is known that the study of perspective and kindred subjects was widespread and popular. The first artist to achieve a thoroughly scientific scheme of composition, based on geometrical principles, seems to have been Fra Bartolommeo, in his Last Judgment, in the church of S. Maria Nuova, in Florence. Symonds says of it: "Simple figures—the pyramid and the triangle, upright, inverted and interwoven like the rhymes of a sonnet—form the basis of the composition. This system was adhered to by the Frate in all his subsequent works." Raphael, with that power of assimilation which distinguishes him among men of genius, learned from Fra Bartolommeo this method of disposing figures, and combining them in masses with almost mathematical precision, and the equilateral triangle was one of his favourite devices.

Architecture is the most closely related of all the arts to geometry. Indeed, in a certain sense, architecture is geometry made concrete and ponderable. As Emerson says: "The pleasure a palace or a temple gives the eye is that an order and method has been communicated to stones, so that they speak and geometrize, become tender or sublime with expression." Over and above its obvious geometry, every truly great and beautiful work of architecture is harmoniously proportioned, both as a whole and as to its parts, by reason of these being in a manner co-incident with certain simple symmetrical figures of geometry. These, though invisible to the sight and not consciously present in the mind of the beholder, serve to co-ordinate the entire fabric into one memorable whole. Chief among such figures, by reason of its peculiar properties and perfection, is the equilateral triangle. It would seem that the eye has an especial fondness for this figure, just as the ear has for certain related musical sounds. It may

FIG. 2.

FIG. 3.

be stated as a general rule, that whenever three important points in any architectural composition approximately coincide with the three extremities of an equilateral triangle it makes for beauty of proportion.

An ancient and notable example occurs in the pyramids of Egypt, the sides of which, in their original condition, were, it is believed, equilateral triangles. It is a demonstrable fact that certain geometrical intersections give the proportions of the Greek orders. The perfect little Erechtheum of the Athenian acropolis would seem to have been proportioned by means of the equilateral triangle, both in general and in detail. The same figure, in conjunction with the square and the circle, was employed by the Romans in designing triumphal arches, basilicas, and baths. The *vescia piscis*, consisting of two arcs of a circle enclosing a double equilateral triangle, was often used during the Middle Ages in laying out the plans of churches and cathedrals. It is scarcely an exaggeration to say that an entire system of window tracery was based upon the circle and the equilateral triangle. That the latter figure was a determining factor in the proportioning of Gothic buildings is sufficiently proven (if such proof were needed) by the accompanying facsimile reproduction of an illustration from the Como edition of Vitruvius, published in Milan about 1521, which shows a vertical section of Milan cathedral, together with the system of equilateral triangles which determined its principal proportions. The architects of the Italian Renaissance, inheriting the Roman tradition in such matters, constantly recognized this essential principle of monumental design.

There is abundant evidence in support of the theory that the builders of antiquity, the masonic guilds of the Middle Ages, and the architects of the Italian Renaissance followed certain geometrical rules of proportion; but

even though this theory be denied or disproven—if after all these men obtained their results working unconsciously and at hazard—the fact of the existence of such rules remains unchanged, for, as has been well said, “the artist follows the rules without knowing them.” Laws of beauty there are, of which this rule of three is one, which are “dependent on the nature of human intelligence”—deep as the foundation of the world.

“Frozen Music.”

The famous saying that architecture is “frozen music” is a poetical statement of a philosophical truth. Music depends primarily upon the equal and regular division of time into beats, and of these beats into measures. Architecture implies the rhythmical division of space, and obedience to laws numerical and geometrical. A certain identity, therefore, exists between simple harmony in music and simple proportion in architecture. By translating the consonant tone intervals into number, “the universal solvent,” it is possible to give them a spatial, that is, an architectural expression. Such expression, considered as proportion only and divorced from ornament, will prove pleasing to the eye in the same way that its correlative is pleasing to the ear.

If a vibrating string yielding any given musical note be stopped in its centre, that is, divided by half, it will then give the octave of the original note. The numerical ratio which expresses the interval of the octave is, therefore, 1 : 2. If one-third instead of one-half of the string be stopped, and the remaining two-thirds struck, it will yield the musical fifth of the original note, which thus corresponds to the ratio 2 : 3. The length represented by 3 : 4 yields the fourth, 4 : 5 the major third, and 5 : 6 the minor third. These comprise the principal consonant intervals within the scope of one octave. The ratios of inverted intervals, so-called, are found by

THE NORMAN PORCH CANTERBURY—AN ARCHITECTURAL EXPRESSION OF A NOTE & HARMONICS

FIG. 7.

doubling the smaller number of the original interval as given above. 2 : 3, the fifth, gives 3 : 4, the fourth; 4 : 5, the major third, gives 5 : 8, the minor sixth; 5 : 6, the minor third, gives 6 : 10, or 3 : 5, the major sixth.

Of these various consonant intervals the octave, fifth and major third are the most important because the most perfect. It will be noted that all of the intervals above given are expressed by means of the numbers 1, 2, 3, 4, 5 and 6, except the minor sixth; and this, of all consonant intervals, is the most imperfect. The sub-minor seventh, whose ratio is 4 : 7 (Fig. 8), though included among the dissonances, forms according to Helmholtz

FIG. 6.—VERTICAL SECTION OF MILAN CATHEDRAL, FROM THE COSMO EDITION OF VITRUVIUS

a more perfect consonance with the tonic than the minor sixth.

A natural deduction from these facts is that relations of architectural length and breadth, height and width, to be "musical," should be capable of being expressed by ratios of quantitatively small numbers. Although, generally speaking, the simpler the ratio the more perfect the consonance, yet the intervals of the fifth and major third (2:3 and 4:5) are more pleasing than the octave (1:2), which is too obviously a repetition of the original note. From this it is reasonable to assume (and the assumption is borne out by experience) that proportions, the numerical ratios of which the eye resolves too readily, become at last wearisome. The relation should be felt rather than fathomed. As in music, where dissonances are introduced to give value to consonances which follow them, so in architecture simple ratios should be employed in connection with those more complex.

THE RELATION BETWEEN THE SUBMINOR SEVENTH (4:7) AND THE EQUILATERAL TRIANGLE~

FIG. 8.

Harmonics are those tones which sound with and reinforce any musical note when struck. The distinguishable harmonics of the tonic are given in Fig. 7. They yield the ratios 1:2, 2:3, 4:5 and 4:7. The note and its harmonics form a natural chord. Fig. 9 illustrates a simple application of musical ratios to architecture. The subminor seventh (4:7) used in this way in connection with the simpler intervals of the octave (1:2) and the fifth (2:3) is particularly pleasing, because it is neither too obvious nor too subtle. This interval is important from the fact that it expresses the angle of 60 degs., because the numbers 4 and 7 represent (very nearly) the ratio between one-half the base and the altitude of an equilateral triangle. According to Gwilt, the Gothic chapels at Windsor and Oxford are divided longitudinally by four, and transversely by seven equal parts.

A distinguishing characteristic of the series of ratios which represents the consonant intervals within the compass of an octave is that it advances by the addition of 1 to both terms, 1:2, 2:3, 3:4, 4:5 and 5:6. Such a series always approaches unity, just as, represented graphically by means of parallelograms, it tends toward a square. According to W. Watkiss Lloyd, the scale of ratios which determined all the important proportions of the Parthenon is of this order, advancing by consecutive differences of 5, as shown in Fig. 10. Mr. Lloyd goes on to say: "The oblong plan of the temple has exactly the proportion of breadth to length of 4:9-131'341 front, 228'141 on flank, (error, '012). The same proportion is repeated in the well-marked definition of breadth of top step—the hundred Attic feet—and the height from this step to the top of the horizontal cornice." (It will be noted that this, the most important ratio, is not the simplest.)

It would be a profitless task to attempt to formulate exact rules of architectural

FIG. 12.

proportion based upon the laws of musical harmony. The two arts are too different from each other for that; and moreover the last appeal must always be to the eye, and not to a mathematical formula, just as in music the last appeal is to the ear. Nothing is truer than that "the concept is unfruitful themselves to the artist as he proceeds, and in art." Laws there are, but they discover are for the most part incommunicable. No masterpiece was ever fashioned by means of predetermined formulæ of beauty, though from every masterpiece such formulæ may be deduced. And these are useful and valuable, not as a substitute for inspiration, but as a guide: not as wings, but as a tail. In the present instance, perhaps all that it is necessary for the architectural designer to consider is that important ratios of height and width should be composed of quantitatively small numbers; and that, if possible, they should obey some simple law of numerical progression. From this basic simplicity complexity will follow, but it will be an ordered and harmonious complexity, like that of a tree, or of a symphony. In the same way that a musical composition implies the division of time into equal and regular beats, so a work of architecture should have for its basis some unit of space. This unit should be nowhere too obvious, and may be varied within certain limits, just as musical time is retarded or accelerated. The underlying rhythm and symmetry will thus give value and distinction to such variation. Fig. 11, which shows a Doric and a Corinthian arcade laid out according to Vignola, illustrates how close a parallel exists between music and architecture in this matter of rhythm.

It is a demonstrable fact that musical sounds weave invisible patterns in the air. Architecture, in one of its aspects, is geometric pattern made tangible and enduring, i.e., "frozen music." In illustration of this, note the identity between the fragment of sculptured detail from the Erechtheum (Fig. 12) and the central portion of the front of Notre-Dame. The traceried arcades of the Venetian Ducal Palace remind one irresistibly of music. Every well-composed façade makes harmony in three dimensions: every good roof-line makes melody against the sky (Fig. 14).

(To be concluded.)

COTTAGES ERRECTED ON THE
CARRINGTON ESTATE AT AN INCLUSIVE
AVERAGE COST OF £153 10S. EACH.
J. CARTER JONAS & SONS, ARCHITECTS.

FOUNDATIONS.

SECTION

EARL CARRINGTON'S COTTAGES.

ON p. 220 of our issue for last week we gave particulars of the cottages which Earl Carrington has erected on his estates in Buckinghamshire and Lincolnshire at an average cost of £153 10s., inclusive of builder's profit, but not architect's fees, because the design was prepared by his agents, Messrs. J. Carter Jonas & Sons, of Cambridge. The specification for these cottages, which may be seen at the agents' offices, does not call for detailed particulars, as it is of ordinary character, but we give the form of agreement below as being of considerable importance and use to architects and landowners:—

MEMORANDUM OF AGREEMENT made this _____ between J. CARTER JONAS & SONS, of Cambridge, as agents for and on behalf of the Rt. Hon. EARL CARRINGTON of the one part and _____ builder of the other part, hereinafter called the said "contractor"

WITNESSETH that the said _____ doth hereby agree to perform and execute the whole of the before-mentioned works agreeably to and in conformity with the following conditions and the above directions. To provide all kinds of materials, tools, scaffolding, tackle, centering

and everything requisite to complete the before-mentioned works to the fullest intent and meaning of the accompanying specification and drawings; to provide all labour and pay the current rate of wages of the district. That all and singular the said work shall be performed in a good sound and workmanlike manner with the best materials of their respective kinds well-seasoned and to the satisfaction of the said J. Carter Jonas & Sons, the surveyors, or such other surveyor for the time being the said Earl Carrington may appoint. And that in case the said contractor shall refuse or neglect to do and perform all and singular the said several works in such manner and with good and well-seasoned materials as hereinbefore is provided, or in case of his bankruptcy, death or insolvency, then it shall and may be lawful for the said J. Carter Jonas & Sons to employ and engage any other person or persons to perform, execute and complete the said several works which may be left by the said contractor unperformed or unfinished, and to find and provide materials for the same, and the costs and charges thereof shall be paid or allowed by the said contractor to the said Earl Carrington out of the moneys that may be then due or hereafter to become due to the said contractor for or on account of the performance of all or any part of the works hereby agreed to be done and executed. That in case the said Earl Carrington or his agents shall be dissatisfied with the manner in which the said works or any part thereof are proceeding, and shall deliver to the said contractor, or leave or cause to be left or sent to him by post at his usual place of abode or business a written notice stating the cause or reason of such dissatisfaction, then and in such case the said contractor shall and will forthwith reform and rectify such part or parts of the said works in such manner as shall thereby be particularized and required and conformably with the true intent and meaning of these presents. The said works to be commenced directly after the signing of the contract, and all the works contracted for, together with such as may be incidental thereto, are to be fully completed and possession of the premises given up to the said Earl Carrington upon or before the

next ensuing, and in default the said contractor is to forfeit the sum of _____ pounds per week for every week that they may remain unfinished after the date above-named for completion, such penalty to be stopped out of any moneys due to the said contractor. From the commencement of the said works to their completion, the care of the same and of whatever appertains thereto shall rest with the said contractor, solely, and no allowance shall be made for anything which may be lost, stolen, injured or destroyed. The works stipulated are to go on and be forwarded or retarded at such times and in such manner as the said J. Carter Jonas & Sons may direct, or as the state of the weather shall dictate, and in all cases of authorized delay a reasonable extension of time will be accorded in writing to the said contractor, who shall in case of any temporary stoppage from the weather or other cause duly cover up and protect the said works from damage, or make good the same, and in case it shall be deemed necessary or desirable by the said J. Carter Jonas & Sons to make any alterations, addition to, or omissions from the said works hereinbefore specified, the said J. Carter Jonas & Sons shall be at full liberty to do so, six days additional time beyond the time above-mentioned being allowed for doing every twenty-five pounds' worth of extra work, and such alterations shall not vitiate or vacate the contract hereby made or intended to be made, but whether arising by reasons of additions to or omissions from the aforesaid works shall be estimated and valued at the contract prices by the said J. Carter Jonas & Sons, whose decision as to their value shall be final and binding on all parties concerned, and who shall be the sole arbitrators in settling any dispute that shall or may arise in or about the said works. That in consideration of the said works to be done and executed in the erection of _____ pairs of cottages and outbuildings hereinbefore described, the said Earl Carrington doth hereby agree to pay or cause to be paid to the said contractor the sum of _____

in manner following, that is to say, seventy-five pounds per centum on the valuation and certificate of the said J. Carter Jonas & Sons as the works proceed, and the balance three months after the date of the certificate of the said J. Carter Jonas & Sons that the said works are complete, and upon the further certificate of the said J. Carter Jonas & Sons that the said works have properly stood. It being hereby further agreed that any damage arising to the said works, and any defects which may become apparent in the said works from the use of improper or unsound materials, bad workmanship or faulty or insufficient foundations within three months after the date of the said certificate of the said works being complete,

shall be rectified, remedied and made good to the fullest extent, and in every respect to the satisfaction of the said J. Carter Jonas & Sons, by the said contractor at his own costs and charges, and the said balance is to be further retained by the said Earl Carrington until all such damage or defects shall have been rectified, remedied and made good as aforesaid.

IN WITNESS WHEREOF the said parties have hereunto set their hands the day and year aforesaid.

In reference to Earl Carrington's letter to the "Times," given in our issue for last week, Mr. A. H. Clough writes: "As regards the cost of cottages, it will be observed that most of Lord Carrington's building operations are rather ancient history; only one pair of the specified cottages was built in the last ten years. But the cost of building has risen. The Board of Agriculture stated in evidence the other day that this increase has been very large in the last fifteen years, that it has been found necessary to allow loans of as much as £520 for a pair of cottages, and that £350 (the cost in Norfolk) is the lowest price now met with. However, it is probably true that in certain exceptional cases it would still be possible to build a very ugly pair of six-roomed houses for £300. But the experience of the Garden City Exhibition, where materials are exceptionally cheap and labour not particularly dear, shows that this would be difficult. The prize £150 cottage is extremely plain and economically planned. The rooms are good, but there are only five, not six. Yet cottages of this pattern (with the extras not reckoned in the £150), even at Garden City prices, would cost £340 a pair. At Guildford, according to the calculation of the council's surveyor, the cost of such a pair would be well over £400. It seems likely, therefore, that Lord Carrington's figures are not a safe guide for the ordinary country gentleman. Lord Carrington argues as follows:—I can build for £150 a six-roomed cottage 'in honest brick,' I am satisfied with a 2 per cent. return, and I look with contempt on wood and mud and plaster. But if the £150 turns out to be £200, if landlords would build for a 4 per cent. return, and not less, and if qualified architects and surveyors report that other materials are satisfactory, and that 'honest brick' may be porous and lets in water, we need not spend much time on Lord Carrington's rather obsolete statement of cost. To turn to the question of by-laws, Lord Carrington has clearly had very little experience of their working. He is no doubt unaware that in some districts a height of 9 ft. is required in all cottage bedrooms, and that surveyors frequently obstruct building by gratuitous bullying. Cases are reported this week of a surveyor sending back plans to ascertain the exact size of the hearths and the position of the movable dustbin. . . . I have had the pleasure of seeing Lord Carrington's plans. They would not, as they stand, satisfy the by-laws of any council under which I have built, not even those of the Garden City."

Garden City: Reply to a Lambeth Critic.

In reply to the criticism of the prize cottage at Letchworth made by Councillor Bristowe, of the Lambeth Borough Council (see p. 220 of our issue for last week), Mr. Thomas Adams, secretary of First Garden City, Ltd., says: "No plaster has 'left' the walls of this cottage, as alleged. Certain visitors prised the plaster off to see its thickness. . . . The object of the exhibition was to demonstrate the kind of cottage to be built in rural districts. London is not a rural district. . . . By the evidence of the judges . . . most of the cottages entered for the £150 prize were built for that sum. The builders of the first-prize cottage now offer to repeat it for £175, including profit and fees. . . . The land for the Cheap Cottages Exhibition has been let at from £7 to £15 an acre, the average being about £10, which represents a loss to the First Garden City: and this company had no connection whatever with the conference attended by Councillor Bristowe. The conference was called by the National Housing

Reform Council, and the Garden City Co. only lent the hall in which it was held, without charging any rent. The charge of 5s. was made by the Housing Council, and did not, I understand, pay expenses. . . ."

WAR OFFICE PLANNING.

A Severe Criticism.

THE "British Medical Journal" severely criticizes the plans for a home for the military nursing service which is to be erected in connection with the new military hospital at Millbank. Our contemporary says: "The plans were, we believe, drawn some time ago for the War Office by an engineer officer, and have, we understand, been finally adopted in the teeth of criticisms which, on investigation, we find to be well founded. The Army Nursing Home at Millbank is the first to be erected by the War Office, and will, no doubt, be taken as a model towards which other quarters for Army nurses, and other homes erected in connection with other military hospitals, may be expected to approach. It ought, therefore, to represent the last word on nursing homes, and, at any rate, not be inferior to homes erected in connection with voluntary civilian hospitals or poor-law union infirmaries. That it will be inferior there is clearly no doubt, unless public opinion can still restrain the War Office from carrying out the amateur plan which it has evolved. The War Office ought to call to its assistance the services of an architect of eminence experienced in the designing of hospitals and their appurtenances, and he should be given a free hand to bring the plans into harmony with modern requirements."

ARCHITECTURAL ASSOCIATION OF IRELAND.

President's Address.

THE annual general meeting of the Architectural Association of Ireland was held last week in Dublin, Mr. Harry Allberry, A.R.I.B.A., president, occupying the chair.

Mr. H. G. Leask, the secretary, read the eighth annual report, which stated that the past session had been one of the best since the Association was re-established in 1896. The present membership was 138.

The president in his inaugural address referred to the rumour that the buildings for the forthcoming Dublin Exhibition would emanate from the English side of the Channel. Architects at present in wealthy practice had perhaps no occasion to heed the signs of the times, but would it not be less selfish on their part to take thought for their successors and help them forward for battle in the years to come? Their ideal policy should not be that of the sealed compartment; it should be rather that of the open door, welcoming all competition, copying what was best and improving what might be bettered. The president then urged the importance of forming an Architectural College in Dublin on the lines of that at King's College, London. He also pointed to the necessity of giving lectures and holding examinations in connection with their profession, so that architects might possess proof of their qualifications.

Obituary.

Mr. Richard Price, a well-known builder and contractor in Shrewsbury, died suddenly last week, aged 69.

Mr. William Jenkyns, who for many years was closely identified with the late firm of Messrs. W. & J. Smith, city architects, Aberdeen, died last week in his ninety-first year. He supervised the building of Balmoral Castle.

THE VICTOR EMMANUEL MEMORIAL.

Death of the Architect.

IN our issue for September 27th we announced the death of Count Sacconi, the selected architect for the huge monument to Victor Emmanuel II. at Rome—a far more costly erection than the National Memorial to Queen Victoria. Count Sacconi's successor has not yet been appointed, and in the interregnum which prevails the Rome correspondent of the "Morning Post" has taken the opportunity of going all over the works, of which some sceptics say, as used to be said of Cologne Cathedral, that they will never be finished. It is more than twenty-five years since the Italian Parliament decided on the erection of this memorial, but it was not till 1884 that, after two competitions, the choice of an architect was made, and a design definitely adopted.

The Architectural Scheme.

Count Sacconi's plan, now in course of execution, comprises a great colonnade flanked by two square towers, in front of which is the huge pedestal which is to support the equestrian statue of Victor Emmanuel II.; the cast of his horse is now finished, and the horse itself will shortly be founded in Rome. Beneath this central figure it is proposed to have an allegorical representation of the cities of Italy doing homage to Rome. The monument will also contain large chambers, which will serve as a museum for the banners and other trophies of the *Risorgimento*. There will be two entrances—one in the front, up a flight of steps, from which a second flight will lead to the base of the great statue, and yet another to each side of the colonnade; while a second entrance at the back will pass through a tunnel beneath the steps of Ara Coeli and thus communicate with the Campidoglio. The monument will stand at a height of 235 ft. and will face straight down the Corso. The inside will be ornamented with rare old marbles found in the bed of the Tiber and elsewhere. Undoubtedly the whole when completed—and that cannot be before 1911 at the earliest—will be grandiose, like the now almost finished Palace of Justice at Rome. Whether it will be beautiful is a point on which opinions differ. "Very modern Italians assure me," says the correspondent, "that people will cross the Atlantic to see it; personally I think that Americans and Englishmen would prefer to see what it has displaced." These "displacements" include the picturesque sixteenth-century tower of Paul III., the Franciscan monastery belonging to the Church of Ara Coeli, fifty houses, and—worst of all—the picturesque Palazzetto, adjoining the Palazzo di Venezia. "Finally, it seems a crime against history to burrow under the steps of Ara Coeli, erected to commemorate the Black Death and the one considerable monument of the Avignon Papacy now left in Rome. Fortunately, the authorities have spared the interesting and massive blocks of the ancient Wall of the Kings, which were found during the excavations for the foundations of the monument. It is appropriate that the first kings of ancient Rome should have their monument by that of the first king of modern Italy."

The Colossal Expense.

Down to the middle of June, 1902, when no visible constructive work had been done, no less than £324,520 had been spent on prizes, models, funicular railways, foundations and compensations for houses destroyed, the last item alone amounting to £149,320, which might have been enormously reduced had the statue been erected on the Janiculum or on Monte Mario. The desire to have it on the Capitoline has thus not only led to unnecessary destruction but to unnecessary waste of money also. Down to the end of last year an additional £400,000 had been

spent, and there is more than five years' work still to be reckoned before the bill is complete. Thus the original sum of £320,000 voted by the Italian Parliament, even with the addition of another £57,509 subscribed by the public, has long ago been exhausted, and last year another £120,000 was granted. Continual strikes among the workmen—of whom there are 450 engaged on the monument itself and in the adjacent small stone-yards, as well as in the larger ones outside the Porta Maggiore—have caused extra delay and expense. Now arises the question of a successor to the architect—a man who will loyally carry out his work and not seek to earn fame for himself by altering the design.

SOCIETY OF ARCHITECTS.

Annual General Meeting: Report of Council.

THE annual general meeting of the Society of Architects was held on Thursday last at Staple Inn Buildings, Holborn, the chair being occupied by the retiring president, Mr. Walter W. Thomas, of Liverpool. The new president is Mr. A. E. Pridmore, of London.

The twenty-first annual report of the council was presented. This stated the Society to be in a very satisfactory condition. Since the last annual meeting there had been an unusually large number of applications for admission to membership, and 75 had been elected, while the register of students had been increased by 20. The total membership was now 703. During the past session a lady, Miss Annie Hall, of Cheltenham, was admitted to the register of students.

With regard to the bi-annual design competitions, the council pointed out that the proportion of students on the register who took advantage of them was very small; suggestions for popularizing them or for substituting some other scheme are invited.

In reference to the London Building Acts (Amendment) Bill, the council stated that a committee was still engaged on suggestions for amending the Acts upon the basis of the former Bill.

Extraoting Payment for Extraordinary Haulage.

The Institute of Builders had called the attention of the council to the practice of county and urban authorities in exacting payment of considerable sums of money for extraordinary traffic on roads over which materials were hauled for buildings, urging that as these charges added to the cost of the work and had eventually to be paid by the employer they should be arranged with the authorities beforehand. It was further pointed out that as there was no recognized system of charging, parties tendering did not compete on equal terms, as there was generally insufficient time before tendering to obtain definite information on this point.

Municipal Architects.

A memorandum had been issued by the council to every local authority in the Kingdom suggesting that where a qualified architect was not already permanently retained as an official of a local authority it was desirable that the assistance of a competent architect should be engaged for designing and carrying out the buildings, or where such permanent employment was not possible that the architectural work should be placed in the hands of a qualified local architect.

The Library and Reading-Room.

A considerable sum of money has been spent by the Society in the purchase of new books, and there is now the nucleus of a useful collection of modern works of a practical nature at the disposal of members, who are reminded that most of the books

may be borrowed, and that in the case of members residing at a distance the volumes can be sent by post. The reading-room has been found useful on several occasions by members (especially those from the country) as a rendezvous for clients. The room may be reserved by giving notice to the secretary.

Registration.

After referring to the Institute Bill, the council observed in regard to architects' registration that they proposed to continue their policy of watching and waiting until something definite had been arrived at by the senior body, and would resume their active propaganda when and as soon as the occasion required.

Examinations Abroad.

Consideration has been given to extending the scope of the Society's examinations by forming centres in various places abroad, and preliminary arrangements are already in hand for a centre at Bombay, while enquiries from South Africa are being dealt with.

Financial Position.

The financial position of the Society is sound. The council has added to the reserve fund, which now stands at £1,100, and could have done more in this direction, but that it believed to a reasonable extent the funds of the Society should, after providing for its proper working and the immediate interests of its members, be devoted to the objects for which the Society was founded, namely, the advancement of architectural art and practice generally, and the maintenance of the interests of the profession—hence its two contributions of £50 each to the *Gibbon v. Pease* appeal fund and to the building fund of the Architectural Association.

MR. GOODYEAR'S LECTURES ON ARCHITECTURAL REFINEMENTS.

MR. W. H. GOODYEAR, who has just come over from America, delivered last week the first of a series of lectures on architectural refinements at the Scottish National Portrait Gallery, Edinburgh, where the exhibition with which his name is associated is now being held. Mr. H. O. Tarbolton, president of the Edinburgh Architectural Association, presided. Mr. Goodyear commenced by a reference to the Cathedral of Pisa and its buildings, to which his attention had been given for the past twenty-five years. By the aid of lantern views he showed the variations which were to be found on the façade of the church on the horizontal and vertical building lines—variations which, he said, escaped general observation. He discussed the question whether these were due to subsidence or to other accidental causes, or whether they were intentional and intended to produce certain optical and pleasing illusions, possible by deviations from straight lines. He firmly held the view that the facts of the case of Pisa entirely precluded the theory of subsidence or accident, and argued that these "refinements" were the deliberate work of architects and builders. Such "refinements" took many forms, both inside and outside French and Italian cathedrals, but they were more numerous in the church of Pisa and St. Mark's, Venice, than in any others. In the elaborate arcaded façade of Pisa, for example, the first storey had a lean forward of 1 ft., the second a set-back of 6 ins., the third and fourth a lean forward of 1 ft. and the tenth of 1 ft. respectively, while those higher were perpendicular. These variations, many thought, were intended to give the façade an appearance of greater height than it really possessed. On the interior of churches various devices were used to correct the harsh perspective of straight lines or to make the interiors appear larger than they really were.

THE ARCHITECTURAL ASSOCIATION.

Mr. Andrew Oliver on the City Churches.

A MEETING of the Architectural Association was held on Friday evening at 18, Tufton Street, Westminster, the chair being occupied by Mr. Louis Ambler, vice-president.

The reinstatement of Mr. H. Chatfield Clarke was announced; also the following additional donations to the Building Fund:—

	£	s.	d.
H. Chatfield Clarke	-	-	10 10 0
H. Wigglesworth	-	-	5 5 0
F. Bisset	-	-	1 1 0
G. P. Bowie	-	-	1 1 0
R. J. Buck	-	-	1 1 0
G. Hubbard	-	-	1 1 0
C. Wontner Smith	-	-	1 1 0
J. Borrowman	-	-	0 10 6
S. Box	-	-	0 10 6
S. Chatfield Clarke	-	-	0 10 6
A. H. Fagg	-	-	0 10 6
I. T. Sifton	-	-	0 10 6
E. Howley Sim	-	-	0 10 6
A. H. Ryan-Tenison	-	-	0 10 6

Mr. Francis Hooper proposed and Mr. H. A. Satchell seconded the adoption of the council's report and balance sheet for the past session 1904-05, and the chairman proposed a vote of thanks to the Carpenters' Company for a donation of carpentry models to the Association's day and evening schools.

Mr. Andrew Oliver then read some "Notes on the Ecclesiastical Buildings of the City of London," illustrated by lantern views. The following is a comprehensive summary of the lecture:—

In dealing with the ecclesiastical buildings of the City of London it must not be forgotten that the edifices at present in existence form but a small portion of those that were originally constructed. But although the original edifices have so completely disappeared, yet we are able to reconstruct them, and thus set forth the glories of monastic London as it was in the palmy days of its ecclesiastical grandeur, the splendour of whose ruins can only be compared with those of Newark, Fountains and Glastonbury.

The Two Great Periods of Destruction.

The first great wave of destruction, not only in London but over the whole of England, took place in the reign of Henry VIII. and his successor, Edward VI., and it was at this period that the whole of the monastic edifices of the City were swept away. The second general destruction was the Great Fire of 1666, when not only did the few remnants of the monastic establishments utterly vanish, but nearly the whole of the churches of the City were overwhelmed.

The subject may be divided under the heads of (1) monasteries, (2) churches before 1666, (3) Wren's churches.

Monasteries.

The religious orders to which these belonged were the Benedictines, who had three nunneries—St. Helen's, Bishopsgate; Holywell, Shoreditch; and the Black Nuns, Clerkenwell. To the Carthusians belonged the Charter House; to the Cistercians the Abbey of Eastminster. To the Grey Friars or Franciscans belonged the monastery of the Grey Friars, Newgate; Christ's Hospital (where the Bluecoat School used to be) to the Blackfriars, or Dominicans; and, just outside the City, were the White Friars, or Carmelites. The Austin Canons possessed the greatest number of establishments—St. Bartholomew, Smithfield; St. Martin's-le-Grand, St. Mary of Bethlehem and St. Katherine of the Tower; the Priory of the Holy Trinity, Aldgate; and St. Mary Spital, Shoreditch; the Nuns of St. Clair, or the Minories—a minor order of the Franciscans, where the Minories now is. The Austin Friars had a house which was near Broad Street. The Preceptory of the Knights Templars was in Holborn, and later

at the Temple. The Knights of St. John, or the Hospitallers, were at Clerkenwell.

All that now remains of the foregoing is the chancel of St. Bartholomew, Smithfield, and part of the cloister of the church of St. Helen's, Bishopsgate, the nave of the church of the Austin Friars, part of the Charter House, the gateway, crypt and the nave of the Priory of St. John, Clerkenwell, and the Temple Church.

St. Martin's-le-Grand, 1056-1548.

This was the greatest of all the monastic edifices in the City, as well as being the most important. It was pulled down in 1548, and the General Post Office now stands upon the site.

Holy Trinity Priory.

This was founded in 1108. Norman was the first prior, and "he built the gate of Aldgate from the foundations." From a plan dated 1592 the dimensions of the church would appear to have been—length about 245ft., width 69ft., and across the transepts 120ft. The chapter-house site, and probably the walls, became St. James's Church, Duke's Place; Mitre Square occupies the site of the cloister; whilst Mitre Street passes right through the church and over the site of the high altar, and over the graves of the children of King Stephen.

Holywell Priory, Shoreditch.

This was founded in 1127, and the entrance was through a gateway which was standing in 1785. In the courtyard was the priory church, probably of late Norman date, with windows Early English and Decorated. The priory was suppressed in 1539. The whole site is now occupied by the Great Eastern Railway.

Blackfriars, 1176-1538.

This consisted of precincts, church and sanctuary, with four gates. The church, it would appear, was a very fine structure, about 66ft. in width by 230ft. in length, or rather larger than St. Saviour's, Southwark. There were two aisles, a chancel, a cloister 100ft. square, and a chapter-house to the west 44ft. by 22ft. New Inn now occupies the site of the first monastery.

The Greyfriars, or Franciscans (1225-1538)

occupied the site of the Bluecoat School, or Christ's Hospital. The monastery was founded in 1225 and the choir built in 1289. The nave and the other monastic buildings were erected later. The whole church was rebuilt and enlarged between 1306 and 1327. The plan shows some peculiarities. There were no projecting chapels, but the aisles were very wide, to allow chapels to be placed there. The nave was seven bays in length, with transepts and a central tower. The choir was also seven bays in length and along the centre was a row of tombs. The present church of Christ Church occupies part of the site of the choir.

Priory and Hospital of St. Mary of Bethlehem.

The Lunatic Hospital was removed here at the suppression, and afterwards to London Wall, and in 1814 to St. George's-in-the-Fields.

The Eastminster or St. Mary of Graces.

Of this once magnificent building no records are known as to what the buildings were.

Churches erected before 1666.

In the second division we find a complete sequence of architectural style from the Early Norman period to the middle of the seventeenth century.

The buildings may be classified under the periods as follows:—

The Norman Period.—St. John's Chapel in the Tower; St. Bartholomew, Smithfield; the crypt of Bow Church; the west end of All Hallow's, Barking; the Sacred Church of the Temple; and the crypt of St. John's, Clerkenwell.

The Early English Period.—St. Ethelburga, Bishopsgate.

The Decorated Period.—Great St. Helen's, the Austin Friars Church, Bishopsgate.

The Perpendicular Period.—St. Andrew Undershaft; St. Olave, Hart Street; and St. Giles, Cripplegate.

Transitional, Perpendicular and Renaissance.—St. Catherine Cree.

The Earliest Example

of ecclesiastical architecture in the City is the Chapel of St. John in the Tower. The exact date is somewhat uncertain. Gundolph, Bishop of Rochester, built the White Tower about 1178, so that this is probably the date of the chapel, or maybe a little later.

St. Bartholomew, Smithfield.

The Norman work on the chancel (what is now the nave) was executed by the founder Rahere and his successor between 1123 and 1174. The transepts, with the Early English work, were added during the ensuing fifty years, and possibly the nave, the site of which is at present occupied by the churchyard, and also the gateway. To the Perpendicular period belongs the range of clearstory windows and what is known as Prin. Bolton's pew and the tomb of the founder. The so-called pew is, in all probability, a watching loft, such as we find at St. Albans and other places. The clearstory windows in the apse are modern, and were the work of Sir Aston Webb. The Lady Chapel is of Early English date, and is entered from the ambulatory of the choir at the east end.

The Temple, 1185-1312.

The Knights Templars existed for about two hundred years, 1118-1312, and their first settlement was in Holborn, near Southampton Buildings. In 1180 they came to the present temple, which was consecrated five years later. The original church consisted of a round nave, the choir being added in 1240. The church consists of porch, a round nave and choir. The west doorway is Transitional Norman. The piers consist of Purbeck marble columns, with capitals, supporting pointed arches, over which is an arcade of intersecting semicircular arches. The clearstory windows above are round-headed; the choir, with nave and aisles, five bays in length. The vault is carried on marble shafts with richly-moulded capitals.

St. John's, Clerkenwell.

The earliest portion of the present chapel, now the crypt, was erected at the end of the eleventh century. West of this was situated a round church similar to the Temple Church, which was consecrated the same year, *i.e.*, 1185. The original chapel then became a crypt under the new church. The eastern end of the present crypt marks the extent of the Priory Church, and the crypt and present church represent the length of the choir.

Austin Friars.

The church, originally cruciform, containing a nave of bays, chancel, transept and central tower, was entirely destroyed, excepting the nave. The chancel extended as far as Broad Street, and the site is marked on the Ordnance map adjoining the chancel of the Church of St. Peter-le-Poer. It is now used by the Dutch Church.

The Charterhouse.

There is not much left of the old buildings, which were suppressed in 1537.

Great St. Helen's, Bishopsgate.

This was the church attached to the Benedictine nunnery. It consisted of a north aisle, or what is termed the nuns' aisle. This was entered on the north side from the cloisters, the doorway of which is still to be seen, together with a curious squint. This aisle was separated by a screen from the parochial nave, which has a transept and ten eastern chapels. The establishment, with

refectory, chapter-house and other buildings was practically complete until the end of the eighteenth century, when it was bought by the Leathersellers, and their present hall and St. Helen's Place occupy the site.

St. Ethelburga.

Before the suppression of the monasteries this church was attached to that of St. Helen. It consists of a nave, chancel and south aisle, with clearstory. The porch shows remains of tenth-century work.

All Hallow's, Barking.

was formerly attached to Barking Abbey. It consists of nave, chancel, aisles and clearstory. The piers at the west end are of Norman date, and the east end belongs to the Perpendicular period. Richard I. added a chapel on the north side.

St. Andrew Undershaft.

The church dates from the early part of the tenth century. The northern portion and part of the south aisle were built at the expense of Sir Stephen Jennings, Lord Mayor, 1508, and the church was completed in 1523 by William Fitzwilliam. It consists of a nave and aisles, clearstory, and a lofty tower. The most interesting monument is that of John Stow, the earliest writer upon London. The name Undershaft is due to the fact that the church stood originally under the Maypole or shaft.

St. Giles, Cripplegate.

The cripples had nothing to do with the name. The church is the successor of one erected about twenty-four years after the Conquest. It was partially rebuilt after a fire in 1545. Perhaps the most interesting person born in Cripplegate was John Milton. Foxe, Frobisher and Cromwell were buried here. In the churchyard is a part of one of the old bastions of the Roman wall. The naves, which formerly hid the north side, have been taken down and a statue of Milton has been erected on the site. The church, in the Perpendicular style, consists of nave, chancel and aisles. The steeple contains twelve bells.

Churches erected after 1666.

The series of buildings which followed the Great Fire, and which were the work of Sir Christopher Wren, were different in every respect from those which had been erected at a previous period. Up to that date the church architecture of the City resembled in the style, the detail and general arrangement that which was usually to be found in the architecture of the country, but with the advent of Wren a new style was created, and one belonging solely to the City of London. There is no city which shows such a great variety in its towers and spires, or in its church architecture, and all of this may be said to be due to the genius of one man. As may be supposed, there is considerable generalness in the design of some of the examples; this, however, may not be the fault of the architect, but through circumstances over which he may have had no control. Yet even if we allow this to be the case, one cannot fail to be struck with the beauty of many of the designs and of their adaptability to surroundings. They show not only great power in design, but a marvellous grasp of constructive detail. Hardly any one of them is constructed in a similar manner to the others.

St. Paul's.

The present cathedral of St. Paul, the grandest of Sir Christopher Wren's works, is the third building which has been erected. The first cathedral is said to have been founded in 597, and destroyed in 1087 by fire. In this latter year a new cathedral was built in the Norman style. In the year 1240 the choir was rebuilt and enlarged by being extended over the site of the Church of St. Faith. The tower and steeple were

completed in 1221, and the steeple was burnt in 1561, and never rebuilt. It is said that part of the stone intended for the rebuilding of St. Paul's steeple was given by Charles I. to the Duke of Buckingham to use in the building of Buckingham House. Some of the present watertower is built out of this stone originally intended for St. Paul's. The cathedral was partly repaired by Inigo Jones, who added the classic porch or narthex at the west end. Sir Christopher Wren was called in, and he proposed to take down the Gothic arches and substitute round ones of a neat Classic style and to erect a dome in place of the tower. These works were all stopped by the Great Fire, and various attempts made to patch the edifice, but, being futile, there came Wren's opportunity for the present building.

The Rebuilt Churches.

In the Harly MSS., 4941 (British Museum), there are three schemes for the rebuilding of the destroyed churches. The number first proposed was thirty-nine, but in the final arrangement this was altered to fifty churches, St. Paul's not being included, as it was considered at the time the matter was brought forward that the cathedral could be made suitable for public worship. In addition to these there was another batch which were rebuilt in the eighteenth century, about a dozen in all, by Nicholas Hawksmoor, who rebuilt St. Mary Woolnoth; George Dance, All Hallows-on-the-Wall; and churches by James Gold, Cockerell and others. None of these, with the exception of St. Mary Woolnoth, are of much interest architecturally or otherwise, so it will not be necessary to refer to them more fully.

In describing the churches which were erected by Wren it will be impossible to give a detailed account of the buildings. All that can be done will be to enumerate a few of the leading examples.

Types of Wren's Churches.

In the churches which Sir Christopher Wren erected we find the following types:—

The basilica—i.e., a parallelogram divided by arches—at St. Michael, Cornhill.

A nave, and north and south aisles, St. Mary-le-Bow.

At All Hallows the Great (now destroyed) a nave with only a north aisle.

St. Nicholas Cole Abbey shows a nave only, and at St. Stephen, Walbrook, we find the dome the leading feature of the interior.

With regard to the planning of the churches which were rebuilt, in many examples they follow upon the old lines, and even occupy the original sites of the old foundations. In some instances the old walls have been re-used, or re-faced, and many of the towers still retain the work of an earlier period.

Although Sir Christopher Wren was, to a great extent, tied by the old boundaries, yet he departed in many instances from the original ground plan and arrangement, and erected practically a new building.

Before this period most churches had followed one particular plan—i.e., a nave and aisles, separated by piers and columns.

A structural chancel was a rare feature in the London churches, most of which had been rebuilt in the fifteenth century without a chancel, the aisles being continued to the east end, and a screen being used to cut off the portion which was used as a chancel.

Towers and Spires.

The towers and spires of Sir Christopher Wren may be placed in four divisions:—(1) Towers; (2) towers and spires; (3) towers with lanthorns; (4) towers surmounted by a dome.

The first division, towers, contains one-half of the fifty examples which were erected originally. In many instances it is possible that the original walls of the structure were

left or repaired, and all that was done would be to add to the original structure. The additions chiefly consisted of a parapet wall, and sometimes we find stone vases, obelisks, or other architectural features at the angles, and in other cases round windows or openings inserted, and the walls refaced with stonework.

Of spires there are two kinds, namely, "stone spires" and "wooden structures covered with lead." Among the first was placed the destroyed spire of St. Antholin, which may be said to have been a true spire and constructed in the Gothic style; St. Bride, Fleet Street; St. Mary-le-Bow; St. Dunstan's-in-the-East (leaden spire); St. Martin's, Ludgate; St. Edmund, Lombard Street.

Towers with lanthorns, as St. Stephen, Walbrook; St. James, Garlickhithe; St. Michael, Paternoster.

Towers with cupolas in lead—St. Magnus, London Bridge; St. Peter, Cornhill; and St. Peter, Benetfink, destroyed.

A stone cupola was at St. Mary Magdalene, Old Fish Street, now destroyed.

Discussion.

Mr. J. D. Crace, in proposing a vote of thanks to Mr. Oliver, mentioned that on one occasion he happened to go into St. Bartholomew's, and thinking he saw traces of colouring in the Norman arches he scraped the surface and discovered a complete system of Norman colouring. Round churches had been mentioned. There were equally interesting examples at Northampton and Cambridge. With regard to Old St. Paul's, the spire, a wooden one, was the highest in Europe, and must have been a very conspicuous object. The origin of the name of Bow Church was connected with the vaulting beneath it, which was, in fact, the Court of Arches.

Mr. Hugh Stannus, Mr. J. Johnson and Mr. C. Lynam also spoke.

Mr. Banister Fletcher said that Wren had to deal with some extraordinary sites, but even in regard to planning alone his churches were worthy of study.

The chairman suggested that it would be of great service to them and to future students if members combined to measure and draw all the churches that had not been so done, and that these should be published in the Sketch Book.

It was announced that the next meeting of the Association would be held on November 17th, when Mr. J. A. Gotch would read a paper on "Old Manor Houses" at 7.30 p.m.

New Members.

The following have been elected members of the Architectural Association:—

R. G. Schute, A. D. Mallandaine, E. S. Hall, H. T. Barnard, D. L. Solomon, D. G. Hake, W. H. Crauford, F. J. McC. Maxwell, F. C. W. Dakers, W. H. Wilson, H. V. Love, L. G. H. McCredie, A. E. Harris, A. W. Hall, R. H. Cock, W. E. R. Randall, Junr., C. J. Bathurst, A. MacConnell, R. P. Oglesby, T. F. W. Rolfe, R. W. Fry, H. Dore, R. S. Prideaux, E. J. W. Whitehead, A. T. With, A. E. Vey, W. I. Keir, C. E. Fellowes Prynne, W. E. Trent, H. A. Ross, H. W. Brittan, E. J. Haslehurst, F. D. Danvers, R. Pierce, W. G. Gale, J. Newton, C. W. Denton, W. H. Huckvale, S. P. Schooling, T. M. Ellis, R. W. Cable, L. Keir-Hett, R. O. Bridger, D. G. Shrubsall, R. Knowles, P. J. Waldrum, J. G. de Parada, W. B. Jones, E. Newman, A. G. Blackford, W. Cook, Junr., H. M. Robertson, B. F. Matthews, T. H. Barrow, L. S. Wood, E. E. Morgan, O. R. Davis, W. H. Louw, T. M. Swales, A. R. C. Eaton, F. S. Jasper, G. T. Power, G. Sander-son, F. H. Knight, W. J. Jones, G. C. Wilson, F. G. Troup, C. D. Carus Wilson, H. Battiscombe, P. A. Tilden, A. L. Levy, V. Rienaeker.

Correspondence.

The Estimating Clerk.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have read your leader, and think the estimating clerk should possess practical knowledge, but, as manager, in many instances, would not his high salary, in addition to that of the foreman of works, mean ruin to the employer? I think he would be better employed in ascertaining the market prices of materials and the cost of producing all kinds of work. I would like to point out to "R. E. M.," who has so ably supported your suggestions, that a low tender is sometimes the result of misconception.—Yours truly,

WOKING. FREDK. AYLOTT.

[Our correspondent looks at the matter from a reasonable standpoint as regards a small contractor's business. In such circumstances, we admit, the business is not large enough to support a highly efficient manager-estimator, and the contractor himself is the one who must undertake the work. Our remarks were directed to larger businesses where the contractor is so busy that the estimating clerk is a person of responsibility. Yet it must be admitted that many small contractors are neither by education nor training able to direct their business with efficiency, and to effect improvements; the estimating and the prime-cost clerks and manager-secretary-accountant are the usual persons that run the business, each more or less independently, while the contractor has not the ability to co-ordinate and supervise their work, but deals with the outdoor staff (the foremen and workmen). These latter are not particularly inventive, and as they do not watch prime costs and organization from the office, are not so competent to build up a business and strengthen weak points. As regards low tenders being sometimes submitted under misconceptions, this is no doubt so; mistakes in estimating due to carelessness and want of information are far too frequent; but low tenders are more often due to undercutting.—Ed. B. J.]

Damp Walls.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—With reference to an enquiry on p. 221 of your issue for last week, respecting the condensation of moisture upon paintings on the walls of a staircase, surely the answer is wrong. The walls and the air should be kept warm, not cold. Condensation takes place on a cold surface but not on a warm one. Varnish is not cold, but, being smooth and impermeable, offers less surface to the air than a rougher material; and being also a bad conductor of heat, when there is a rise in the temperature of air laden with moisture, that air becomes cooled by contact with the wall, and being no longer capable of holding so much water, the latter is deposited on the colder surface. Of course, plastering on battens may be applied outside, but the inference which would be drawn from the last words of the reply is that it is recommended inside, which would block out the paintings on the wall. Warming should be done by any other means than gas, as the combustion of gas evolves a considerable amount of water vapour. The surfaces under the lower floors should be looked to; the earth should be covered with smoothed concrete to prevent the damp air being drawn up into the house.—Yours truly,

HACKNEY.

A. H.

[The warmer air is, the more moisture will it absorb and sustain; of course when it comes in contact with a colder surface it is cooled and rids itself of the superabundant moisture, depositing it upon the surface. It is the difference in temperature which is responsible, and if the air in the staircase were kept practically at the same temperature as outside—which could only be done

by excluding the air from the house and giving plenty of ventilation in the staircase—the air, being at a low temperature, would not take up any further moisture, and being at the same temperature as the outside air (to which the walls would conform) would not give up any of the moisture that was carried by the outside air at that regular temperature. If, on the other hand, the air is warmed, it will absorb moisture only to deposit it on a surface colder than itself, and therefore unless the staircase walls were insulated so as to be warmed to approximately the same temperature as the inside air, the trouble would still continue. Surely the inference to be drawn from the suggested plastering on battens in order to insulate the walls was not that this should be done internally. Our correspondent at all events drew the correct inference, for he shows he understood our meaning. The statement as to the amount of water vapour from gas is correct, but in this case it did not appear that gas heating was the trouble. The last suggestion of our correspondent may offer some explanation of the dampness, but air can gain a sufficient amount of moisture from other sources to cause trouble.—Ed. B. J.]

A Word of Warning about Reinforced Concrete.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In view of the strong tendency displayed in many quarters to employ reinforced concrete for almost every purpose, a word of warning to some at least of the younger professional men will not perhaps be out of place.

With his strong conservative bent, the Englishman went on for years ignoring what was being done on the Continent and elsewhere with a combination of steel and concrete, till one day it seemed suddenly to dawn upon him that such a form of construction was perhaps feasible. Then he went to the other extreme. Visions of concrete, at perhaps 18s. a yard, very thin, with a few pieces of stout wire stuck through it, arose before him as a substitute for more legitimate construction, and these visions are still enjoyed by many—especially by laymen with would-be-scientific minds.

Now, as a matter of fact, the economy of using reinforced concrete as a building material is often a moot point. For instance, the gins. by gins. reinforced beam illustrated in your last issue would cost more than £1, while a rolled steel joist to do the same work could be obtained for less than 15s.; moreover, the coefficient of risk that reinforced concrete entails, owing to bad workmanship, is very high, whereas with a rolled steel joist the risk is practically nil. The concrete must form a homogeneous whole; it must be in perfect contact with the steel; and the cement must not swell in setting, or it will set up a tension in the steel before it is even loaded with the weight it has to carry. To obtain concrete of this homogeneous quality it is necessary to carefully grade the shingle in a way that an old-fashioned contractor would call "playing shops"; and then it has to be carefully measured in the proportions that are found to produce the best results with the particular grades of shingle and sand being used. Concrete made in the old-fashioned way by mixing two bags of cement to about a cartload of "the best I can get" kind of shingle hardly belongs to the same family as that necessary for reinforced work. The equally important necessity of perfect contact between concrete and steel is only obtained by "elbow grease," the concrete being carefully punned with small punners until the required adhesion can be fairly relied on; and it is evident that this will only be done well when there is a supervision almost approaching to that of the sentry over the convict.

If, then, after carefully considering the matter, it is found that reinforced concrete is cheaper or more efficient, by all means let it be used; but let it be really for one or other of these reasons that we adopt it, and not because it is the latest gilguy.—Yours truly,

A FELLOW OF THE
SURVEYORS' INSTITUTION.

Sand Lime Bricks.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—With reference to the enquiry and answer about patent bricks on p. 220 of your issue for last week, you are quite right in assuming that our system is the sand-lime process, but we do not understand your remarks about the bricks having the usual "defects of shortness and want of resistance to fire, crumbling under heat and water." As a matter of fact, these bricks when made are practically blocks of pure silicate of lime, and have been used with great satisfaction in Liverpool for lining copper furnaces, which have been thoroughly tested as regards to heat and cold. In one instance the bricks were frozen and thawed out twenty-eight times in succession without showing any flaw whatsoever. As a proof of their being of excellent quality and equal in all respects to the very best facing bricks, we have been favoured with an order for about a quarter of a million of these bricks for the new Liverpool Cotton Exchange, and a great many of them are now laid in the wall. Within the near vicinity your Glasgow querist "G." can see plenty of houses, some occupied and some in course of construction, built with these bricks; their appearance and weather-resisting qualities have been approved by all. In stating these facts we are only fair to ourselves, as we believe we are the only large commercial plant making headway in this industry, so far, in the United Kingdom.—Yours truly,

THE HYDRAULIC BRICK AND
STONE CO., LTD.

18, WATER STREET, LIVERPOOL.

Architects Boycotted by Builders.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Are you not just a little too severe in publishing in a journal which is ostensibly a builders' journal such criticism of the above as appeared in your issue for last week? I am not myself a builder, yet I have in past years moved amongst them very considerably. Builders require protection in the legitimate pursuit of their calling equally with the architect. Ruinous competition cannot be good even for a builder, yet it obtains to-day, and is largely brought about by the unfair tactics of those who employ them. How often does a contractor stand or fall by the tender he sends in? Not so often as the public imagine; and most architects know it. When tenders are opened there is a "reasoning together" on the part of proprietor and architect, and after a shuffling process the work is given out—but not necessarily to the contractor sending in the lowest tender. This innocent process has in time developed into abuse, and in turn has led the builders to protect themselves by combination. True they combine for many other purposes than the improvement of prices; but, after all, better prices is the pivot upon which all other reforms work. You refer to the Institute of Builders and the Master Builders' Association of Great Britain and Ireland, and you consider it their duty to excommunicate the Yarmouth branch of their Federation. To carry such an issue to its logical conclusion would be to exterminate themselves, for their fundamentals are the very essence of the conduct of the Yarmouth builders, who, in declining to tender for local work against outsiders, only in imagination are doing such an erroneous thing as the members of the Yarmouth Board

of Guardians allege against them. Were the Yarmouth builders to organize themselves under the dictates of the Master-Builders' Federation of Great Britain, they would have nothing to fear from their board of guardians.—Yours truly,
HULL. FEDERATION.

[For our correspondent to retort that there are architects as well as builders who have moral obtuseness in business is neither argument nor excuse. The title of this journal is intended to be taken in the widest sense, and not restricted to the support of contractors right or wrong. We never fear to uphold honest dealing, feeling assured that it is to the true interests of the building trade, as of any other industry. Our remarks were directed to a particular incident, and our correspondent is mistaken in trying to deal with it apart from the merits of this particular case. The secretary of the Yarmouth Master Builders' Protection Association has written to the local press replying to the statements at the guardians' meeting, and he admits that in the Association's rules there is the following clause: "That no member of this Association shall give a price in competition with any non-society builder in the district." The secretary thinks the architect was perfectly justified in refusing to give particulars of the work to an individual who was a non-society man, as he "knew the members of the society could not tender with him." He goes on to say, in reference to a member of the guardians, "Does he think that the man referred to would have sent in a lower tender than those sent in by the builders who tendered for the work?" He denies that there is a ring, as everyone is too hungry for work. This may be, but apparently the Association is trying to form a ring. A local correspondent alleges that on several occasions the Association has refused to admit to membership men who have superior claims to some in the august body. The attempts of trades-unions to prevent workmen who are not members from obtaining a living has been universally condemned by contractors. The Yarmouth builders are now trying similarly to interfere with the liberty of the subject.—ED. B. J.]

ESTIMATES.

AT last week's opening meeting of the session of the Ordained Surveyors Students' Society, Edinburgh (Mr. A. Cameron, president, in the chair), Mr. Forrest H. Lightbody, F.R.S.E., read a paper on "Estimates of Probable Costs," in the course of which he referred to the confusion which often existed in the public mind between estimates of probable cost and actual tenders. This, he thought, was in some degree attributable to the unfortunate use of the word "estimates" in the sense of "tenders." When actual tenders were wanted a detailed schedule of quantities of all the works necessary to complete the building was prepared by the surveyor. It might take weeks or even months to prepare these schedules. They were then sent out to the contractors, and formed the basis on which the actual tenders were calculated. The amounts of these tenders usually varied very much. In some cases the highest offer would be as much as 50 per cent. above the lowest. In estimating a probable cost the surveyor was not, of course, in possession of the detailed schedules of quantities, and had to resort either to the method of pricing the building at a rate per cube foot or other unit derived from his experience of other buildings, or to take out the quantities in a rough way and price them—to perform in one day, perhaps, what it might take six weeks to do accurately when he came afterwards to prepare the schedules of quantities. Yet he was expected to produce a result within smaller limits of variation than were usually found in the

case of tenders by contractors based upon accurate measurements. It was obvious that the greater their experience of the cost of other buildings the better equipped they would be to make an estimate of the probable cost of any class of building, and he strongly recommended students to record their experience in a careful and systematic way.

Builders' Notes.

For building Almshouses and a Blind Asylum at Painswick, Stroud, £100,000 has been bequeathed by the Gyde family.

Fair Wages Clause refused.—The Walsall Guardians refused last week to accede to a request from the Building Trades' Federation for a fair wages clause to be inserted in all building contracts.

A Tender for £45,000 for the erection of public baths and washhouses has been practically accepted by the Hammersmith Borough Council in order to provide work for the unemployed.

Messrs. Mellowes & Co., Ltd., of Corporation Street, Sheffield, have secured the order for glazing, on their "Eclipse" patent imperishable system, the roofs of the following buildings:—College goods sheds, North British Railways Co.; Wigan markets and car-sheds; Swadlincote car-sheds; extensions to works of Cammell, Laird & Co., Ltd., Sheffield; Ransome & Rapier, Ltd., Ipswich; Milner's safe works, Liverpool; National Gas Engine Co., Ltd., Ashton-under-Lyne; Hadfield's Steel Foundry Co., Ltd., Sheffield; Metropolitan Amalgamated Railway Carriage and Wagon Co., Ltd., Sabley; Buckley's Bleachery, Whitefield; &c.

Hollymoor Asylum, Birmingham: A saving of £15,874.—The Lunatic Asylums Committee of Visitors, Birmingham, report that on the building of the new asylum at Hollymoor there has been a saving of £15,874 on the builder's estimate, which was for £207,256, while the actual cost has been £191,382. The amount authorized for engineers' and electricians' work was £15,000 and the actual expenditure £14,739—a saving of £261. The preparation of the site was estimated to cost £9,250 and the actual cost was £9,085—a saving of £165. The railway sidings were estimated to cost £3,731 and they actually cost £3,462—a saving of £269. The amount authorized for architects and clerk of works was £12,500, the actual expenditure £12,244—a saving of £256. Only in "incidental expenses" was the estimate exceeded. The authorized amount for these was £1,513, whereas £2,842 was spent—an increase of £1,329.

An Important Amalgamation has been ratified recently in the purchase of the well-known business of the Darley Dale and District Stone Co., Ltd., of Darley Dale, near Matlock, by Messrs. J. Hodson & Son, Ltd., quarry-owners, general stone merchants and masonry contractors, of Nottingham. The works, adjoining the Darley Dale station on the Midland main line, are equipped with up-to-date stoneworking plant and include a large quantity of all descriptions of Derbyshire stone; also the well-known Hopton Wood stone and Yorkshire of several qualities. Orders of considerable magnitude can be executed promptly from these works, and when executed in conjunction with the thoroughly equipped plant at Nottingham can meet any demand. The stock is being rapidly cleared at very low prices, and all readers who are interested should communicate with Messrs. Hodson, who will forward particulars (and samples if necessary) on receipt of a postcard.

Law Cases.

Architect and Carnegie Dunfermline Trust.—The action has been settled in which Mr. T. H. Mawson, garden architect, of Windermere and London, sued the Dunfermline Carnegie Trustees for £3,101 for services said to have been rendered in connection with the carrying out of the Trust. The defendants said that Mr. Mawson exceeded his instructions by preparing a scheme which included the construction of tramways and boulevards and the displacement of a large proportion of the population of the town. They offered him £300 in full settlement of his services and outlay. Mr. Mawson has now received £527, and the action has been taken out of court.

Architects' Fees for Plans supplied but not carried out.—At the Conway County Court recently Mr. John Hughes, borough surveyor of Ruthin, sued Mr. F. Roberts, of Colwyn Bay, for the sum of five guineas, representing half the fee he would have charged for a set of designs for semi-detached houses, with which he supplied the defendant, if the defendant had built the houses from them. The plaintiff supplied the drawings when he was in practice as an architect at Colwyn Bay before taking up his duties as borough surveyor at Ruthin. After receiving the first set of drawings the defendant was stated to have changed his mind and to have asked for drawings for a single house, which Mr. Hughes supplied, but which were not acted upon, as the defendant ultimately employed another firm of architects.—The judge held that plaintiff was entitled to the amount claimed. Judgment accordingly, with costs.

A Building Contract.—A novel point was raised in a county-court case at Stockton last week. A Middlesbrough builder and contractor named Price sued a Stockton joiner named Mawood for £65 12s., the balance of a contract to build eight houses. The contract was a verbal one, but subsequently Mawood asked Price to put it into writing. Price could neither read nor write, and a man named Earnshaw was engaged to put the contract into writing. Earnshaw made a mistake, and Price did not find out the error until he went for the balance of the contract money. For the defence it was contended that Price could not succeed, but must take action for the rectification of the contract, and then it would have to be shown that the mistake was a mutual one. Earnshaw said that when he made out the contract he confused two classes of houses, and quoted £83 instead of £93. Judgment was given for Mawood, his Honour remarking that the action by Price was not that of a man who had made a mistake in a contract.

What Notice a Clerk of Works should be given.—At the City of London Court recently, before his Honour Judge Lumley Smith, K.C., Mr. W. H. Hudson, clerk of works, Kilburn, claimed £48 12s. 8d. from the governors of Leys School, Cambridge, for three months' wages in lieu of notice. Mr. S. P. J. Merlin appeared for the plaintiff and Mr. Chester Jones for the defendants. Plaintiff said he was engaged by the defendants as clerk of works, at 3½ guineas a week, to look after the erection of their new chapel at Cambridge. He was told that the work would last for a year, and accordingly he took his family down to Cambridge. After he had worked for defendants for five or six weeks he was dismissed on a week's notice. Now he demanded three months' salary, as that was the usual custom of the trade. Defendants said that a week's notice was quite sufficient, and they called the secretary of the Clerks of Works' Association in support of their case, who admitted that three months was given on large jobs. The judge said the plaintiff was entitled to a month's notice, and found for the plaintiff for eleven guineas, with costs.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

President's Address.

MR. E. HOLMES delivered his presidential address to the Sheffield Society of Architects and Surveyors on Thursday last. Speaking of housing in Sheffield, he said the question was intimately connected with the proposed new by-laws, and the council of the Society would closely bear that in mind when they were approached by the City Council upon the subject, as they would be in due course. He advised younger members especially to take up seriously the matter of cheap sanitary cottages. Referring to the educational facilities provided by the Society, he said that these had not been taken advantage of by the younger members to anything like the extent they should have been. During the session 1903 and 1904, out of three competitions only two were awarded, the essays in the other not being considered of sufficient worth to merit recognition; whilst during the session 1904 and 1905, out of four competitions, the prize was only awarded in one case; in one of the others the work submitted was not worthy of an award; and in the remaining two there was no response. With regard to registration he observed that it was not the wish of anyone that a mere technicality should qualify or disqualify anyone from practising as an architect, but the members felt that as so many questions of sanitation and healthy living were involved in the knowledge of architecture, some system of registration involving qualification by examination was absolutely necessary.

Mr. Winder in his address last year alluded to the necessity for the consolidation of local and other Acts of Parliament relating to new streets and buildings: and Mr. Holmes said he had always been strongly of this opinion.

They were all glad that the law as to right of light had been to some extent defined by a recent decision, but it was still in a most unsatisfactory position, and property owners who wished to re-erect buildings in a large town were liable to be subject to actions which were, many of them, neither more nor less than blackmail. The Society should consider in what way the law could be amended and defined, and at the same time they should resolve that in the course of their practice they would not support a client in any action merely for the sake of squeezing money out of an adjoining owner where no real nuisance was caused.

OUR PLATES.

THE Church of St. Erkenwald, at South-end-on-Sea, comprises a nave of four bays, with a north aisle and a chancel of two bays. Only the latter and a portion of the nave is being built at present. The walls are of stock bricks plastered internally with a view to their being decoratively painted at some future time. The architect is Mr. Walter J. Tapper, of London. The portion of the church so far completed was opened for service about a month ago.

Competitions.

New Drill Hall, Bury.—This competition has been decided as follows:—First premium, Mr. A. Hopkinson, Bury; second, Mr. G. H. Willoughby, F.R.I.B.A., Manchester. The estimated outlay will be about £10,000.

Secondary School for Girls.—A scheme has been approved for the erection of a secondary school for 500 girls on the site immediately behind the municipal secondary school in Wintworth Street, Manchester, and a competition among Manchester architects is to be held.

Keystones.

A new Workhouse Infirmary at Exeter was opened last week. It provides for 156 beds, and has cost £16,000. Mr. R. M. Challice is the architect.

The Church of St. Columba, Drumcondra, was dedicated last week by the Archbishop of Dublin. Mr. Ashlin and Mr. Coleman were the architects.

A Valuable Architectural Library, gathered together by the late Mr. George Henderson, architect, of Edinburgh, is to be sold by auction within the next week.

Higher than the Eiffel Tower. — The Weber Tower which is proposed to be built in New York will be 1,250ft. high. It is to be of steel and concrete, with balconies at various heights. Eight lifts will be installed.

Tramways over Blackfriars Bridge. — At last week's meeting the Court of Common Council decided to apply to Parliament for powers to widen Blackfriars Bridge in order to allow tramways to run over it, or, as an alternative scheme, to build a new bridge.

Society of Architects: New President and Council. — The officers and members of council of the Society of Architects for the year 1905-06 are as follows:—*President*, Mr. A. E. Pridmore (London); *vice-presidents*, Messrs. G. A. T. Middleton (London) and R. F. Vallance (Mansfield); *council*, Messrs. E. C. Beaumont (London), G. E. Bond (Rochester), B. D. Cancellor (Winchester), J. W. Dyson (Newcastle-on-Tyne), E. M. Leest (Devonport), C. H. Mead (London), D. Morgan (Cardiff), T. G. Price (Birmingham), T. R. Richards (London), A. Scott (Dublin), W. Scott-Deakin (Shrewsbury) and T. F. Tickner (Coventry).

At Childwall Parish Church a new north aisle, transept, side chapel and chancel aisle are being added at an estimated cost of £5,000. The architects are Messrs. J. Francis & S. W. Doyle, and the builders Messrs. Roberts & Robinson, Ltd., both of Liverpool. Prior to the laying of the foundation-stone last week a bottle was inserted containing plans showing the church at various stages of its history (one being that of the original church as it existed in 1767); also a set of plans showing the present alterations. The new work has been entered upon in consequence of the arches on the north side of the nave, erected in 1832, gradually showing signs of displacement and becoming unsafe.

Proposed new Streets through Bloomsbury. — A committee of the Holborn Borough Council had before them last week a scheme for constructing new streets in Bloomsbury, proposed by the Duke of Bedford. From Montague Place to Torrington Square it is proposed to form a street 130ft. wide (30ft. wider than Kingsway), and to form another new street (40ft. wide) parallel with Gower Street, between that thoroughfare and Torrington Square, extending from Montague Place to Euston Road. The scheme makes provision for the extension of the British Museum northwards, giving it a frontage in Montague Place.

An Exhibition of Decorative Architecture in Russia will be held during April and May next year in the Michael Riding School at St. Petersburg. The exhibition is being arranged by the Russian Society of Civil Engineers, and both Russian and foreign exhibits will be received. The exhibition is intended to furnish a complete and systematic record of the present condition of building in all its branches, and the exhibits will be distributed in seven sections, namely:—(1) Building materials and their application; (2) various trades and industries allied to building; (3) sanitary architecture; (4) fire-precautionary arrangements, (5) electro-

technology in its application to building; (6) artistic decoration of dwellings and buildings within and without, and (7) special literature and text-books. It will probably be in the interests of many British firms to exhibit building materials, &c., as there is a considerable field in Russia for commerce in this direction. Full particulars may be obtained from the official representative of the exhibition in Great Britain, Dr. Paul Dvorkovitz, 45, St. Mary Axe, E.C.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:—

A projecting pilaster between Nos. 58 and 59, Upper Street, Islington, on the application of F. Sage & Co., Ltd., on behalf of Jones & Sons. (*Consent.*)

Detached houses on the east side of Mycenæ Road, Westcombe Park Road, Greenwich, on the application of Crickmay & Heath on behalf of W. C. Johnson. (*Consent.*)

A projecting clock at the Royal Victoria Hall, Waterloo Road, Lambeth, on the application of J. Walker, Ltd. (*Consent.*)

An iron and glass conservatory at the first-floor level in front of "Keith House," Bayswater Road, Paddington, on the application of E. C. Macpherson on behalf of Sir Clifton Robinson. (*Consent.*)

A projecting balcony at No. 27, Maddox Street, St. George, Hanover Square, on the application of E. K. Purchase. (*Consent.*)

Porches to ten houses on the west side of Luttrell Street, Putney, on application of E. H. Wallis & Co. (*Consent.*)

An extension of the periods within which the erection of an addition, with a projecting portion, to the Westminster Technical Institute, Vincent Square, Westminster, was required to be commenced and completed on the application of P. N. Ginhams. (*Consent.*)

Consent to the erection of buildings on a site abutting upon the south side of Clapham Park Road and the east side of Park Hill, Clapham, on the application of the Council of the Metropolitan Borough of Wandsworth. (*Consent.*)

A one-storey office building on the south-west side of Holloway Road, Islington, on the application of V. F. V. de Brauwere on behalf of H. E. Butcher. (*Refusal.*)

Buildings on a site abutting upon the east side of Urswick Road, south side of Lesbia Road and north side of College Avenue, Hackney, on the application of J. G. Tewson on behalf of D. Burnett. (*Refusal.*)

One-storey shops on part of the forecourts of Nos. 29 and 31, Beacon Road, Hither Green, Lewisham, on the application of H. Kent. (*Refusal.*)

A building on the site of the tramways depot on the north-eastern side of Warters Road, next Camden Road, Islington, with external walls at less than the prescribed distance from the centre of the roadway of Warters Road, on the application of E. J. Edwards on behalf of the Highways Committee of the Council. (*Consent.*)

Buildings upon a site abutting upon the southern side of Fulham Road, western side of Fulham Park Road and eastern side of Landridge Road, on the application of Withers & Meredith on behalf of Spencer, Santo & Co. (*Refusal.*)

A cycle and tool shed at No. 38, Doneraile Street, Fulham, to abut upon Woodlawn Road, on the application of C. Botterill on behalf of G. Williams. (*Refusal.*)

An iron shed on a site abutting upon the north side of Lavington Street and south side of Farnham Place, Southwark, with the forecourt boundary at less than the prescribed distance from the centre of the roadway of Farnham Place, on the application of F. Wheeler & Son on behalf of Measures Brothers, Ltd. (*Consent.*)

A deviation from the plans approved on May 10th, 1904, for the rebuilding of Nos. 85 and 86, Jermyn Street, and Nos. 10 and 11, Ormond Yard, St. James, so far as relates to the erection of small buildings in the yard at the rear of the Waterloo Hotel, on the application of G. D. Martin. (*Consent.*)

To waive the provision of the air-duct shown on the first-floor plan and back elevation, dated September 27th, 1905 (Registered No. S.A. 32187), as to be provided at the first-floor level of the premises. (*Refusal.*)

A modification of the provisions of that section with regard to open spaces about buildings so far as relates to the proposed erection of St. Stephen's Vicarage, St. Stephen's Square, Southwark, on the application of J. W. Rhodes on behalf of the Rev. W. Dodge. (*Refusal.*)

The retention of a water-closet building and the alteration and reconstruction into a dwelling-house of a stable building at the rear of the "Duke of Clarence" public-house, No. 181, Camberwell Road, Camberwell, on the application of F. J. Eedle & Meyers on behalf of A. E. Garard. (*Consent.*)

Alterations at No. 7, Noel Street, Soho, on the application of G. C. Lambert. (*Refusal.*)

Blocks of intended dwelling-houses to be inhabited by persons of the working class on a site on the southern side of Adelina Grove, Mile End, on the application of W. E. H. Crawley, of No. 23, Victoria Park Road, London, N.E., on behalf of the Mercers' Company. (*Consent.*)

Means of escape in case of fire on the seventh (top) storey of Nos. 1 and 1A, Cockspur Street, Strand, on the application of H. Tanner, junr. (*Consent.*)

THE HEATING OF SCHOOLS IN AMERICA.

English Engineer's Inspection and Conclusions.

AT a meeting of the Institution of Heating and Ventilating Engineers (Incorporated) held last week at the Institution of Mechanical Engineers, Westminster, Mr. J. D. Sutcliffe read a paper on "The Progress of American Schools in regard to Health Laws, from an English Engineer's Point of View"—this being the result of a seven weeks' tour made by the author for the purpose of examining the schools of the eastern and central states of America so as to see what progress had been made since the author's previous visit fourteen years ago. The progress was most marked. In 1891 the author found that the majority of the schools in the eastern states were warmed by hot-air furnaces fixed in the basement on what was known as the "Smead System." This system has now been almost entirely superseded by steam and hot water heating combined with fan ventilation, though great credit is due to Mr. Smead for the educational and pioneer work done by him: his system, however, was never considered suitable for the English climate, as the air was passed over the outside of a furnace which warmed it to the required temperature, and English engineers considered such air too dry and too liable to have the nature burned out of it. America has evidently come to the same conclusion.

The State of Massachusetts was the first to draft rules and regulations for the building of schools, and even in 1891 there were most stringent regulations for the heating, ventilation and sanitation of such buildings. These regulations stipulated that all rooms and corridors were to be heated to 70 degs. Fahr. in any weather, and that the supply of air was to be at least 30 cub. ft. per minute per scholar.

With regard to the temperature to be maintained, Mr. Sutcliffe observed that this was very stringent, and in the opinion of most English engineers far too high. "It must not be forgotten, however, that the percentage of humidity in the air is small compared with this country, and most people find that 70 degs. is not more comfortable in America than 60 degs. in England."

A Typical Modern Example.

The following description of one of the most recent schools in Chicago shows the amount of care taken to provide fresh air and comfortable working conditions for the children. The school selected is a three-storey building, 174ft. by 124ft. on plan, with twenty-seven rooms in addition to those in the basement. The three floors are practically identical; there is a longitudinal central corridor with the rooms on either side and a stairway at each end. The classrooms, eight per floor, are practically all of the same size, 27ft. by 32ft., and each has a spacious wardrobe through which the heating and ventilating flues rise. Air is distributed throughout the building on the plenum system. It is received by a double outlet fan in the centre of the basement, and discharged in opposite directions through both tempering and heating coils placed immediately beyond. The individual room supplies are carried from the warm-air plenum chamber to the various groups of flues. The fan is run at a speed of 150 revolutions per minute (belt-driven from a 9in. by 14in. steam engine) and has a capacity under an assumed air-pressure of $\frac{3}{4}$ oz. of about 25,000 cub. ft. from each outlet per minute. Every outlet, however, has a plate to enable any desired quantity of the delivery, up to 50 per cent., to be cut off. The air is carried from the plenum chamber through the small blast ducts to vertical flues, and thence to the room inlets, each room supply being independent. The air is delivered

about 6ft. above the floor level, but the area of the opening is such that a considerable reduction of the velocity of the incoming air is effected. Among the requirements of the apparatus it is specified that the supply shall amount to 1,800 cub. ft. of air per hour per scholar, assuming an average occupancy of fifty-four scholars per room. The escape of air from the rooms is in general through side registers at the floor line in the wardrobes, this method providing for warming these rooms as well. The exhaust system is designed to provide for the discharge of about 75 per cent. of the inflow from the fan into the building, the rest of the air escaping through the numerous inevitable points of egress possessed by every building besides the open doors. There are two boilers of the horizontal tubular type, 5ft. in diameter and 18ft. long, containing forty-eight 4in. tubes, and a pressure of 45 lbs. is carried. The exact cost of this building could not be ascertained, but a similar new school which is just being completed is expected to cost £29,000, of which £2,400 is allowed for the warming and ventilating plant.

Comparison of Steam-heated and Furnace-heated Schools.

Mr. T. G. Waters, who is the appointed expert in heating, ventilation and sanitation to the Chicago Board of Guardians, gave Mr. Sutcliffe some figures relating to two eight-roomed schools, each accommodating 320 scholars, which were erected in 1894. One of these had steam-heating apparatus and was mechanically ventilated by fans, while the other was heated by warm air from furnaces and ventilated by natural means only. The warming and ventilating plant in the first school originally cost £1,000 and in the furnace-heated school £640. The total cost of the bituminous coal used in the steam plant (at 10s. per ton) amounted to £90 per year, whilst anthracite had to be burned in the furnace plant, costing 26s. per ton, and the average cost of fuel was £200 per year. The steam-heated building was also less costly to maintain, the repairs to the plant from 1894 to date amounting to only £17, whilst £90 had been spent in the same time on the furnace heaters.

A Criticism.

Although one must admire the thoroughness with which the whole subject of heating, ventilation and sanitation has been studied in America, Mr. Sutcliffe said he could not altogether agree with the methods most in favour. As an example, all the heating surface was placed at one point in the basement. "Now they frequently get temperatures of 40 degs. to 45 degs. Fahr. below freezing, and this means that the hot air has to be delivered into the rooms at a temperature of from 150 degs. Fahr. to 170 degs. Fahr. in order to maintain an average temperature of 70 degs. throughout. It cannot be considered good practice, and doubtless in time the methods will be modified to avoid such high initial temperatures."

New York Schools.

Turning next to New York, similar stringent rules are in force. The city has its own board of education, and this board has its own architect: it also appoints a chief engineer, who is a trained man and designs all the heating, ventilating, sanitary and fire-prevention appliances, and sees to their proper application.

Mr. Sutcliffe said he had visited the new High School of Commerce, and in his opinion there was certainly no school in England, excepting perhaps the Manchester School of Technology, that could compare with it. The steam supply is furnished by four boilers, 18ft. long and 4½ft. diameter, and the conveyance of coal to these boilers and the removal of ashes from them is by an overhead trolley track which saves a great amount of floor space. It was specified that the whole building was to be kept at a

temperature of 70 degs. Fahr. in any weather, and the fans are large enough to supply fresh air at the rate of 1,800 cub. ft. per hour for every scholar in the building. This air is only delivered at a temperature of 68 degs., the real warming being done by steam-heated radiators fixed in each room. The radiators are all controlled automatically, so that if the temperature in any part gets above 70 degs. the nearest radiators are partially closed off, while if it sinks below 70 degs. the steam supply is increased. "This is much sounder in principle and design than the Chicago method of concentrating all the heating surface at one point, as the air is forced into the rooms at a normal temperature."

Boston Schools.

In Boston Mr. Sutcliffe had a long and interesting talk with Professor Woodbridge, who is recognized as an authority on the warming and ventilating of American school buildings. He recently designed a very effective plant for the Senate House at Washington, and is a great advocate of the plenum system of combined warming and ventilation. Speaking of the difficulties of keeping the ducts clean and free from dust, Professor Woodbridge said that he had made numerous tests of this dust and had always found it perfectly harmless. His theory was that with the large volumes of air passed through the ducts the oxygen so thoroughly purified the dust and dirt that no harm could possibly come from it.

Mr. Sutcliffe spent a day in examining the new Harvard Medical Schools at Boston, which are fast approaching completion. There are five huge schools in separate blocks and a large power-house occupying another block. Each block is three storeys high, and some idea of the equipment may be gathered from the fact that ten fans, each 15ft. in diameter, are used for supplying fresh air to the various rooms, and thirty-two fans of 7ft. diameter for exhausting the foul air. The heating of the building is on what is known as the "forced hot-water system," that is to say, water is heated by exhaust or live steam, and then forced through the pipes and radiators, completing the circuit back again to the heaters. The circulation in the pipe is so rapid that in sending the water round a circuit of 2½ miles it only drops about 7 degs. Fahr. in temperature. Some idea of the enormous size of these schools may be gathered from the fact that 104,000 sq. ft. of heating surface is used for warming the buildings, about half of the surface being placed close to the fans and the other half distributed in the form of radiators in the different rooms and corridors. The filtering of the air has received considerable attention, and each fan has its own air-supply and its own filter. The filter for each fan consists of 260 bags or sacks 6ft. long and 10ins. diameter. Fresh air enters at the front of the bag, and must, of course, pass through the fine canvas before it can reach the fan. The bags are easily taken down and cleaned or washed and others put in place whilst this is being done.

New Legislation.

The State of New York (as distinguished from the City of New York) last year passed an Act to "Amend the Consolidated School Law relative to the proper Sanitation, Ventilation and Protection from Fire of School Houses." This Act is very drastic in some of its provisions, and insists on all plans deposited with the Board of Education showing in detail the proposed heating, ventilating, lighting and sanitation. The Act goes on to say: "The Commissioner shall not approve any plans that do not provide at least 15 sq. ft. of floor space and 200 cub. ft. of air space for each pupil. Provision must also be made for assuring at least 30 cub. ft. of pure air every minute per pupil, and the facilities for exhausting

the foul air shall be positive and independent of atmospheric changes." This, of course, means that no school can be built without providing mechanical ventilation of some description.

The State of Pennsylvania has also so recently as April 22nd last passed "An Act for the purpose of governing the construction of public school buildings in order that the health, sight and comfort of all pupils may be protected." The Act declares that "each classroom shall have at least 15ft. of floor space and not less than 200 cub. ft. of air space per pupil, and shall provide for an approved system of heating and ventilation by means of which each classroom shall be provided with fresh air at the rate of 30 cub. ft. per minute for each pupil, and warmed to maintain an average of 70 degs. Fahr. in the coldest weather."

These new Acts, said Mr. Sutcliffe, showed that the school authorities in America were keenly alive to the necessity of healthy school buildings, and one could not help asking when our own education authorities were going to wake up to the vital necessity of fixing some definite health standard for all schools.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Government Surveying Appointment.

HERTFORD.—FELDMESSER writes: "How can I obtain a situation as surveyor and map maker, Government or otherwise? I have a knowledge of field surveying, but wish to join a surveying party or expedition, if necessary as chairman."

For appointments in the Ordnance Survey Department application should be made to the Director-General, Ordnance Survey Department, Southampton. Examinations are held occasionally for the post of draughtsman in the Hydrographical Department of the Admiralty, particulars of which can be obtained from the Secretary, Civil Service Commission, Burlington Gardens, W.

HENRY ADAMS.

Right to Passage-way.

EALING.—WORKS writes: "I own a house on a ninety-nine years' lease, and my first floor, including the kitchen flue, is carried over a 3ft. passage which runs from the footpath down the side of the ground floor and forms a side entrance for myself and neighbour, and a back entrance for two next that. I have had a slight dispute with regard to the use made of this, and am anxious to know whether I should be within my rights in concluding this to be my property, and also in erecting a gate at the street end of same. Sketch sent (not reproduced)."

The question of the ownership of the land does not affect this case. (a) If your neighbours have used the passage-way in dispute for twenty years past they have acquired a right to do so for ever (under the "Prescription Act"). Assuming, however, that this has not been done:—(b) As the property is leasehold, I have little doubt that the roads and passage-ways were properly set out by the freeholder when the land was first built upon, and probably you will find the plan upon your lease answers all your questions; if it does not clearly

show these, why do you not apply to your head landlord for information? As the other houses appear to have no other back entrance, I much doubt whether you can stop the passage-way at all. F. S. I.

Width of Lane: Power of Council to Refuse Plans.

YORK.—F. & H. write: "We send copy of a plan (not reproduced) submitted to a rural district council for approval. The council are in possession of urban powers. They have, however, declined to pass the plan because 'North Lane,' which is the only means of access to the proposed estate, is in their opinion too narrow. Have they the power to do this, seeing that the owner of the proposed building estate does not own any other land abutting on North Lane?"

There is no doubt that the council are justified in refusing to sanction a street such as you show upon your drawings; no street can be set out of a less width than 36ft.; it must be of that width from end to end and must have at least one entrance of the full width. Apparently the first two houses you propose to erect (hatched on plan) would have a 36ft. roadway in front were the old wall and building demolished, and I think the council should sanction the erection of this pair. Beyond that they cannot go. The fact that your client would be obliged to sacrifice a large proportion of his small estate for roadmaking has nothing to do with the case; it is "his misfortune, not his fault." F. S. I.

Evening Classes in Trigonometrical Surveying.

ENFIELD.—INSTITUTE writes: "Which is the best evening school in London for the study of trigonometrical surveying?"

It would be invidious to make any distinction, but we would suggest as a very good course the City of London College (City Polytechnic), White Street, Moorfields, E.C.

Parquetry on Canvas.

PETERSFIELD.—H. T. K. writes: "Where can parquetry on canvas be obtained?"

From Messrs. The Westminster Patent Flooring Co., of King's Road, Chelsea, London, S.W., or Messrs. Damman & Co., of 34, Osnaburgh Street, London, N.W.

A Parochial Hall.

LIVERPOOL.—F. A. H. writes: "(1) What should be the superficial area of a parochial hall to seat 300, including the necessary gangways and platform at end? (2) Would 16ft. be high enough for the hall? (3) Which is the best way to ventilate the hall, which has a club-room over? Would you trust to fanlights over windows, or carry up a couple of vertical shafts through the club-room and so to the roof? If so, what area should each shaft be? (4) I believe that in one of your back numbers you gave plan and elevations of a parochial hall. What was the date of the issue?"

(1) The space allotted to each person should be not less than 2ft. 4ins. by 1ft. 8ins.; the gangways should be not less than 3ft. wide, and run down each side of the building and at the back. The platform is optional.

(2) Yes, if the roof is an open one, otherwise we should think 20ft. ought to be the minimum. (3) We should build air flues containing inlets and outlets in the form of piers on the outside walls and carry ducts from them to main outlets on the ridge. We should also advise fanlights. Each person requires about 1,800 cub. ft. of fresh air per hour, and on the "natural" system there will be draughts if the air is moved faster than about a change of four times per hour. As regards the size and position of air-ducts, you had better consult

firms who have had experience of this work, as small details affect the matter so much. The mechanical system is more certain and satisfactory, but more expensive. (4) We have published nothing suitable.

Tower of St. Alfege Church, Greenwich.

LONDON.—STUDENT writes: "Is there a book relating to, or are there any drawings of, the tower of St. Alfege Church, Greenwich? I have made a search, but without success."

There seems to be no publication whatever which gives any information relating to the tower of this church. H. Y. M.

Ventilation of Small Living-rooms.

OXFORD.—FRESH-AIR FIEND writes: "I send a rough plan (not reproduced) of two small living-rooms attached to some stable buildings. The dimensions of each are about 12ft. by 12ft. by 8'5ft. The external walls are hollow. There are no special arrangements for ventilating the rooms, and in the evenings, when the door is closed (and the windows also, usually), the atmosphere gets hot and stuffy, especially in the winter-time. How can I improve the ventilation?"

We suggest the provision of an inlet of the hopper type, such as Messrs. E. H. Shorland & Brother supply, with an outlet with mica flap in the outside wall of each room, arranged in such a position as not to cause a draught across the room to the chimney opening or the outlet ventilator, i.e., in the corners nearest the fireplace and range.

Safe Load on Steel Stanchion.

BRADFORD.—CORPORATION writes: "Please work out by Gordon's formula $p = \frac{fs}{1 + a \frac{l^2}{h^2}}$

the safe load on a steel stanchion 18ft. high, ends fixed (section sent); also give a simple method of approximately determining the result; also give constants for cast-iron, wrought-iron and steel for formula on beams, B.W. = $\frac{cad}{L}$."

The stanchion given is Dorman, Long & Co.'s 12in. by 6in. by 54 lb. rolled steel joist marked *G7, the area of which is stated in their catalogue as 15'9 sq. ins., and the least moment of inertia (direction of bending) as 31'43 in. inch-units. The approximate strength as a stanchion 18ft. high, with the ends fixed, will be given by the writer's "straight line formula" ("Designing Iron-work," 2nd series, Part 2, p. 8), 5'5 - '075 $\frac{l}{d}$, l and d being in the same units,

$$= 5'5 - \frac{0'075 \times 18 \times 12}{6} = 2'8 \text{ tons per sq. in.}$$

safe load. Area = 15'9 sq. ins.; therefore total safe load = 15'9 × 2'8 = say 45 tons. By Gordon's formula

$$w = \frac{fs}{1 + a \left(\frac{l}{d}\right)^2} = \frac{7 \times 15'9}{1 + \frac{1}{900} \left(\frac{18 \times 12}{6}\right)^2} = \frac{111'3}{1 + 1'44}$$

= say 46 tons safe load. The latest, and so far the best, formula is due to Prof. Claxton Fidler and will be found explained in the work cited above. Applied to the present case, it makes the safe load only 32'6 tons, which, if wrong, errs on the side of safety. In reply to the second question, the constants for the formula $\frac{cad}{L}$ for central breaking weight on

flanged beams are cast-iron 2, wrought-iron 6, steel 9; but the formula is used by architects, not by engineers. The latter design iron-work by allowing a safe working stress on the material, and do not go round and round the subject by finding breaking load in centre, converting it to equivalent distributed load and then applying a factor of safety to get at what they want. See "The Practical Designing of Structural Iron-work" (Spon, 8s. 6d.). HENRY ADAMS.

UNIVERSITY COLLEGE, LONDON.—Professor E. A. Gardner on "Architectural Sculptures."

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. Goodyear on "Architectural Refinements," at 8.30 p.m.

Thursday, November 2.

CARPENTERS' COMPANY.—Dr. A. Wynter-Blyth on "The Sanitary Arrangements of Buildings, &c.—II.," Carpenters' Hall, London Wall, at 7.30 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. Goodyear on "Architectural Refinements," at 8.30 p.m.

ARCHITECTURAL ASSOCIATION.—Conversazione.

Friday, November 3.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. R. Park on "Underpinning," at 8 p.m.

New Companies.

KNIGHTSBRIDGE PROPERTIES, LTD., builders, decorators, &c. Capital: £50,000.

CWMUDU QUARRIES, LTD., to adopt an agreement with W. H. Woodliffe, A. J. Colson and A. L. White, and to carry on the business of quarry proprietors, builders, contractors, &c., Ynysdu. Capital: £75,500.

STRANGE AND SONS, LTD., to acquire the business carried on at Tunbridge Wells and Tonbridge, Kent, and elsewhere, as Strange and Sons, to adopt an agreement with C. M. Strange, E. J. Strange and C. M. Strange, and to carry on the business of builders, &c. Capital: £25,000.

FRAZZI FIREPROOF CONSTRUCTION, LTD., to acquire the business carried on by A. E. Brown and E. J. Brown at Essex Wharf, Durdur Street, Whitechapel, E., as importers of and dealers in Frazzi fireproof materials, builders and constructional engineers, constructors of fireproof floors, partitions, roofs, &c. Capital: £12,000.

OXFORD PORTLAND CEMENT CO., LTD., to acquire a lease of the Washford Pits, and the rights over adjoining limestone and clay-bearing lands at Kirtlington, near Oxford, to erect works, to adopt an agreement between A. Dillon and A. J. McMillan, and to carry on the business of manufacturers of cement, plaster, &c. Capital: £50,000.

GLASGOW TECHNICAL COLLEGE.

AT the nineteenth annual meeting of the governors of the Glasgow and West of Scotland Technical College held on Thursday last the report for the past year was presented. This stated that the college had more than maintained its satisfactory position both in regard to the number of students (at present 5,671) and the standard of instruction given. Efforts have been made during the year to complete the first section of the new building in time for the coming session. This building is the largest devoted to education in Britain, and the progress made since the laying of the memorial stone by the King, less than two and a half years ago, is very satisfactory. The total expenditure to date has been £163,000.

An important addition has been made to the staff of the college by the appointment of Mr. G. Moncur, B.Sc., A.M.I.C.E., as lecturer in civil engineering. The college is now among the few in this country with a fully organized department devoted solely to this branch of engineering.

The principal change on the staff during the year has been caused by the election of Prof. W. H. Watkinson, M.I.C.E., to the Harrison chair of engineering in the University of Liverpool. His place at the Glasgow College has been taken by Dr. A. L. Mellanby, lecturer at the Manchester Municipal School of Technology.

The organization of the Glasgow School of Architecture under the joint committee of this college and the Glasgow School of Art was completed during the past session, and the course of study for the joint diploma and joint certificate was adjusted. Professor Bourdon has been appointed to the position of Director of Architectural Studies, with the special duty of securing the co-ordination of the work of the two institutions in relation to the curriculum of architecture. The department of architecture, under Professor Gourlay, has been reorganized to meet the requirements of the new curriculum, and additional classes have been arranged, including new courses on masonry, brickwork and quantity surveying, and special lectures on stereotomy.

The proposals for the coming session include new lectures and drawing classes in civil engineering and surveying, a course on trees and timber intended mainly for teachers of woodwork; and drawing classes and a preliminary class in plumbing.

The Architectural Craftsmen's Society now has a membership of 117.

Number 13.
October, 1905.

LEGISLATION.

THE laws, by-laws, rules and regulations governing the erection of buildings are being multiplied from year to year, and amongst the official requirements which have been more recently extended those relating to fire-prevention must necessarily be given greater attention than heretofore, having regard to the importance being attached to them by the various local authorities. Both architects and builders have been somewhat prone to give requirements as to fire-prevention second place, and as a matter of fact many requirements are entirely overlooked until they are officially reminded of them by the authorities. Apart from the official requirements, various rules are nowadays also enforced by the insurance corporations which demand every possible attention, for only by proper observance are obtainable rebates on the insurance rates and classification for moderate rating dues. Having regard to the importance of this question, we are in this supplement devoting special attention to rules and regulations.

The article on the subject by Mr. James Sheppard, the leading authority in this country on legislative enactments of this description, is an important one and we print the full text of the Standard Fire Rules as issued by the tariff offices, as also the schedule of fire-resisting materials as amended during the last session of Parliament, which regulations in their amended form are, however, not yet generally known.

EXISTING BUILDING REGULATIONS FOR PROTECTION FROM FIRE, WITH SUGGESTIONS.

By JAMES SHEPPARD, A.Inst.E.E.,
Insurance Surveyor.

Introduction.

Waste of life and property from fire has been and continues to be a scourge of communities in all parts of the habitable globe. As a result of such experience fire, although a good servant," is universally acknowledged to be "a bad master." Regulations relating to fire-protection are made with the object of lessening these evils and retaining fire within the limits of useful service.

The requirements of manufactures and commerce, with other necessities of civilization, leads to the accumulation of population and buildings in favoured localities. The full employment of these, unless under suitable control, involves great and increasing liability to fires, with attendant danger to life, and also the probability of sweeping conflagrations.

It is an important part of the duties of national and municipal governments to adopt, amend and enforce efficient laws and regulations for the avoidance as far as possible of evils above referred to.

The application of suitable regulations for securing sanitary dwellings, workshops and factories has done much to improve the health and lower the death-rate of the

nation, but regulations hitherto adopted in the United Kingdom with the object of lessening the loss of life and waste of property by fire have been far less successful. This unsatisfactory result may be explained by unwise concessions to the demands of combinations of land and building owners, manufacturers, traders and others when framing regulations for protection from fire, together with the absence of liability on occupiers of premises where fires originate for suitable fines or the costs of enquiries, as in the case of boiler explosions under the Acts of 1882 and 1890, or for damage that may result from such fires to the property of adjoining owners.

Insurance against fire is a necessity in modern conditions of life and trade, but the facilities it offers to individuals to guard against personal loss may tend to lessen carefulness and so increase the number of fires. Fire insurance is based on the beneficent principle of mutual help, simply distributing losses by fire over the whole body of insurers, but such losses are none the less absolute national waste. The destruction of an industrial establishment which may be the chief support of a small town causes serious distress among the employees and others, some of whom may find it necessary to obtain relief from public funds, thus adding to the burden of the district towards which the establishment destroyed ceases for a time to contribute. It is, therefore, to the public interest, both nationally and municipally, to lessen waste by fire in every possible way, and this altogether apart from any question of fire insurance, the cost of which must be ultimately controlled by the average amount of loss on the various classes of property insured, and would, therefore, be reduced by suitable action on the part of public authorities.

The restraining influence exerted by the increased cost of fire insurance to the public, resulting from numerous fires and conflagrations, is, unfortunately, under present practice not operative until too late—that is, after the evils resulting from excessive fire waste have fully developed.

This was the experience of Liverpool previous to 1843, leading, in addition to the Liverpool Improvement and Building Act of 1842, to the passing of the Liverpool Fire-prevention Acts, 1843 and 1844. Important clauses in these Acts are retrospective, and they contain provisions for meeting the cost of making required alteration and improvement in warehouses existing when the Act came into operation. Other cities and towns, although having similar experiences, have not hitherto followed Liverpool's example in securing special Fire-prevention Acts.

Property owners instinctively consider how they can secure the largest return for capital invested in land and structures; this, especially in the case of commercial centres, results in the erection of buildings to obtain on a given site the maximum amount of floor area and light at a minimum cost. Public evils resulting from personal financial con-

siderations of this nature are liable to be still further increased in cases where the land is the property of one capitalist and the building the property of another, the whole reverting to the landowner after a term of years. The crowding together and the use of buildings erected on this principle involves most serious danger not only of ordinary fires but also of disastrous conflagrations. The liberty of the subject in this respect needs to be controlled by suitable laws for the safeguarding of the public interest.

Protection from Fire.

The term "protection from fire" may be taken to include provisions under each of the following heads:—

(1) Laws and regulations with regard to structures and to appliances for their artificial warming and lighting adopted with a view to prevent fires occurring and to retard their extension if they should occur.

(2) Regulations for the transit, storage and use of specially inflammable or dangerous substances and the mode of warehousing merchandize and general goods.

(3) Provision of suitable water-supply, with appliances and organizations for the early discovery and extinction of fire and the saving of life and property from fire.

(4) The preparation of annual returns clearly showing for future guidance the work of such organizations, with the nature and extent of successes and failures, the causes of failures and of fires in different districts under their care.

(5) The discovery and punishment of persons causing fires wilfully or by gross negligence.

The subject, therefore, covers a very wide field. Prevention being admitted on all hands to be better than cure, it may be well to restrict the following remarks chiefly to the first part of the subject, namely, fire-prevention and provisions for retarding its extension.

The by-laws in use throughout the United Kingdom for the prevention of fires in buildings are for the most part made under powers conferred by—

The Towns Improvement Clauses Act, 1847, s. 109.
The Public Health Act, 1875, s. 157.
The Public Health (Ireland) Act, 1878, s. 43.
The Public Health (Scotland) Acts, 1867 and 1879.
The Public Health Amendment Act, 1890, s. 23.
The Factory and Workshops Act, 1901, ss. 14, 15, 16 and 153

Numerous Building and Improvement Acts containing clauses relating to fire-prevention have been obtained by different corporations and local authorities, the more important of these being:—

Liverpool Building, Fire-Prevention and other Acts, 1842 to 1893.
Manchester Improvement and Corporation Acts, 1844 to 1891.
Dublin Improvement and Corporation Acts, 1851 to 1890.
London Building Acts, 1804 to 1905.
Glasgow Building Regulation Act, 1900.

Many of the regulations adopted under powers conferred by the foregoing Acts are contained in the Model By-laws issued by the Local Government Board in 1877, reprinted in 1901; these by-laws are used in the following remarks for comparison.

The object of the regulations as regards fire is usually stated to be "for securing stability and the prevention of fires." The London Building Act states its object with reference to fires to be "the sound construction of building"—"the diminution of the dangers arising from fire."

1. Provision in building laws, by-laws and regulations for the prevention of fire applicable to the United Kingdom may be considered in the following order:—

Definitions.—(a) When existing buildings are to be subject to regulations applicable to all new buildings.

(b) Definition of different classes of buildings in accordance with their use or intended use and of the material and work approved for their construction.

Fire Prevention.—(c) Rules adopted to prevent the occurrence of fire.

(d) Rules adopted with the view of retarding the spread of fire throughout the building in which it may originate and for preventing its spread to surrounding buildings.

(e) Administration of the foregoing laws and by-laws.

Definitions as to existing Buildings.

(a) The definition of what is to constitute a new building is of considerable importance, as upon this largely depends the ultimate application of existing regulations to old buildings, but such definitions vary widely in the by-laws applicable to different districts.

By-laws made under the authority of the Public Health Act, 1875, are subject to section 159, which reads: "For the purpose of this Act the re-erecting of any building pulled down to or below the ground floor or of any frame building of which only the framework is left down to the ground floor, or the conversion into a dwelling-house of any building not originally constructed for human habitation, or the conversion into more than one dwelling-house of a building originally constructed as one dwelling-house only, shall be considered the erection of a new building."

By-laws adopted under powers conferred by most of the local Acts obtained by different cities and towns, or made under the Public Health (Ireland) Act, 1878, s. 43, usually provide that "whenever any building has been taken down to an extent exceeding one-half of such building measured in cubic feet, the rebuilding shall be considered the erection of a new building." This agrees with corresponding provisions in the London Building Act, 1894, s. 5 (6), and the Glasgow Building Regulation Act, 1900, s. 4, but other important cities adopt the definitions in the Public Health Act, 1875, above recited.

The Metropolitan Act, 1855, s. 10, now repealed, in addition to the clause last named, provided that "every portion of such old building that is not in conformity with the regulations of this Act shall be forthwith taken down." This provision may be implied in the present rule, but a definite statement on this point is desirable.

The expression "new building" should certainly have the same meaning and application in all by-laws and regulations.

Classification of Buildings.

(b) A classification of buildings is necessary for the purpose of applying the rules applicable to each class. It is therefore important to give clear and correct definitions, so that all buildings may be subject to suitable regulations. The following divisions are usually adopted, but the definition of each class is not the same in different districts:—(1) Public buildings; (2) buildings of the warehouse class; (3) domestic buildings; (4) dwelling-houses.

The definitions of a public building vary chiefly with regard to the exclusion or inclusion of hotels, restaurants, common lodging-houses, homes, refuges or shelters when such buildings extend to more than 250,000

cub. ft. (in some by-laws 100,000 cub. ft.) or have sleeping accommodation for more than 100 persons. It is certainly desirable to place hotels of even smaller extent than 250,000 cub. ft. under the rules applicable to public buildings, in whatever district they may be built. In some cities, including Glasgow, all hotels and restaurants, not being merely shops so used, are classed under public buildings.

The definition of buildings of the "warehouse class" varies considerably in different regulations. Under the Model By-laws of the Local Government Board this class is stated to mean "a warehouse, factory, manufactory, brewery or distillery"; to this the London Building Act adds "and any other building exceeding in extent 150,000 cub. ft. which is neither a public building nor a domestic building." In the Bill prepared with a view to the 1894 Act the words "dwelling-house" are used, but unfortunately so far as fire-protection is concerned these have been replaced in the Act by the words "domestic building," thus allowing the erection of buildings for occupation as warehouses, stores, shops and workrooms in crowded districts in such a way that they fail to retard the spread of fire to surrounding buildings of a similar construction and occupation. In the Metropolitan Building Act, 1855, regulations now only applicable to warehouse buildings as defined in the present Act were applicable to a "warehouse or other building used either wholly or in part for the purposes of trade or manufacture"; in this and some other respects the London Building Act of 1894 is retrogressive. Under the Liverpool Improvement Act, 1882, where buildings combine characteristics of more than one class, the corporation may decide to which class such building or any part shall be deemed to belong.

In the Glasgow Building Regulation Act, 1900, a building of the "warehouse class" means a warehouse, factory, manufactory, brewery or distillery or similar building, and includes (1) a building exceeding in cubical extent 150,000 cub. ft., used or constructed to be used wholly or principally as offices or counting houses; and (2) any other building (not a public building) exceeding in extent 150,000 cub. ft. which is not an hotel, lodging-house, home, refuge or shelter, and does not consist wholly or principally of dwelling-houses. The last definition embraces most commercial and trade buildings, and properly places them under regulations applicable to buildings of the warehouse class. It is desirable that a similar definition should be adopted for London and all commercial cities, omitting the words "or principally" in clause 2 and reducing capacity limit to 100,000 ft.

Most by-laws are in agreement with regard to the definition of a "domestic building," which in the London Building Act, 1894, includes a dwelling-house and any other building not being a public building or of the warehouse class. The term "dwelling-house" hardly admits of any other definition than that of a building used wholly or principally for human habitation.

The foregoing statements with regard to definition indicate the importance of a clear description of the buildings to be included in the "warehouse class." All buildings throughout the United Kingdom having a capacity exceeding 100,000 cub. ft., and situated adjoining or within 30 ft. of any other building, and not being entirely dwelling-houses, nor buildings subject to regulations applicable to public buildings, should be subject to requirements applicable to buildings of the "warehouse class." Where such buildings are situated in congested areas, which occur in all progressive and in some old cities, further special regulations should be applied.

The London Building Act, 1894, and recent

by-laws of some other cities, give definitions for "fire-resisting materials," but the list of such materials contained in the second schedule of the London Act which is followed in other cases confuses the term "fire-resisting" with "incombustible." Experience conclusively proves that incombustible materials are not necessarily "fire-resisting." Granite and stone, for instance, allowed in item 2 of the schedule, disintegrate under the action of heat and the rapid changes of temperature which occur during a fire; such materials are most unsuitable for use as corbels, and if used for detached columns or piers would be specially dangerous. The unreliable nature of stone under the action of fire is recognised in item 6 of same schedule, which provides that flag stones, when used for floors over arches, must not be exposed on the underside and not supported at the ends only, if they are to be accepted as "fire-resisting."

Iron and steel, allowed in item 3 of the schedule, to be used for beams and columns, expand considerably when heated, before material loss of strength occurs, and thrust out walls on which they may have a bearing, and then on cooling rapidly contract and further displace the walls. It is very doubtful if the displacement of walls in this way, and consequent spread of fire, can be prevented (when iron and steel beams are heavily loaded) by the provision of a space at the end of metal beams, as required by s. 5 (2) of the London Building Act. The L.C.C. have powers to make by-laws for the protection of ironwork used in the construction of buildings from the action of fire, under s. 164 of the London Building Act, 1894, but have not apparently issued such regulations.

Iron or steel where used in buildings constructionally cannot be considered "fire-resisting" unless thoroughly protected against the absorption of heat in a suitable manner by incombustible non-conducting material. The necessity of protecting metal is recognized in item 4 of the schedule of the London Building Act, which requires, where hard wood is used in combination with iron for beams or posts, the timber and iron (if any) to be protected by plastering in cement or other incombustible non-conducting external coating, before such beam or post can be accepted as fire-resisting. The need of this is also acknowledged in the regulations made by the L.C.C. with regard to theatres, section 18 of which requires all constructional ironwork to be embedded in fire-resisting material. The Glasgow Building Regulation Act, s. 17, requires iron beams or columns supporting any main wall within a building to be suitably protected against fire by plaster or cement or other fireproofing material $\frac{1}{2}$ in thick.

Slate, also allowed as being "fire-resisting," is one of the most treacherous materials used in buildings. When under the action of fire, and if used for corbels as suggested in item 5 of the schedule of the London Building Act, would be most dangerous. Slate as a roof-covering, although light, is cold in winter and hot in summer, desiccating all woodwork immediately under it, which in the event of fire in an adjoining building may be ignited even through the slates, and in any case the slates quickly break up, leaving woodwork exposed to flames.

Large timber structures covered with thin slates not allowed on the ground level are sanctioned on the top of buildings where in crowded districts they are infinitely more dangerous. In such positions the provision of flat solid roofs should be insisted upon.

The use of stone and pit or Thames ballast containing large pebbles for concrete causes the concrete to split under the action of continued heat. Broken bricks, clinkers or hard-burnt clay ballast should be used for fire-resisting concrete.

The use of stone for templates, corbels,

lintels and jambs as suggested in most building by-laws should be avoided as far as possible, brick and cast-iron duly protected being equally cheap and far safer under the action of fire for such purposes.

Regulations controlling construction with the object of preventing the occurrence of fire.

(c) The cause of nearly all "serious" fires is undiscovered, but experience leads to the definite conclusion that a large majority of these fires result from structural defects, and such fires usually originate in connection with flues, fireplaces, stoves or furnaces, to which building regulations give considerable attention, but all allow the construction of flues (at a greater angle than 45 degs. with the horizon) from ordinary open fireplaces with 4½ ins. only of common brickwork between the inside and outside of the flue. This in the case of flues subject to the wear and tear of constant use with coal fires and the impossibility of proper internal repair, cannot be expected to give reasonable security during a long term of years. Flues of this nature utilized for modern stoves are responsible for the destruction of numerous county mansions and for frequent fires in towns. The upper part only of a flue taking a course at an angle of less than 45 degs. with the horizon is required to be gins. thick.

By-laws usually require that flues from any oven, furnace, steam boiler or close fire, used for any purpose of trade or business, or from a cooking apparatus in any hotel or restaurant, be surrounded with brickwork gins. thick for a distance of 10 ft. or to the ceiling of the room next above the floor on which the oven, &c., may stand.

The hottest part of a flue is not always in that portion within 10 ft. of the fire, but is often 50 ft. or more distant, where bends exist, causing the accumulation of heat. If it is necessary to require gins. of brickwork round the portion of a flue that may be within 10 ft. or 20 ft. of the fire, it is equally necessary, if reasonable security is desired, that the thickness of gins. should be continued for the whole length of the flue, and not stop at a weak point where floor timbers and wood skirting are allowed close to 4½ in. brickwork and plaster surrounding the flue.

It is usual to require the inside of flues to be pargeted or rendered, but the Manchester by-laws also allow the brickwork on the inside of flues to be pointed only. This forms a preferable finish, especially if the face of the work is brushed over with thin cement grout. When pargeting is used coring openings must be left, and even then in a high building it is often necessary to cut numerous other openings into a flue to remove fallen pargeting; the building-up of all these openings necessarily leaves the flue at these points more or less defective. Some by-laws require the outside of all flues within the building, where the enclosing brickwork is less than gins. thick, to be plastered, but many only require this plastering at points where woodwork or timber is nearer than 2 ins. to the face of such brickwork. In the London Building Act and other by-laws both provisions are included, but this tends to weaken the force of the first provision, which if duly carried out—which often, unfortunately, it is not—necessarily meets the second requirement.

The Dublin by-laws require the inside of every flue to be lined with fireproof piping of stoneware at least 1 in. thick, and the spandrel angles filled in solid with brickwork or other incombustible material.

If enclosures to flues only 4½ ins. thick are allowed, the use of bricks of a special material and form to provide greater security should be required.

Far more stringent rules with regard to the construction of flues are enforced in Continental and American cities than any adopted in the United Kingdom.

(To be continued.)

**INSURANCE COMPANIES' REGULATIONS
As to Building Construction.**

SOME reference has been made from time to time regarding the rules of the insurance companies as represented by the Fire Offices' Committee, but our attention has been called to the fact that quite a number of architects and builders do not appear to be aware of the existence of the General Standard Fire Office Rules on matters of building construction.

This is probably due to the policy of the Fire Offices' Committee heretofore observed of not publicly issuing their regulations but practically only sending them out on demand. It is only latterly that the Fire Offices' Committee has come out of its shell to any extent and circularized its rules, this measure perhaps being due to the fact that one tariff company, some time back, published the rules for the use of its own agents as a kind of bait to show the advantages obtainable if business were done through their agency.

Why greater publicity should not have been accorded earlier to the rules in question we know not, except if it be the somewhat short-sighted policy on the part of some of the senior companies, who imagine that anything savouring of a policy of fire-prevention might harm their businesses and annual premium turnovers, not realizing that fire-prevention in its best sense and practised in moderation is the true friend of the insurance companies and leads to larger turnovers at less risk and at rates that are easily manageable and encourage full insurance. There is, of course, already a change in the feeling in certain directions, and it is due to this change in feeling that the last few years have seen any kind of standard rules formulated which are a step in the right direction.

For reference purposes we publish the more important rules. Speaking generally, they are sound and moderate. They contain some features of faddism, it is true; and in certain directions the requirements are antiquated, as, for instance, in respect to armoured, i.e., tin-clad doors. But in two directions they are certainly thoroughly up-to-date, namely, regarding reinforced concrete and fire-resisting glazing, where the rules are mainly based on the experience gained by accurate research work. Observance of these rules will ensure a reduction of rate.

We only omit to publish those rules relating to sprinklers, which are somewhat of a too specialist character for dealing with under this heading. Apart from the rules here published, the insurance offices also have what might be termed a confidential guide to their surveyors which has not yet been made public property.

RULES OF THE FIRE OFFICES' COMMITTEE.

I.—Standard Fire-resisting Buildings (not including Cotton Mills, Flax Mills, Woollen Mills and Worsted Mills).

Buildings to be deemed of Standard Fire-resisting Construction must conform to the following description.

Height and Cubical Contents.

1. Height not to exceed 80 ft., measured from the lowest point of the land level or ground line of the site on which the building stands to the level of the highest part of the roof.

2. Cubical contents of any one compartment not to exceed 60,000 cub. ft.

N.B.—In computing the cubical contents of a compartment, the floor area, excluding doorway and window recesses, and the actual height from floor to ceiling, are to be measured. Due deduction may be made for a sloping roof.

Walls and Partitions.

3. Brick, terra-cotta and/or cement concrete composed of broken brick, burnt ballast, furnace slag, clinker or other similar hard and burnt material.

4. No external area or party-wall to be less than 13 ins. thick in any part, or if of concrete 2 ins.

N.B.—Stone used externally only as ashlar or facing, with a backing of brickwork not less than 13 ins. thick, and for dressings, sills, string-courses and cornices, allowed.

5. All internal partitions to be of incombustible material, excepting only office enclosures of hard non-resinous wood with or without glazing.

6. If there is any building adjoining, the dividing or party-wall to extend at least 3 ft. above the roof of the fire-resisting building.

Flues.

7. All flues to be built of brickwork, no part of which towards the interior of the building is to be less than gins. thick, and all furnace flues to be lined with firebrick throughout for a distance of at least 20 ft. from the furnace. No timber or woodwork to rest in or be plugged into the brickwork of any flue.

Openings in Walls.

8. The total superficial area of openings in each external or area wall of any storey above the ground storey not to exceed one-half of the area of the wall (measured as to height from floor to ceiling of the storey in which the openings occur). All loop-hole or teagle doors and frames and window frames and sashes to be of iron or other hard metal. All windows above the ground storey to be glazed with glass not less than ¼ in. thick, in sections not larger than 2 super. ft., or wired glass, or electro-copper glazing in accordance with the rules of the Fire Offices Committee in force when such glazing is provided.

9. Every window or other opening above the ground storey opposing (whether directly or diagonally) and within 2 ft. of any window, skylight or glazed or other opening in any other building (whether such latter window, skylight or opening be protected or not), or overlooking (whether directly or diagonally) and within 2 ft. of the roof of any building to be protected by "fireproof" shutters or "fireproof" doors.

Floors.

10. Brick arches, terra-cotta, fireclay, or concrete as above described, the floor being in no part less than 6 ins. in thickness, and carried on metal joists, girders and columns, or brick walls or piers.

N.B.—Floors of wood not less than gins. thick, ceiled with plaster on metal lathing and with the floor boards laid on the bearers without intervening space, allowed.

11. Wooden flooring laid on concrete allowed provided there is no space between the wood and the concrete. Wooden fillets not exceeding 2 ins. deep permitted if bedded flush in the concrete.

12. Scuppers to carry off water the opening of each of which shall not be less in area than 21 super. ins. to be provided in the external walls to each floor above the ground storey at intervals of not more than 12 ft.

N.B.—In buildings within the City of London or within the area controlled by the London County Council scuppers are not essential.

Roofs.

13. Roofs to be entirely of the incombustible materials as described for floors in Rule 10, except that 4 ins. be substituted for gins. in thickness.

NOTE.—Glass not less than ¼ in. thick in sections not exceeding 36 super. ins. set in iron or other hard metal, and wired glass or electro-copper glazing in accordance with the rules of the Fire Offices Committee in force when such glazing is provided, shall for the purpose of this rule be deemed incombustible.

Outlets on to roofs rendered necessary to satisfy the requirements of the Factories and Workshops Acts permitted, provided that all doors and frames be of iron or cased in iron plate at least ¼ in. thick, and that they be self-closing.

Protection of Structural Metal-work.

14. All columns or stanchions to be covered with brickwork or porous terra-cotta (at least 2 ins. thick), or with cement, concrete or plaster at least 1½ ins. thick, keyed into metal supports and protected by a metal guard up to a height of not less than 4 ft. from the floor where cement, concrete or plaster only used.

15. Girders, joists, lintels and all structural metal-work (other than columns and stanchions, but including framework of roofs), where not covered with brickwork, to be completely encased in porous terra-cotta at least 2 ins. thick, securely anchored, or cement concrete, or plaster at least 1 in. thick keyed into metal supports.

16. Space must be left at the ends of girders and joists to permit of expansion.

Linings and Ceilings.

17. No lining of wood or textile fabric to any part of the walls, partitions, ceilings or roof.

Floor Openings.

18. No openings through any floors allowed except as follows:—

(a) Holes to admit driving shafts, pipes and iron or earthenware tubes for electric conductors. Shafts to fit closely in metal collars, and all pipes and tubes to be cemented round the full thickness of the floor.

(b) Staircases and hoists of which the enclosures are constructed entirely of brick or cement-concrete as above described at least gins. thick, with a regulation fireproof door to every opening.

N.B.—Stairs and landings within said enclosures to be constructed of incombustible material.

N.B.—Where the building is within the City of London or in the area controlled by the London County Council hardwood doors to openings may be allowed instead of fireproof doors.

N.B.—Where the staircases and hoists extend to the top floors they must have a glass roof protected externally with strong wire-work, and the enclosing walls must be carried through and 18 ins. above the roof of the building.

In factories and workshops in the area controlled by the London County Council a glass roof protected as above is only to be provided in cases where the enclosing walls and staircases are carried through and 18 ins. above the roof of the building, and also above the roof of the adjoining premises. Otherwise the roof must comply with the requirements of the London County Council.

(c) Belting and rope races enclosed as for staircases and hoists.

Shafting through Walls.

19. Shafting where passing through walls to fit closely into wall, or have wall boxes closed with iron plates not less than ¼ in. thick, leaving no open space.

Pipes and Electric Conductors.

20. All pipes in the building, except water pipes not exceeding 1½ ins. in diameter, to be of hard metal. No wooden casing to be used for enclosing electric conductors.

Communicating Compartments.

21. Two or more compartments, each constructed in accordance with these rules, may communicate, whether

by double fireproof doors or otherwise, provided that their aggregate cubical contents do not exceed 60,000 cub. ft.

22. Two or more such compartments whose aggregate cubical contents exceed 60,000 cub. ft. can only be allowed to communicate across a fireproof compartment, built up from the basement with walls of solid brickwork, and constructed in all other respects in accordance with these rules so far as the same are applicable, and having all openings protected by fireproof doors at least 6 ft. apart.

23. Except as above no communication allowed between a compartment constructed in accordance with these rules and any other building or compartment.

II.—Standard Fire-resisting Cotton Mills, Flax Mills, Woollen Mills, and Worsted Mills.

Buildings to be deemed of Standard Fire-resisting Construction must conform to the following description.

Height and Area.

1. Height not to exceed four storeys and cellars. The ceiling of the cellar not to be more than 3 ft. above the lowest point of the land level or ground line of the site on which the building stands.

2. Superficial area of any one compartment not to exceed 25,000 sq. ft. internal measurement, excluding area of window recesses and doorways.

N.B.—The height of any compartment, excluding cellar, to be not less than 12 ft., measuring from the floor level to the highest point of the ceiling.

External, Party, and Internal Walls and Partitions.

3. Brick, terra-cotta, and/or cement-concrete composed of broken brick, burnt ballast, furnace slag, clinker or other similar hard and burnt material.

4. No external or party or division wall to be less than 13 ins. thick in any part, or if of concrete 20 ins.

N.B.—Stone used externally only as ashlar or facing, with a backing of brickwork not less than 13 ins. thick, and for dressings, sills, string-courses, and cornices, allowed.

5. All internal partitions to be of incombustible material, excepting only office enclosures of hard non-resinous wood with or without glazing.

6. If there is any building adjoining, the dividing or party-wall to extend at least 3 ft. above the roof of the fire-resisting building.

Flues.

7. All flues to be built of brickwork, no part of which towards the interior of the building is to be less than 9 ins. thick, and all furnace flues to be lined with fire-brick throughout for a distance of at least 20 ft. from the furnace. No timber or woodwork to rest in or be plugged into the brickwork of any flue.

Openings in External Walls.

8. The total area of openings in the external wall of any storey not to exceed one-half of the area of the wall (measured as to height from floor to ceiling of the storey in which the openings occur). All loop-hole or teagle doors and frames and window frames and sashes to be of iron or other hard metal.

9. Every window or other opening opening (whether directly or diagonally) and within 20 ft. of any window, skylight or glazed or other opening in any other building (whether such latter window, skylight or opening be protected or not), or overlooking (whether directly or diagonally) and within 20 ft. of the non-fireproof roof of any building to be protected by "fireproof" shutters or "fireproof" doors which are automatically self-closing in case of fire.

Floors.

10. Brick arches, terra-cotta, fireclay or concrete as above described, the floor being in no part less than 6 ins. in thickness, and carried on metal joists, girders and columns or brick walls or piers.

N.B.—Floors of wood not less than 9 ins. thick, ceiled with plaster or metal lathing, and with the floor boards laid on the bearers without intervening space, allowed.

11. Wooden flooring laid on brick arches, terra-cotta, fireclay, or concrete as above described allowed, provided there is no intervening space. Wooden fillets not exceeding 3 ins. deep permitted if laid on brick arches, terra-cotta, fireclay, or concrete as above described, the intervening spaces being filled with incombustible material.

12. Scuppers to carry off water, the opening of each of which shall not be less in area than 21 superficial inches, to be provided in the external walls to each floor at intervals of not more than 25 ft.

Roofs.

13. Roofs to be entirely of the incombustible materials as described for floors in Rule 10, except that 4 ins. be substituted for 6 ins. in thickness, but there may be erected above them light shelters or roofs constructed entirely of incombustible materials.

NOTE.—Glass not less than 1/2 in. thick in sections not exceeding 36 super. ins., set in iron or other hard metal, and wired glass or electro-copper glazing is accordance with the rules of the Fire Offices' Committee in force when such glazing is provided, shall for the purpose of this rule be deemed incombustible.

Outlets on to roofs rendered necessary to satisfy the requirements of the Factories and Workshops Act permitted, provided that all doors and frames be of iron or cased in iron-plate at least 1/2 in. thick, and that they be self-closing.

Protection of Structural Metal-works.

14. All columns or stanchions to be covered with brickwork or porous terra-cotta (at least 2 ins. thick) or with cement, concrete, or plaster at least 1 1/2 ins. thick, keyed into metal supports and protected by a metal guard up to a height of not less than 4 ft. from the floor where cement, concrete or plaster only used.

15. Girders, joists, lintels, and all structural metal-work (other than columns and stanchions, but including framework of roofs), where not covered with brickwork, to be completely encased in porous terra-cotta at least 2 ins. thick, securely anchored, or cement, concrete or plaster at least 1 in. thick, keyed into metal supports.

16. Space must be left at the ends of girders and joists to permit of expansion.

Linings and Ceilings.

17. No lining of wood or textile fabric to any part of the walls, partitions, ceilings or roof.

Floor Openings.

18. No openings through any floors allowed except holes to admit steam, gas and water pipes, and iron or earthenware tubes for electric conductors. All pipes and tubes to be cemented round the full thickness of the floor.

N.B.—All staircases, hoists, rope and strap races, and gearing towers to be external to the four walls of the building and constructed entirely of brick or cement concrete as above described at least 9 ins. thick.

Hoists must be constructed in the staircase enclosures, and no opening thereto to be less than 6 ft. from any opening into the building. Excepting hoists, the enclosing walls must be carried through and 18 ins. above the roof of the building and the roofs, stairs and landings of said enclosures must be constructed of incombustible material. No openings permitted between the building and the rope and strap races and gearing towers, and each opening from the staircase into the building to be protected by a "fireproof" door.

Shafting through Walls.

19. Shafting where passing through walls to fit closely into wall, or have wall boxes closed with iron plates not less than 1/2 in. thick, leaving no open space.

Pipes and Electric Conductors.

20. All pipes in the building, except water pipes not exceeding 1 1/2 ins. in diameter, to be of hard metal. No wooden casing to be used for enclosing electric conductors.

Communicating Compartments.

21. Two or more compartment, each constructed in accordance with these rules, may communicate whether by double "fireproof" doors or otherwise, provided that their aggregate superficial area does not exceed 25,000 sq. ft.

22. Two or more such compartments, whose aggregate superficial area exceeds 25,000 sq. ft., can only be allowed to communicate across a fireproof compartment, built up from the basement with walls of solid brickwork, and constructed in all other respects in accordance with these rules so far as the same are applicable, and having all openings protected by "fireproof" doors at least 6 ft. apart.

23. Except as above no communication allowed between a compartment constructed in accordance with these rules and any other compartment.

Rules as to Reinforced Concrete Construction.

Buildings constructed with concrete reinforced in every part with embedded metal rods or bars spaced not more than 2 ins. apart, securely connected or overlapping at least 6 ins. at all abutments and intersections, having also bands or bars across the thickness of the concrete, may be deemed of standard fire-resisting construction, provided they conform to the above rules with the following modifications:—

Rule 3.—Concrete may be composed of sand and gravel that will pass through a 1/2 in. mesh, or of the other materials mentioned in the rule, but in any case the cement used must be Portland (equal to the British Standard Specification of December 1904), in the proportion of 6 cwt. of cement to each cubic yard of concrete. The concrete must be thoroughly mixed both dry and wet, and must be rammed round the metal-work in position, every part of which must be completely enclosed with solid concrete.

Rule 4.—No external wall to be less than 6 ins. and no party wall less than 13 ins. thick in any part.

Rule 7.—Flues may be built of reinforced concrete as described not less than 4 ins. thick, if lined throughout with fireclay tubes not less than 1 1/2 ins. thick. No timber or woodwork to be in contact with such flue.

Rules 10 and 11.—Floors must be constructed of reinforced concrete as described not less than 5 ins. thick in any part without woodwork bedded therein, supported on beams and columns of similar reinforced concrete.

Rule 13.—Roofs must be constructed in a similar manner to floors, the concrete in no part to be less than 5 ins. thick.

Rules 14, 15 and 16.—All structural metal-work must be embedded in solid concrete, so that no part of any rod or bar shall be nearer the face of the concrete than double its diameter, such thickness of concrete must be in no case less than 1 in., but need not be more than 2 ins.

Rule 18.—Enclosure to staircase and hoist, if of reinforced concrete as described, may be 6 ins. in thickness.

Rule 22.—Fireproof compartments in connection with reinforced concrete structures must also be of reinforced concrete as described, with walls not less than 6 ins., and floors not less than 5 ins. in thickness.

Rules for the Application of Wired Glass and Electro-Copper Glazing for the Protection of Exposed Openings.

Wired Glass.

1. Thickness of glass not less than 1/2 in.
2. Embedded wire netting not larger than 1 in. mesh.
3. Sizes of squares of glass not to exceed 400 super. ins.
4. Sashes and/or frames: The sashes and/or frames must be entirely of iron or other hard metal securely bolted or keyed into the wall.

5. Setting of glass: The squares of glass must be set in rebates or grooves not less than 1/2 in. in width or depth, with due allowance for expansion, and must be secured by metal fastenings to sashes or frames independently of any cement or putty used for weatherproof purposes.

Electro-Copper Glazing.

1. Thickness of glass not less than 1/2 in.
2. Size of squares of glass not to exceed 16 super. ins.
3. Sectional lights: The squares of glass to be formed by electro-copper glazing into sectional lights not exceeding 4 ft. super.

4. Sashes and/or frames: Sashes and/or frames must be entirely of iron or other hard metal securely bolted or keyed into the wall.

5. Fixing of sectional lights: The sectional lights must be set in rebates or grooves not less than 1/2 in. in width or depth, with due allowance for expansion, and must be secured by hard metal fastenings independently of any cement or putty used for weatherproof purposes.

N.B.—1. No window opening exceeding 60 super. ft. or skylight exceeding 100 super. ft. will be deemed capable of efficient protection by wired glass or electro-copper glazing.

2. Hard metal casements not exceeding 8 ft. super., fitted with wired glass or electro-copper glazing in accordance with the rules and secured to the frames by hard metal hinges not more than 2 ft. apart and by fastenings, at top, centre and bottom, allowed.

Fireproof Doors.

used as a means of separation between communicating buildings and/or rooms, or between buildings and staircases.

Doors to be deemed Fireproof must be in Conformity with one or other of the following Specifications.

Iron Doors.

(a) *Construction.*—Must be made of wrought-iron plate not less than 1/2 in. thick, with styles and rails on each face of the plate not less than 3 ins. in width and 1/2 in. thick, dividing the door into panels not exceeding 2 ft. 6 ins. by 3 ft. 6 ins.

(b) *Must be hung on Hinges* or pivots in a wrought iron rebated frame bolted through, or keyed into the wall (no lead or wood may be used). Sliding doors are not allowed.

(c) *Bolts.*—Must have bolts at the top and bottom (or, if in two leaves, at the top and bottom of each leaf) fastened into the frame.

(d) *Wall Opening.*—Must have floor, jambs and head formed of brick, stone or iron, and must not be more than 5 ft. wide by 7 ft. high; when the opening exceeds 3 ft. 6 ins. in width the door must be in two leaves of equal size.

Metal-Covered Doors.

Construction.

Woodwork.—Must be made of planed, grooved and tongued well-seasoned boards, each 1/2 in. thick, crossed at right angles and thoroughly nailed together with wrought-iron nails, and the nails clinched.

Must be without panels and of the following thicknesses:—

Wall opening not exceeding 28 sq. ft., two thicknesses of boards.

Exceeding 28 sq. ft. but not exceeding 35 sq. ft., three thicknesses of boards.

Exceeding 35 sq. ft., four thicknesses of boards.

Doors for openings exceeding 28 sq. ft. may be of one thickness less than as above specified, provided that inside the tin sheets aforementioned the wood be entirely and securely covered with sheets made of a composition of asbestos and other incombustible mineral ingredients not less than 1/2 in. in thickness.

Metal Covering.—The doors must be completely encased in tinned steel or tinned iron sheets, so that no portion of the wood is exposed. The thickness of the sheets must not be less than No. 26 Standard Wire Gauge, and their size must not exceed 14 ins. by 20 ins.

All joints in the sheets must be lock-jointed and not soldered, and the width of the lock-joints must not be less than 1/2 in. The edges of the doors all round must be covered with sheets turned round at least 2 ins. on each face.

The sheets must be attached closely to the doors with screws or barbed nails which must penetrate at least three quarters of the thickness of the door, and be placed not more than 6 ins. apart. All screws and nails must be inside the lock-joint. The tinned sheets should be left bright; but if it is desired to paint the doors, then white paint only may be used.

Fittings.—All the door fittings and attachments must be of iron. All fittings must be bolted through the doors, and not screwed to them; and all wall attachments must be securely bolted through or keyed into the wall. No lead or wood may be used.

Sliding Doors must overlap at least 3 ins. at the top of the wall opening, and at the sides also unless prevented by a cross wall, in which case the doors must, when closed, come as near such wall as possible. An iron guide must be securely fixed into the wall at the bottom of the wall opening, and a stop must be fixed on the opposite side of the opening and about one-third of the way up so as to keep the door quite close against the wall when closed.

Hinged Doors must overlap at least 3 ins. at the top and sides as in the case of sliding doors, or be hung in a wrought-iron frame having not less than a 1/2 in. rebate, bolted through or keyed into the wall (no lead or wood being used for the purpose).

Wall Opening must have floor, jambs and head formed of brick, stone or iron, and must not be more than 5 ft. high, and the superficial area thereof must not exceed 45 ft.

N.B.—No opening exceeding this size to be deemed capable of efficient protection by doors.

N.B.—An opening in a party-wall having a superficial area exceeding 45 ft. can not be deemed to be efficiently protected by placing a broad band of metal in the centre of the opening and protecting the aperture on either side of the metal band with metal-covered doors, neither of which exceeds 45 super. ft.

Double Fireproof Doors.

Double fireproof doors must be constructed according to the above rules, and must be fitted one on each side of the wall-opening. Sliding doors must be distant from each other not less than the full thickness of the wall, but hinged doors may be fitted flush with the surface of the wall provided that the distance between the doors be not less than 6 ins. One iron and one metal-covered door so constructed and fitted will be deemed equivalent to double fireproof doors.

It is recommended that a sill of from 1 1/2 ins. to 3 ins. thick of hard wood be placed in the doorway to prevent the flow of water from one room to another.

Fireproof Shutters for Windows and other Openings in External Walls.

Shutters to be deemed fireproof must be in conformity with one or other of the following specifications.

NOTE.—No window or other opening exceeding 50 super. ft. will be deemed capable of efficient protection by fireproof shutters.

WARRANTY.—It must be warranted in the policy that fireproof shutters be closed at nights, on Sundays, and at all other times when the rooms are not occupied.

Iron, Steel Gauze and Metal-covered Shutters: Construction.

Iron Shutters must be of wrought-iron or steel not less than $\frac{1}{2}$ in. thick, and must have styles and rails on each face not less than 3 ins. wide and $\frac{1}{2}$ in. thick, dividing the shutter into panels not exceeding 2 ft. 6 ins. by 3 ft. 6 ins.

Steel Gauze Shutters must be of steel wire not less than $\frac{1}{2}$ in. thick and have not less than 64 meshes to the sq. in. They must be securely riveted in a double frame of angle iron at least 1 $\frac{1}{2}$ ins. by 1 in. and $\frac{1}{2}$ in. thick, dividing the shutter into panels not exceeding 3 ft. 6 ins. by 2 ft. 6 ins.

Metal-covered Shutters.

Woodwork.—Must be of at least two thicknesses of planed, grooved and tongued well-seasoned boards, each $\frac{1}{2}$ in. thick, crossed at right angles and thoroughly nailed together with wrought-iron nails, and the nails clinched. They must be without panels.

Metal Covering.—The shutters must be completely encased in tinned steel or tinned iron sheets, so that no portion of the wood is exposed. The edges of the shutters all round must be covered with sheets turned round at least 2 ins. on each face. All joints in the sheets must be lock-jointed and not soldered, and the width of the lock-joints must not be less than $\frac{1}{2}$ in.

The sheets must be attached closely to the shutters with screws or barbed nails which must penetrate at least three-fourths of the thickness of the shutter and be placed not more than 6 ins. apart. All nails or screws must be inside the lock-joint. The thickness of the sheets must not be less than No. 26 Standard Wire Gauge, and their size must not exceed 14 ins. by 20 ins.

Fittings.—All the shutter fittings and attachments must be of iron. All fittings must be bolted through the shutters and not screwed to them.

Fitting-up of Shutters as above.

Sliding Shutters must slide by means of pulleys running on wrought-iron frame. They must have iron guides securely fixed into the wall at the bottom of the opening and a stop fixed on the opposite side of the opening so as to keep the shutters quite close to the wall when closed.

Hinged Shutters—Shutters hung on hinges or pivots must have metal latches or catches, or, if in two leaves, a wrought-iron bar, to keep the shutters close to the wall when closed.

General Rules.

All shutters as above must fit closely on the outside of the window or other opening.

They must (1) overlap at least 3 ins. at the top and side of the opening unless prevented by a cross-wall, in which case the shutters must, when closed, come as near the wall as possible; or (2) close in a wrought-iron rebated frame.

Latches and bars on shutters above ground floor must be operated from both sides.

Wall attachments must be securely bolted through or keyed into the wall. No lead or wood may be used.

Revolving Iron Shutters.

Must be constructed of curvilinear laths of wrought-iron or steel of not less than No. 12 Standard Wire Gauge in thickness, fitted with 1 $\frac{1}{2}$ in. strap hinges not more than 2 ft. apart. The shutter to run in iron or steel grooves not less than 1 in. deep, bolted or keyed into the wall. No lead or wood may be used.

FIRE-RESISTING MATERIALS

Under the London Building Act (Amendment), 1905.

THERE seems to be considerable misunderstanding amongst architects as to one of the features of the London Building Act which has been under investigation during the last session. We refer to the schedule of fire-resisting materials, for this schedule has been considerably altered and, we may say, improved, although we do not favour the absence of some distinction in the Act between "fire-resisting" materials and "incombustible" materials, for in the schedule as it now stands there are again incombustible materials mentioned which are anything but fire-resisting. In this respect we would mention particularly slate, granite and terra-cotta without the modification of porous or semi-porous, for under materials that are fire-resisting should always be understood materials that will stand a high temperature of fire for a considerable period, followed immediately by the application of water under pressure. We present the new schedule herewith.

One of the most useful improvements in the schedule has been the reduction of the thickness of 2 in. hardwood to 1 $\frac{1}{2}$ in. "finished thickness," as there has always been a great deal of trouble on this point, thus allowing the architect to use 2 ins. of wood and get it planed down and properly finished off without running the risk in future of its being condemned as not being 2 ins. thick in the true sense.

WRECKAGE AT A HAMBURG WORKSHOP FIRE.

A novel feature of some importance is the clause which allows practically all wired glass and Luxfer prism glazing as a fire-resisting material, this being the outcome of protracted investigations which occupied some years, and which have now been recently satisfactorily concluded. The limitations as to size in this rule are necessary ones, and fully in accord with the recent experience.

The Schedule.

The following materials shall for the purposes of the Act of 1894, the Act of 1898 and this Act be deemed to be fire-resisting materials:—

(I) For general purposes:—

(1) Brickwork constructed of good bricks well burnt, hard and sound, properly bonded and solidly put together—

(a) With good mortar compounded of good lime and clean sharp sand, hard clean broken brick, broken flint, grit or slag; or

(b) With good cement; or

(c) With cement mixed with sharp clean sand, hard clean broken brick, broken flint, grit or slag.

THE EFFECT OF FIRE ON BRICKWORK.

(2) Granite and other stone suitable for building purposes by reason of its solidity and durability.

(3) Iron, steel and copper.

(4) Slate, tiles, brick and terra-cotta when used for coverings or corbels.

(5) Flagstones when used for floors over arches, but such flagstones not to be exposed on the underside and not supported at the ends only.

(6) Concrete composed of broken brick, tile, stone, stone chippings, ballast, pumice or coke-breeze and lime-cement or calcined gypsum.

(7) Any combination of concrete and steel or iron.

(II) For special purposes:—

(1) In the case of doors and shutters and their frames oak, teak, Jarrah, Karri or other hard timber not less than 1 $\frac{1}{2}$ ins. finished thickness, the frames being bedded solid to the walls or partitions.

(2) In the case of staircases and landings oak, teak, Jarrah, Karri or other hard timber, the treads, risers, strings and bearers being not less than 1 $\frac{1}{2}$ ins. finished thickness, and the ceilings and soffits, if any, being of plaster or cement.

(3) Oak, teak, Jarrah, Karri and other hard timber, when used for beams or posts or in combination with iron, the timber and the iron (if any) being protected by plastering or other incombustible or non-conducting external coating not less than 2 ins. in thickness, or in the case of timber not less than 1 in. in thickness on iron lathing.

(4)—(a) In the case of floors and roofs—Brick tile terra-cotta or concrete composed as described in paragraph (1), (6) of this schedule not less than 5 ins. thick in combination with iron or steel;

(b) In the case of floors and of roofs of projecting shops—

Pugging of concrete composed as described in the said paragraph (1), (6) not less than 5 ins. thick between wood joists, provided a fillet 1 in. square is secured to the sides of the joists and placed so as to be in a central position in the depth of the concrete or concrete blocks not less than 5 ins. thick laid between wood joists on fire-resisting bearers secured to the sides of joists.

(5) In the case of verandahs, balustrades, outside landings, the treads, strings and risers of outside stairs, outside steps, porticos and porches, oak, teak, Jarrah, Karri or other hard timber not less than 1 $\frac{1}{2}$ ins. finished thickness.

(6) In the case of internal partitions enclosing staircases and passages, terra-cotta, brickwork, concrete or other incombustible material not less than 3 ins. thick.

(7) In the case of glazing for windows doors and borrowed lights, lantern or skylights glass not less than $\frac{1}{4}$ in. in thickness in direct combination with metal the melting point of which is not lower than 1,800 degs. Fahr. in squares not exceeding 16 sq. ins. and in panels not exceeding 2 ft. across either way the panels to be secured with fire-resisting materials in fire-resisting frames of hardwood not less than 1 $\frac{3}{4}$ ins. finished thickness or of iron.

(III) Any other material from time to time approved by the Council as fire-resisting.

RECENT FIRE TESTS.

A Girderless Floor.

OF the recent official tests of the Fire-Prevention Committee the one with a German floor, described as being of the "Bremer" system and put forward by Messrs. Faber, of Berlin, is certainly of considerable interest, as it opens up the question of the application of porous brick in combination with metal rods on a principle not dissimilar from that of reinforced concrete. Whether the floor is practicable for English purposes and commercial use is beyond the scope of this notice, but we understand the floor is being considerably used in Germany, where cheap skilled labour is obtainable.

The principle of the floor is that hollow bricks measuring about 6 ins. square and 12 ins. in length are laid side by side, with intervening spaces of about 1 in., and in these intervening spaces rods are placed and the whole then grouted in with cement to form a solid floor.

A floor of this description measuring 22 ft. by 10 ft. in one span was under fire test for a period of 2 $\frac{1}{2}$ hours, followed by the application of water for 2 minutes, the floor being loaded 2 cwt. to the foot.

The summary of this test is as follows, and shows that although there was considerable deflection, namely 3 ins., neither fire nor water got through the floor.

Summary of Effect.

In one minute after the gas was lighted the plaster began to fall, and continued to do so till the end of the test.

On the application of water the plaster to the soffit was washed off where struck by the jet, and some of the longitudinal joints were washed out, exposing the iron rods.

The floor remained in position.

The maximum deflection of the floor was 3 ins.

Neither fire nor water passed through the floor.

On the removal of the load the upper surface of the floor showed one longitudinal and nine transverse cracks and four diagonal cracks at the corners.

THE FIRE-RESISTANCE OF CONCRETE.

WITH the advent of reinforced concrete and its increasing popularity the question of its fire-resistance, as well as that of the fire-resistance of ordinary concrete is being more closely considered than heretofore, and this consideration is certainly very necessary seeing how this matter has been previously neglected.

As a rule the architect will generalize and speak of "cement concrete," giving little heed to whether the requirements of the building necessitate coke-breeze concrete, slag concrete, Thames ballast concrete or otherwise. Similarly, if the architect specifies a ferro-concrete floor, he appears to specify it in general terms or to the specification of some specialist contractor, and again gives little heed to what aggregate would be most serviceable to the requirements he has to meet.

In broad terms, cement concrete is generally described as fire-resisting, and reinforced concrete is similarly described. As a matter of fact, nothing is more dangerous to the safety of a building than reinforced concrete where the metalwork is not suitably protected against the impingement of flame, and where the aggregate has not been selected so as to prevent its flaking off or disintegrating on the application of heat and water. For ordinary concrete work the question of aggregate is likewise of the utmost importance as far as fire-resistance is concerned.

Of the concrete floors in this country that have been tested and found satisfactory, the floor constructed on the Columbian fire-proofing system occupies a front place. This system of fire-resisting floor construction is for all practical purposes a reinforced cement concrete one, the bars being carefully protected from the impingement of flame. In this system a suitable concrete aggregate has been used from the very outset of its introduction in this country. Expanded metal is also another system of reinforcing concrete which is highly esteemed. On the other hand, a Swiss reinforced cement-concrete floor that was put forward for independent investigation failed lamentably, as illustrated in one of our earlier supplements, the reason being that both an unsuitable concrete aggregate was used as also insufficient protection accorded to the bars, which were placed too close to the soffit.

As we go to press the most extensive investigations that have so far been undertaken anywhere upon this question will be in operation at the British Fire Prevention Committee's testing station, where, on the one hand, the Committee, in conjunction with the Associated Portland Cement Manufacturers, Ltd., are undertaking a test with seven variations of concrete aggregates as applied to floor bays, whilst, on the other hand, Messrs. Coignet, of Paris, have put forward a large floor measuring 15 ft. by 22 ft. in order to have the fire-resistance of their ferro-concrete system tested. As to the last-named investigation, it is of course too early to speak until the test has actually taken place, nor are details of the construction of the floor in question yet available, but as to the test with the concrete aggregates in general use we have some further particulars to hand beyond those we have already published giving exact data of what the concrete aggregates comprise, and as this is of general importance we think it is advisable at this juncture to present some particulars as to the construction of the floor in which these seven concrete varieties come under investigation.

If these investigations teach nothing else, they should serve as a warning against the promiscuous use of concrete aggregates that do not lend themselves to fire-resistance.

A REINFORCED POROUS CLAY TUBE FLOOR: VIEW AFTER TEST (FROM BELOW) LOOKING SOUTH.

The construction of the concrete floor may be described as follows:—

The floor was divided into seven separate bays, each bay being in the clear 10ft. long by 2ft. 7ins. wide between the casing of the girders.

There were six girders of 6ins. by 4½ins., weighing 20 lbs. per ft. lineal, the ends being built into the side walls of the hut. Each girder was encased with coke-breeze concrete 8½ins. wide by 10½ins. deep, so as to give a minimum of 2ins. concrete all round the girder.

The bays or slabs of concrete were 5ins. thick, and were quite separate, resting on a 4½in. set-off all round the hut and on the concrete casing to the girders.

The cement used was Portland cement supplied by the Associated Portland Cement Manufacturers, Ltd., London, and described by them as "Ferrocrete," used as a trade name for this particular brand of cement.

The following is a description of the aggregates, giving the amount of aggregate to 1 part by measure of cement in each case:—

(1) *Furnace Slag Concrete.*—Blast furnace slag from the Isip Ironworks, Thrapston, Northampton, broken to pass a 1½in. ring, 3 parts. Clean pit sand from Kent, 2 parts.

(2) *Broken Brick Concrete.*—Broken brick to pass a 1½in. ring, 3 parts. Clean pit sand from Kent, 2 parts.

(3) *Broken Granite Concrete.*—Broken granite, ½in. Guernsey granite chips, 3 parts. Clean pit sand from Kent, 2 parts.

(4) *Burnt Ballast Concrete.*—Burnt ballast, viz., clay from the neighbourhood of Child's Hill, burnt with slack coal, broken to pass a 1½in. ring, 5 parts.

(5) *Coke Breeze Concrete.*—Coke-breeze broken to pass a 1½in. ring (free from fine dust), from the retorts of a London gas company, 5 parts.

(6) *Clinker Concrete.*—Furnace clinker, viz., the raking from the furnaces of large boilers, broken as last, 3 parts. Clean pit sand from Kent, 2 parts.

(7) *Thames Ballast Concrete.*—Thames ballast dredged from the river Thames to pass a 1½in. ring, 3 parts. Clean pit sand from Kent, 2 parts.

In each case the material was turned both in its dry and wet condition, and the concrete to form each slab laid on the centering in a rather wet state, six pails of water being used for each bay, slips of wood being fixed at the sides to retain the concrete in its place and form the necessary spaces.

A FRANKFORT FIRE-STATION.

ALTHOUGH the advent of the motor fire-engine will entirely revolutionize the planning of a modern fire-station, the advent of the motor appliances, as far as Great Britain is concerned, is not likely to be as rapid as in some Continental cities where practically the whole of a city's fire service can, with one stroke of the pen, be transformed into a motor service. The horse is still very much with us, and is still likely to be for a considerable period, and this question of the horse in relation to the horse-drawn fire appliance is one that must yet be constantly before the designers of fire-stations.

Of late there has been a tendency both at home and abroad to break with the tradition of the stable being placed at the back of the engine-room, the door opening and the horse running forward to its place in front of the engine. There has been a tendency to put the horse alongside or slightly in front of the appliance, i.e., to stable the horse in the engine-house.

The latest variation of this principle comes from Frankfort, where the horse is not stabled actually in the engine-house, but instead of being stabled at the back of the engine-house is in front of it, and doors separate the stabling from the engine-house proper.

We therefore give views of the stable and the station generally, and in doing so we would mention that this Frankfort fire-station was designed by the Municipal building department of that town.

NEW FIRE-STATION AT FRANKFORT.

FLAME-PROOF WOOD.

THE remarkable prejudice which has been shown in London against flame-proof wood, more generally known as "non-inflammable" wood, is so extraordinary and so regrettable that we are afraid that when the professional man of the next decade looks back upon the doings of his colleagues at the turn of the nineteenth and twentieth centuries he will be amazed at the short-sighted policy now prevalent.

Our prejudice is, however, shared by our Continental neighbours, so that we are in company and not as isolated as usual in our conservatism. The United States alone have proved the value of having flame-proof wood if it is properly prepared and applied in a business-like manner, and legislation rightly requires its use in the large cities of the United States for buildings of exceptional

fire risk such as tall office buildings and the like.

It has been found in practice that although flame-proof wood is necessarily very much more expensive wood than untreated deal or pine (taking cubic foot by cubic foot), its relatively higher cost is but fractional the moment the labour bill is added, and we can safely say the untreated joinery is but little cheaper than flame-proof joinery, whilst the percentage of additional cost on the total outlay of a building where flame-proof wood is used is infinitesimal.

One of the difficulties in the introduction of flame-proof wood in America was that of obtaining reliable material and getting it applied in a business-like way. It is this difficulty which has probably hampered its introduction into this country, and for this reason it is well to present from the pen of Professor Woolson some particulars as to the

FIRE-STATION STABLES AT FRANKFORT.

methods adopted in New York City in obtaining reliable non-inflammable wood in ordinary building practice. The particulars are the more interesting at the present moment, when we are expecting a new Building Act Amendment Bill for 1906 based on the overmatter of the Bill for 1905, which, whilst dealing with every conceivable form of improvement in building construction from the fire point of view, somehow kept quite clear of any mention of the existence of such a thing as flame-proof or non-inflammable wood, or, as a matter of fact, of even the existence of non-inflammable textiles, which should certainly be compulsory for certain classes of property.

In the schedule of fire-resisting materials, as altered by the Act of 1905 just passed on matters relating to escape from fire, no account has been taken of the fact that properly chemically treated deal or other soft wood is quite as fire-resisting as untreated hardwood, if not more so. Even the British Fire Prevention Committee in its suggestions for improving the London Building Act, which suggestions have been published from time to time, does not appear ever to have made mention of flame-proof wood or to have tackled this subject of non-inflammability. This is the more surprising as flame-proof wood has been under investigation under the auspices of the Committee, and has during the severe ordeals made a very excellent showing. It would indeed be well if the problem were taken up, for even if those who are prejudiced against the material, or say, on account of ignorance of its durability, may argue that it should not be applied in permanent structures, there is not the slightest doubt that it should be used in all temporary buildings and that it should certainly be used throughout the theatre stages of the Metropolis. Granted that permanency has not yet been proved by half a century of constant use—although ten years' experience supplemented by chemical knowledge should be sufficient proof for all practical purposes—there can be no doubt whatever as to its efficiency and durability for all temporary work where as a matter of fact treated wood is very much wanted.

THE CONTROL OF ITS USE IN THE UNITED STATES.

By Professor Woolson.

Regarding the question of obtaining reliable flame-proof wood, the present method of testing as adopted in New York City is described by Professor Woolson as follows:—

When a shipment of lumber is prepared an inspector proceeds to the works and selects at random one sample from every 2,000 ft. of material. This is sent to the laboratory and tested, reports being sent to the Building Bureau and the manufacturer. Two tests are applied to each sample: one a "shavings test," which is a test used by the U.S. Navy, and the other a test devised by the writer, which for want of a better name is called a "timber test."

The shavings test, while useful in a general way to determine the flaming properties of treated wood, is nevertheless unsatisfactory. We are now making series of different tests in an endeavour to supplant it with something more reliable. The test is conducted as follows:—A pan 1 ft. in diameter and 6 ins. deep is mounted on legs. The bottom is formed by a heavy wire screen of $\frac{1}{2}$ in. mesh. This wire bottom is covered with a layer of shavings 2 ins. deep, and a Bunsen burner is applied underneath for twenty-five seconds; then the burner is removed, and the lengths of time during which the shavings support (1) flame and (2) glow are recorded, and also the area of shavings burned.

The idea of this test is that shavings from properly-treated wood will not support flame

any considerable time, and that the flame will gradually die out without material enlargement of the burned area. After test the remaining shavings are thrown away. There are no means for making a permanent exhibit of the results, except by photographs, which would be difficult to take and quite unsatisfactory. The wood must be accepted or rejected on the judgment of the operator, based upon notes taken while observing the test.

Besides these obvious disadvantages, there are two other strong objections to the shavings test—first, the extreme difficulty of always maintaining the same conditions of flame and heat under the shavings; and, second, the impossibility of securing a uniform quality of shavings for tests. The Navy specifications call for the use of the Bunsen burner with a flame giving about 500 degs. C. = 932 degs. Fahr. Now, Bunsen burners vary considerably in the size of flame they produce, so, although every precaution was taken and the same standard temperatures were determined in each of two flames at some definite point, the results of tests upon the same kind of shavings might show widely different figures, because of the general variation in the character of the flames. Much depends also upon how and where the tests are conducted; whether under a smoke hood with a strong draught, or in an open room where air-currents could strike the flame and cause it to sway. The most serious objection, however, to the shavings test, and the one which is fatal to its use as a standard method of comparison, is the impossibility of making the shavings of uniform size and quality.

Shavings made by the same carpenter and as nearly alike as possible are some as fine as sawdust, while others are very coarse with all gradations of size between. Another objection is that in coarse-grained wood like oak the plane in making the shaving splits many of the large pores and allows the crystallized chemical to fall out, thus removing a part of the fire-resisting agent. Lastly, no wood in the form of shavings would be exposed to fire in a building. It would seem that further evidence is unnecessary to demonstrate the inappropriateness of this test alone as a standard of comparison.

To avoid the difficulties of this and similar tests the previously mentioned "timber test" was designed. Though not entirely satisfactory, the results as a whole have been gratifying. During the past two years the writer has conducted over 4,000 tests upon fireproofed wood, the majority being "timber tests." Scarcely any criticism of the method of test has been offered by clients, though the results were often not gratifying.

The specimens for this test are accurately cut to a size $1\frac{1}{2}$ ins. by $\frac{3}{4}$ in. by 12 ins. These "timbers" are tested in pairs by being laid across the top of a 6 in. gas crucible furnace in which a constant temperature of 926 degs. C. = 1,700 degs. F. is maintained. This particular temperature was chosen because it is given by the New York Building Code as approximately the heat of a burning building. At the end of two minutes the specimens are removed and duration of (1) flame and (2) glow noted for each.

The temperature is under constant control by means of a Le Chatelier pyrometer, the "couple" being placed between the two specimens, thus recording the heat exactly at the point of application. The proportions of gas and air are regulated to furnish a vigorous flame 8 ins. to 10 ins. above the furnace, so imitating an ordinary fire.

After test the specimens are sawn in two at the middle and tracings made of the unburned wood. These tracings are then carefully measured by planimeter and the percentage ratios to the original cross-section calculated. The percentage of unburned

wood is printed upon the tracing of each specimen, and then blue prints are made which become a part of the permanent record.

However, the value of the "fireproofed" wood cannot be rated by this feature alone. Account must be taken of the tendency to ignite and support combustion. This is indicated by duration of flame and glow after the specimen is removed from the fire. In every instance the contrast in time of flame and time of glow between the treated and the untreated wood is very marked. The average duration of each taken from 688 tests on four varieties of treated soft woods was 7 secs. and 12 secs. The same data taken from 846 tests on four varieties of treated hardwoods was 10 secs. and 14 secs.

Similar calculations based upon tests of untreated wood, though not averaged from nearly so many tests, gave for soft woods, flame, 1 min. 19 secs.; glow, 1 min. 53 secs.; and for hardwoods, flame, 2 mins. 31 secs.; glow, 6 mins. 29 secs.

Those figures give a ratio of 1 to 11 and 1 to 9 for flame and glow between treated and untreated soft woods, also 1 to 14 and 1 to 27 for hardwoods. That is, the tendency of untreated woods to burn is 10 to 20 times that of treated woods. This measure of the property of retarded combustion is as important as the determination of the percentage of unburned areas, for in the first stages of a fire minutes are valuable. Experience has shown that a variation of 5 per cent. should be allowed in cross-section area, because of structural differences in the wood, fluctuation in temperature, and personal error in measuring. In fact, like all investigative work, it is never safe to estimate average values from the results of a few tests.

The advantages of this method of test are (1) a test piece of uniform size, large enough for practical comparisons and small enough for numerous tests to be made with slight waste of material, thus ensuring a fair average report; (2) a constant temperature and uniform time of application of heat; (3) an estimate of the tendency to support combustion as indicated by the times of flame and glow; (4) the ability to accurately measure the amount of burn and make a drawing of same for permanent record—the specimen itself can also be easily preserved for future reference if desired. In brief, every element of the test is practically constant, except the character of the wood and the treatment it has received. Necessarily these must always remain variable.

The lumber is thoroughly dried before testing, and care exercised to keep everything uniform.

The specimens are placed so that the side which was originally the outside surface of the board faces the fire. This is necessary because the Building Bureau permits rim. outside treatment on floor sleepers and other large materials, which is encased in concrete or a coating of other fireproofed wood.

It will be noted that hardwoods, like long leaf yellow pine, oak and maple, when treated, differ only slightly in unburned area from untreated lumber.

They are naturally "slow-burning" material. It would scarcely be necessary to fireproof hardwood if the preservation of structural strength were the only consideration. But the danger from inflammability should make a surface treatment imperative. Soft woods which waste rapidly under flame should be treated throughout.

Theatre Safety.—The Austrian authorities are conducting a series of experiments regarding the safety of theatres, and a report on the subject will be shortly issued.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

November 1, 1905. Vol. 22, No. 560.

6, Great New Street, Fetter Lane, E.C.

Summary.

Competitions are far too often hushed up, the promoters regarding the profession as a lamb to be fleeced. Assessors also come to illogical decisions and make unfair awards. It is not impossible to find remedies for this unsatisfactory state of affairs. (This page.)

Attention is drawn in the Green Book of the Birmingham Architectural Association to the election to Fellowship, R.I.B.A., without candidates having passed the qualifying examination. "By its own regulations the Institute is required to consult the local societies with regard to such applicants within their respective provinces, but these regulations have been practically disregarded, and, what is worse, the recommendations of the local societies have been ignored when the attention of the R.I.B.A. council had been drawn to the point at issue." (Page 251.)

A large town is in course of construction in the vicinity of Clydebank, the well-known building contracting firm of Messrs. M'Alpine & Son having erected a large number of tenements to house Messrs. Singer's employees. (Page 253.)

Mr. Munro-Ferguson has been building wooden cottages on his highland estates—one type, for gillies, costing £120 inclusive, and the other, for foresters, costing £135. In County Dublin a number of cottages have been erected for the Rathdown Rural District Council at a cost varying from £145 to £170, and others for the Omagh District Council at a cost varying from £110 to £150. (Page 249.)

The most important new scheme brought forward in Manchester for many years is that presented to the City Council by a special committee appointed in 1902. This is the rebuilding of about 25 acres between Oldham Street, Victoria Street, Market Street and Cannon Street, and the provision of a new road parallel with Market Street, which is to relieve that crowded thoroughfare. (Page 254.)

The number of students at the important school of arts and crafts established by Mr. Ashbee at Campden, in Gloucestershire, has quadrupled during the past three sessions, the total number being now 205. (Page 258.)

The Wall Paper Manufacturers, Ltd., have had another successful year, and will continue to pay 8 per cent. on their ordinary shares. (Page 253.)

The Glasgow Institute of Architects hardly see their way to side with the master-masons in protesting against the use of terra-cotta instead of stone for the Royal Infirmary reconstruction, but they consider it advisable that the stone should be used on the frontage to Cathedral Square. (Page 258.)

Fraudulent Competitions.

It is time that the evils of competitions, now continually with us, were eradicated. Everyone must be heartily tired of the wrangles over one competition and another that go on in the architectural profession. Every petty little church committee or small rural council seem possessed with the idea that they can get designs on the cheap by promoting a competition. Having secured designs to look at, they hand the work over to some local acquaintance and ask him to amend his design in conformity with ideas that have been obtained from the plans submitted. They seem to regard the architectural profession as a lamb to be fleeced. Everything is done in a hole-and-corner way. A small advertisement appears in the press; very often no assessor is appointed; an exhibition of the designs is seldom held (or, if it is, the competitors and press are not informed of the date of it); and no public announcement of the decision is made. As competitors are a divided body, the malpractices of the promoters are hardly ever brought to light. The press is the only channel of communication for competitors to take any decisive action, and the press is advisedly kept ignorant. We for one, however, mean to do our best to stop this. We invite the co-operation of all competitors to furnish us with information. We are making special efforts to obtain it ourselves, and we mean to run these offenders to earth. The self-deception of certain members of the public in regard to the promotion of competitions for architectural work is remarkable. We cannot understand how church committees can thief ideas and yet satisfy their consciences. Perhaps they follow the model of Uriah Heep, thinking that the architectural profession deserves any degradation it may receive at their hands for being so foolish as to be caught with chimerical bait. The Competition Reform Society was appointed to effect some alteration in the present system, and it endeavours to obtain information and to warn competitors where no professional assessors are appointed and where no guarantees are given. This body has done much, but there are many small competitions in which a few architects are invited to submit designs, and not being open, little can be done in the way of protest against unfair conditions. It is apparent that if anybody asks for designs from the public they must take some responsibility. We say nothing of the great amount of fruitless labour that they may

entail upon a certain section of the profession, because competitors knowingly take the risk and competitions are not essentially bad, because they help to discover talent and serve as a training ground where the novice can measure his strength against men of position and experience; but it is only common honesty that the promoters should give a fair award and take care to see that the assessor is a man of experience, so as to give satisfaction; then to furnish the public, through the press, with every information so as to prevent abuses; to hold a public exhibition; and finally to return all designs to their authors without undue delay.

Faulty Assessing.

THERE is another matter, however, apart from the promoters, which has attracted our attention recently. It is the illogical decisions of assessors well-known in the profession as men of eminence and experience, whom it is surprising to see giving unfair awards. They should stand by the conditions of the competition to the very letter. Very often, however, one finds that the winning design does not conform to the most important condition, namely, cost. Judgment should always be primarily based upon the planning. Elevations are to a great extent matters of taste, but many assessors will sacrifice convenience in planning and economy to a pleasing elevation. Then again the assessors have friends, and while on the one hand we sometimes find them favour the design of some intimate acquaintance undeservedly because of their natural appreciation of his efforts beyond those whom they do not know; on the other hand, they may fear what would be said by the profession and debar this particular competitor from the award. It would be best if the assessor's name were published in connection with the competition from the start, and his friends could refrain from entering if they chose to do so. But of course this is hardly a solution of the difficulty, and we think that the Institute might draw up some list of assessors for certain classes of work, preferably architects who were not in practice, who would thus feel themselves more in the position of judges (such as on the Tribunal of Appeal under the London Building Act or the London Chamber of Arbitration) and would take care to hold themselves aloof from anything which might suggest favouritism. Perhaps the best way out of this difficulty would be to have two, or preferably three, assessors to each competition.

GILLIE'S COTTAGE IN THE HIGHLANDS,
COSTING £120.

CHEAP COTTAGES.

Scotch, Irish and English Examples.

SO much interest has been taken in the matter of cheap cottages that we have gathered together in the present article some examples from Scotland and Ireland, together with photographs of cottages at Letchworth not hitherto illustrated in our columns.

The timber cottages in the Highlands are of the bungalow type, and contain in the one case two bedrooms and in the other three rooms which might serve as bedrooms. In the first, however, there is a recess in the living-room which could be used for a bed.

The Irish cottages, it will be noted, belong to a somewhat different type of plan to most of those at the Letchworth exhibition, although there were a few which adopted the bedroom on the ground floor. Mr. Clough's cottage, the winner of the prize for the "cheapest cottage in the exhibition," adopts this same means of overcoming the difficulty of more space being required for bedrooms than on the ground floor, when only living-room, scullery and offices are provided; but the relegation of these offices to a back addition, as in the Irish cottages, is not so cheap as the square form of plan.

We illustrate on p. 251 Mr. Allen Foxley's cottage at the Garden City as a workman-like design, although the roof is too much cut about to be economical and a simpler roof would have been much better. The cost of this cottage under the exhibition conditions was slightly less than the £220 allowed in Class 4, and Messrs. Bowman & Sons, the builders, have offered to duplicate it in pairs at a town on the coast of Kent at £260 each. The work was done without contract.

A solution of the difficulty of providing for the very poorest is offered by Messrs. Henman & Cooper. Their cottages at Letchworth have only quite recently been completed. We give a photograph and plan of

the single cottage on p. 251. In this the bedrooms, if they can be so called, are extremely small, and it does not seem to us that the solution is a particularly satisfactory one. The cottages by Mr. Crickmer (see

p. 250) are of different types; that having a living-room, scullery and two bedrooms seems to us to be a much better plan than Messrs. Henman & Cooper's. The cost of £100 was exceeded by Messrs. Henman & Cooper, though it is difficult to see why this could not be lowered if several were erected, but we certainly think such a plan as that of Mr. Crickmer could be erected within that sum. It is apparent that a cottage with one floor such as provided by Messrs. Henman & Cooper is not an economical form, as the roof is double the area that would be needed with two floors giving the same accommodation; while the fact that it is not an exact square, but has an addition containing the sink, w.c., &c., means that the walls are greater than would be required by a square plan to enclose the same area.

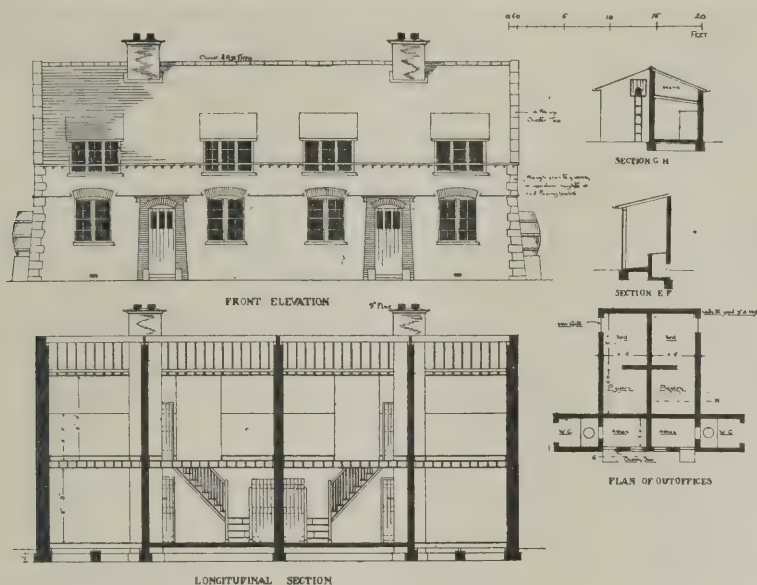

FORESTER'S COTTAGE IN THE HIGHLANDS
COSTING £135.

The fact that the cost of the four cottages is given by Mr. Crickmer at a lump sum of £600 (the builder's estimate) does not enable us to compute the cost of each type of cottage therein included. We have already referred to the type with two bedrooms. It will be seen that another contains four bedrooms, which is rather beyond what is asked for £150. The other two cottages in the group contain three bedrooms. One of the features of this plan is the fact that the earth-closets are reached under cover, but it will be noticed in this connection that the staircases from the bedroom floors are in such a position that one needs to pass through the living-rooms, which is undesirable. In the two-bedroom plan, however, this is not so.

Mr. A. H. Clough's prize cottage (p. 252) is commendable. Our readers will recall the remarks by the judges respecting the weatherboarding. Their suggestion was that this was a mistake, and that tiles would be as cheap. It will be noticed in the working drawings which have been kindly furnished us by Mr. Clough Williams-Ellis that the design has been amended in regard to this.

The roof section of Mr. Clough's cottage on p. 253 is that which has been adopted for a number of his cheap cottages in Sussex and elsewhere; it is the same also as used in the double cottage at Letchworth illustrated on p. 58 of our issue for August 2nd last, though not precisely for the single cottage shown on p. 252 of the present issue. It is interesting to note that this very section was refused three times by the Abingdon Rural District Council when submitted for a home for feeble-minded to be erected near Oxford (the architect for which was Mr. Williams-Ellis), on the ground that the lower member of the Mansard was a wall and should be built of brick.

PHOTOGRAPH OF A SINGLE COTTAGE.

The trustees for whom the home was to be built did not care to fight the matter, and therefore decided to alter the plans and build worse rooms at greater expense.

Wooden Cottages in the Highlands.

In providing cottages for his estate employees in the Highlands a new departure has been taken by Mr. Munro-Ferguson, M.P. for Leith Burghs. He owns two landed estates—one at Novar in Ross-shire and the other at Raith in Fifeshire. Hitherto stone has been used for cottages on Scottish lands. In most districts there is a quarry which, although not workable at a profit, is good enough for estate needs. Mr. Ferguson, however, is an enthusiastic aborigiculturist, and has a large acreage of excellent timber on his Highland property, and he has decided to build his cottages of this timber. So far two types of cottages are tenanted. The plainer design is for gillies, or keepers, and the better-looking cottage for the forester. The photographs on the opposite page show what they are like; the accommodation is shown by the sketch plans. Outwardly they are not particularly attractive, and as yet it is impossible to say how they will answer. The timber is creosoted, 1 gallon of oil being forced into each cubic foot of timber. The foundations are of concrete 15 ins. thick, special care being taken to exclude damp. The back and front walls are 7 ft. high and the ceilings give 9 ft. headroom. The smaller type of cottage has two good-sized rooms, one containing a bed recess, and there is a light bed-closet. The price of this cottage is stated to have been £120, including everything, while the cost of the forester's cottage is put at £135, the latter being not only more commodious but having a roof of galvanized iron. In the gillie's cottage both the roof and the walls are of timber. The forester's cottage has two large rooms and two light bed-closets. The single chimney serves both rooms.

Irish Cottages at £145 to £170.

On this page are given elevations, plans and sections of a pair of labourers' cottages, numbers of which have been erected in the Rathdown rural district (South County Dublin) under the direction of the architects, Messrs. Doolin, Butler & Donnelly, of 12, Dawson Street, Dublin.

Building in and around Dublin is dearer than in most provincial districts in England. These cottages have been completed at a cost varying from £145 to £170, according to the locality and convenience to a railway station. They are nearly all built of local granite rubble masonry walls, cement rendered, and then pebble-dashed in mortar outside. The inside walls and ceilings are plastered throughout. The roofs are covered

COTTAGES ERECTED FOR THE RATHDOWN URBAN DISTRICT COUNCIL (CO. DUBLIN).
DOOLIN BUTLER AND DONNELLY, ARCHITECTS.

with thick, heavy, rough Irish slates. The chimneys are of red facing bricks built with a batter. The accommodation consists of a kitchen 16 ft. by 12 ft., principal bedroom 12 ft. by 11 ft. 6 ins., small scullery, pantry and fuel store. Upstairs there are two attic bedrooms, 12 ft. by 16 ft. and 16 ft. by 11 ft. 6 ins. respectively, the height to wall-plate being 4 ft. 6 ins. In a few cases these houses have been built of concrete at a slightly less cost, but, generally speaking, the architects prefer the granite whenever they can get it, as they find it makes a warmer house.

They have built about eighty-six of these houses for the Rathdown Rural District Council under the Irish Labourers' Acts, and have in hand a further scheme for seventy-five. Messrs. Doolin, Butler & Donnelly have built a number of houses somewhat smaller for the Omagh District Council at a cost ranging from £110 to £150, and similar houses have been built in large numbers by other architects in every part of Ireland. Messrs. Doolin, Butler & Donnelly say they are convinced that there is no necessity to have recourse to cheap and temporary materials. "Our experience leads us to feel that the way in which economy may best be effected is by extreme simplicity of plan, and

that as a rule too much of the accommodation in English labourers' cottages is lost in sculleries, pantries and similar offices, desirable as these may be when the strictest economy is not essential."

With each of the Rathdown cottages there is given a plot varying from one rood to a statute acre in extent, according to the requirements of the labourers of the locality and the spare time at their disposal for tilling it. Of course in a few cases where the land is valuable a rood or even half a rood only is given.

Included in the contract are also small out-offices, comprising a piggery, hen-house, asphalt and sanitary accommodation, built of masonry or concrete and floored in concrete. The fencing of the sites is, not included in the contract. Iron fencing is generally used, at a cost of about 3s. per yd. lin. In Omagh district the architects use a sod fence consisting of bank and ditch, with "quicks" planted on the side of the former. The cost of such a fence is about 2s. per lineal Irish perch. The rents, inclusive of land, vary from 1s. 6d. to 2s. per week. The capital outlay on the scheme is obtained on loan from the Treasury and repayable in thirty-five years. There is of course a deficit, which is met out of the rates.

Materials used in Mr. Clough's Prize Cottage (No. 71) at Letchworth.

Concrete.			£ s. d.

Writing to the "Times" in reply to Mr. Clough's criticism of his cottages (see last week's issue) Earl Carrington says: "The gravamen of his charge seems to be that by building a good substantial labourer's cottage for £150 I have done and am doing what he apparently has been unable to accomplish himself. I have this week accepted a tender of £300 from Mr. Wilford, of Newport Pagnell, for the building of a pair of 'Carrington cottages' to replace those destroyed by the recent fire in the village of Castlethorpe, which I shall be delighted to show Mr. Clough when finished."

Mr. Henman's Cottages.

As regards the cottages by Messrs. Henman & Cooper, FF.R.I.B.A., they estimate that under favourable conditions they could be built at an average of £100 per cottage, but they were faced with difficulties at Letchworth. The Garden City Co. and the local authority made requirements which added to cost, and there was difficulty in getting a builder to undertake the work at all. They are not yet able to give the total cost, but it has somewhat exceeded £100 each. It must, however, be noted that they did not strive to get the cheapest possible structures; also that they declined to compete in any class of the exhibition. In 1876 Mr. Henman propounded plans on the principle of these cottages in a paper entitled "Economic Construction of Dwellings for the Working Classes," and although much has since been done for the better class of artizan, comparatively little progress has been made in providing for a very numerous class of

BIRMINGHAM ARCHITECTURAL
ASSOCIATION.

Green Book.

THE Green Book of the Birmingham Architectural Association for the current session has just been issued. In the course of the annual report for 1904-05, dealing with various professional matters, the council draw attention to the procedure of the R.I.B.A. council in its elections to Fellowship of the Institute—about which other societies have expressed disapproval, more especially the Associates at Leeds. The Birmingham council say:—

"It has been felt pretty generally, not only by our own but by other affiliated societies, that the R.I.B.A. council exercises no efficient discrimination as regards the qualifications of applicants for direct admission to the Fellowship who desire to escape the test of the qualifying examination imposed upon all new Associates. By its own regulations the Institute is required to consult the local societies with regard to such applicants within their respective provinces, but these regulations have been practically disregarded, and, what is worse, the recommendations of the local societies have been ignored when the attention of the R.I.B.A. council had been drawn to the point at issue. The

workers who now are compelled to live in separate rooms of tenements constructed for only a single family, and in which there is only one set of sanitary conveniences and cooking accommodation, which have to be used by several families. Messrs. Henman & Cooper's cottages provide the smallest possible accommodation, but each gives a complete home, with all necessary domestic and sanitary conveniences. For city and town use the plan can be adapted to tenement dwellings in flats, two dwellings being entered off each staircase landing.

Mr. Houfton's Cottage.

On pp. 254-256 of this issue will be found the working drawings of the cottage designed by Mr. Houfton, which secured the £100 prize for the best £150 cottage, together with detail drawings which explain the design fully. The plan is a good one, and difficult to improve upon without entire reconstruction and losing some advantages which would be thought by some to be more desirable than any other advantages gained.

The new Parish Church at Dundivan, Coatbridge, the memorial stone of which was laid on Saturday last, is built of red stone from Closeburn Quarries, Dumfries, and has been designed by Mr. Alexander Cullen, F.R.I.B.A. The building has a well-proportioned tower surmounted by a Scots crown and provided with a bell. The cost of the church is £10,000.

COTTAGE AT LETCWORTH. ALLEN FOXLEY, ARCHITECT.

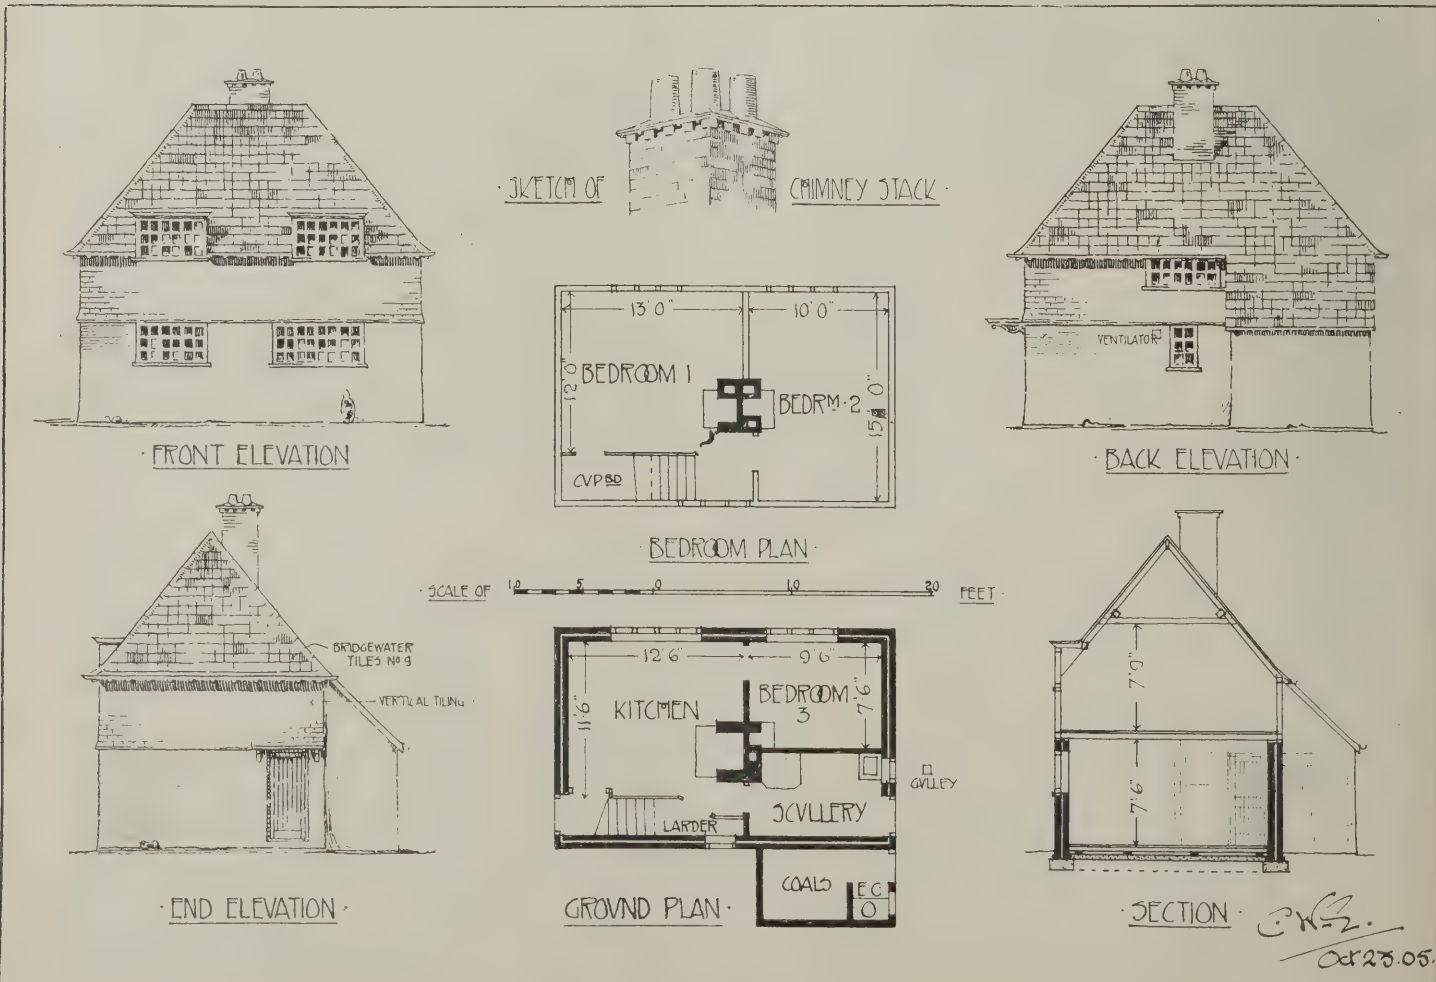

council of the Institute therefore drew down upon themselves the adverse vote which in some cases nullified their nominations for the Fellowship."

The Birmingham council have also taken action with regard to protecting the interests of Birmingham architects when the proposed council house extension scheme becomes ripe for detailed consideration. It was felt that there might be a considerable risk of an appointment being made which would entirely disregard the claims of local architects to, at any rate, a competition with outsiders for the work. The president interviewed the late Lord Mayor on the subject, and secured a promise that the question should be brought before the special committee dealing with the matter. The promise was fulfilled, and though the Birmingham Association have received no definite reply, it is understood that their request will be complied with.

With regard to registration the council observe that the recent elections to the Institute council would appear to be unfavourable to an early settlement of this much-debated question.

The programme for the current session is as follows :—

- Nov. 3rd.—Presidential address.
- Nov. 17th.—Mr. R. Catterson-Smith on "Ornamental Design, and how it should be taught."
- Dec. 1st.—Mr. J. Starkie Gardner on "Metal applied as External Decoration to Buildings."
- Dec. 15th.—Mr. J. A. Gotch on "The Homes of Queen Elizabeth's Courtiers."
- Jan. 5th.—Mr. Mowbray A. Green on "The Eighteenth-century Architecture of Bath."
- Jan. 19th.—Address by Mr. E. C. Middleton.
- Feb. 2nd.—Mr. H. V. Lanchester on "Cardiff Municipal Buildings."
- Feb. 16th.—Mr. Percy S. Worthington on "Homes of the Monks during the Middle Ages."
- Mar. 2nd.—Prof. Beresford Pite on "Architectural Effect in Cities."
- Mar. 16th.—Lecture to be announced.
- Mar. 30th.—Mr. J. Ward on "An Excursion to Mont St. Michael."

MR. A. H. CLOUGH'S PRIZE COTTAGE (NO. 71) AT LETCHWORTH.

Competitions.

Competition for new School, Carlisle.—On Wednesday last it was decided by the School Management and Building Joint Committee to recommend to the Education Committee for acceptance the following report on the competitive designs for the Norman Street schools. The first premium (of £75, to be merged in the usual commission) to Messrs. Oliver & Dodgshun; the second of £30 to Mr. F. Lishman; and the third of £20 to Mr. J. W. Benwell—all of Carlisle. Accommodation for forty defective children is included in the design, the total cost of which is estimated at about £12,000. Five designs were submitted. Mr. W. H. Brierley, of York, was the assessor.

Shop Fronts.—Messrs. W. H. Smith & Son, the well-known railway bookstall newsagents, &c., of 186, Strand, London, W.C., recently promoted a competition for designs for shop fronts, offering a prize of £75 for the best. This firm has now decided that the drawings sent in by Messrs. J. & J. B. Ednie, of 81, Ashley Terrace, Edinburgh, and Mr. James W. Morton, of 13 Wellington Square, London, S.W., are equal in merit. In these circumstances they have added £25 to the prize, and with the consent of the two competitors in question have awarded £50 to each of them. We are informed that the designs will not be exhibited, nor do Messrs. Smith propose to have them photographed by any journal. The latter resolve we can appreciate, but it was only fair to the competitors to have given them an opportunity of judging whether the award was a fair one; and as Messrs. Smith have apparently acted with the best intentions, it is only to be regretted that they should have followed the same secretive policy that has too often cloaked unfair awards. Their policy, too, in putting competitors to the additional trouble of applying for the drawings before returning them is also faulty.

Competitions for Schools, co. Durham.—The Durham County Education Committee recently invited about thirty architects to submit designs for three proposed elementary schools, and the award has just become known. The largest school, to be built at Shildon, provides accommodation for 350 infants, 350 girls and 350 boys, with special cookery, science and manual training rooms. The design placed first (5 per cent. commission) is by Mr. R. Holt, Liverpool; the second (premium £20) by Mr. F. Rennoldson, South Shields; and the third (premium £10) by Messrs. Vaux & Marks, Sunderland. No premiums were offered for the Sedgfield and the Eldon Lane schools, but the winners were to carry out the work and receive the usual commission. The Sedgfield school accommodates 360 mixed and 180 infants. The winning design is submitted by Messrs. Hind & Horsbery, Liverpool; the second by Mr. J. H. Morton, South Shields; and the third by Messrs. Vaux & Marks. The Eldon Lane school provides for 200 mixed and 150 infants, but provision had to be made for a possible future extension of fifty in each department. The successful architects are Messrs. Vaux & Marks; the second Mr. J. A. Wilson, West Hartlepool; and the third Mr. R. Holt. It was a condition that all classrooms should open directly into the central hall, and that no design should exceed in cost £10 per head, plus an extra allowance of 15s. per sup. ft. for central halls and special classrooms. A margin of 2½ per cent. above the architect's estimate for the total cost is given for the actual carrying out. No assessor was named, but the committee have been assisted in adjudicating by their architect, Mr. W. Rushworth, F.R.I.B.A. It was owing to the pressure of work in Mr. Rushworth's departments that these competitions were held.

Builders' Notes.

"The Holy City."—With mushroom-like rapidity a large town has sprung up in the vicinity of Clydebank, the well-known building contracting firm of Messrs. M'Alpine & Son having erected a large number of tenements for the housing of the employees at Singer's factory. The tenements are known as the "Holy City" on account of the position they occupy on the brow of the hill above Singer's works.

Irish Slate Quarries.—The Fouchil and Templebryan Slate and Flagstone Quarries, co. Cork, have been in existence for more than a century, during which long period they have been steadily and profitably worked by the Kingston family. Fouchil slate is said to be quite equal to anything coming from Penrhyn or Portmadoc, not to speak of the famous products of Killaloe. It is a good, hard, sound slate of a dark bluish shade and is well suited to resist all kinds of weather. At the present time, owing to the scarcity of labour, the proprietor, Mr. Kingston, finds it almost impossible to meet the demands. It is suggested that a good opportunity is offered for a company or syndicate to take over and work the quarries.

The Wall Paper Manufacturers, Ltd., have had another successful year. From the commencement of the combine, in 1899, the ordinary shareholders have received 8 per cent., and the directors have decided to retain this rate, though the profits would admit of the full 10 per cent. on the ordinary shares and up to 9 per cent. on the deferred, of which £1,084,621 has been subscribed and called up. The nett profits show an increase of £1,435, while the amount brought into the accounts is £33,527 larger than the corresponding figure last year. The reserve has been augmented by £50,000, as against £30,000, bringing the total up to £180,000.

Registration of Plumbers.—At a large public meeting held at Newcastle-on-Tyne

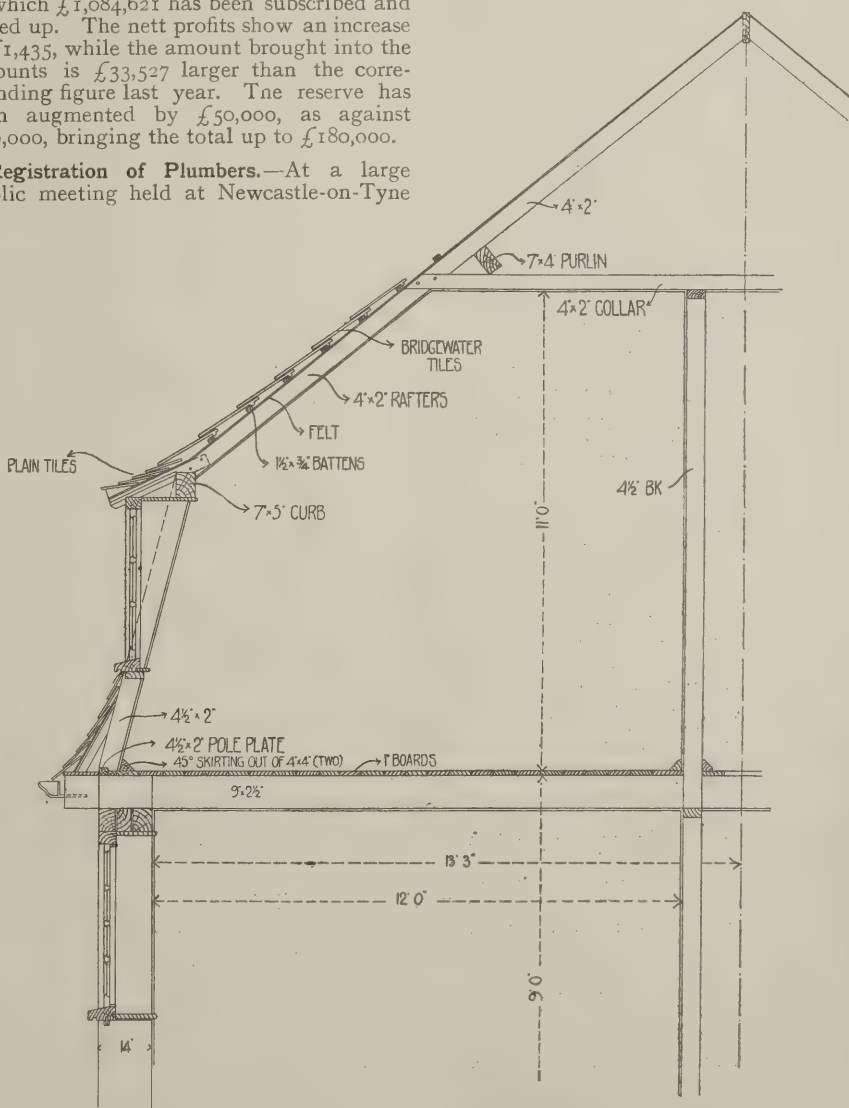

on Friday night the following resolution was unanimously carried: "This public meeting of members of the corporation, architects, plumbers and inhabitants of Newcastle-on-Tyne and the district desires to record its hearty approbation of the action of the Worshipful Company of Plumbers, London, in establishing the national registration of plumbers, with combined systems of apprenticeship, education and examination for plumbers, in order that their competency and responsibility may be duly ensured consistently with the important duties devolving upon plumbers under the regulations of the public health and water authorities."

Views and Reviews.

A new Book on Sewers and Drains.

We reviewed in our columns a short time ago the necessarily portentous work of Messrs. Macmorran, K.C., and Willis on the law of sewers and drains, and now comes a treatise upon the same subject by Mr. A. P. Poley, barrister-at-law. Mr. Poley's work is, however, less ambitious, and is mainly directed to the elucidation of the terms "sewer" and "drain" as they occur in the various statutes and cases dealing with this important and complicated subject. For this reason the work will be valuable to many of our readers, though the necessity for so much literature on the subject is one of the standing disgraces of our English law.

"A treatise upon the law affecting sewers and drains," with plans, by Arthur P. Poley, B.A., of Inner Temple, E.C. London: Eyre & Spottiswoode, East Harding Street, E.C., price 5s.

DETAIL OF MANSARD IN ONE OF MR. CLOUGH'S COTTAGES.

MANCHESTER NOTES.

(By our Own Correspondent.)

THE building trade in the Manchester district is not good and the prospects for the winter are not altogether encouraging, though many worse times have been experienced. The most important building contract in hand is the new infirmary. At the Stanley Grove site 400 men are engaged, and the work is now making rapid progress. The town hall at Stockport is also a scene of great activity, and is an instance of the most energetic and up-to-date methods of erection. In connection with the extension of London Road Station (L. & N.W.) and the widening of the line to Ardwick, only the preparatory demolition has yet been accomplished. Considering the pressing need of the work, the railway company appear to be moving in most leisurely fashion, but this company is not noted for undue haste in the making of improvements.

A Great Scheme.

The most important new scheme brought forward in Manchester for many years is that presented to the City Council by a special committee appointed in 1902. This is the rebuilding of about 25 acres between Oldham Street, Victoria Street, Market Street and Cannon Street, and the provision of a new road parallel with Market Street, which is to relieve that crowded thoroughfare. The property to be pulled down is mostly of old type, the streets and alleys are narrow, and the block as a whole is, at present, no credit to the city. Under the scheme the new street running down the centre of the plot from Oldham Street to Victoria Street would be from 16 yds. to 20 yds. in width. It is proposed that the buildings between it and Market Street shall be of the arcade type. The design prepared by Mr. Price, the city architect, shows footway bridges along the new thoroughfare on the first level, so that there could be a double row of shops. Stairways at convenient intervals would give access to the upper floors. It is proposed that the Corporation acquire the property under parliamentary powers, subsequently delegating to syndicates the actual building. The total estimated cost is £1,300,000, but the nett cost, after allowing for the sale of residue lands and the value of chief or ground rents, is put at £250,000. This great scheme is the alternative to a proposal made some years ago that the work should be done by a private company, who prepared and presented to Parliament a Bill with this object. The scheme will undoubtedly meet with strong opposition.

Foreign Granite in Manchester.

The first foreign manufactured granite for building purposes erected in Manchester is now in position at the new Stock Exchange. As it happens, a similar type of granite work has recently been supplied from Cornwall to the Victoria Station extension, and in the new buildings of the Co-operative Wholesale Society Scotch granite is being erected. There is, therefore, an excellent opportunity of comparing the three kinds. The most cursory glance is enough to reveal the inferiority of the foreign worked material, from every point of view except cost. The stone itself is of a dingy, indeterminate colour, the workmanship is rough, and the joints are of all widths. Apparently the first cheapness of the material will have been largely discounted by the extra cost of setting. It really seems unfair to put British makers and British standards in competition with such work as this.

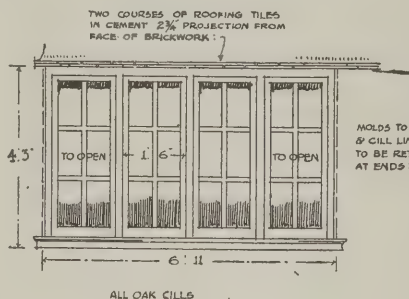

A new County Asylum for Surrey is being erected at Merstham. Mr. G. T. Hine is the architect. It is to accommodate 900 patients in the first instance, and subsequently 1,200. Messrs. J. Bowen & Sons, of Birmingham, are the contractors for the work.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions must in all cases be addressed to the Editor and be written on one side of the paper only.

Books on Hydrostatics and Arbitrations.

BROMLEY.—H. E. G. writes: "Which are the best text-books on hydrostatics and arbitrations to study in connection with the Surveyors' Institution Fellowship Examination?"

Lardner's "Handbook of Hydrostatics and Pneumatics," by B. Lowey, price 5s., post free from our offices; Redman's "Law of Arbitrations and Awards" (Butterworth & Co., publishers).

Setting-out an Elliptical Arch and Determining Length of Special Hip Rafter.

BRADFORD.—MODULE writes: "Please show the best way to set out the joints of a stone elliptical arch and how to obtain the true lengths of hip rafters when the roof is hipped back at a different angle to the main roof."

Fig. 1 shows alternative methods, A and B, of setting-out the joints of an elliptical stone arch. First set out the span ab and rise cd , then with a pair of compasses take length ac and with centre at d strike arcs cutting ac and cb in points e and f , which are the foci of the ellipse. Now set out the ellipse, by means of a trammel for preference, and the outline of the intrados will be obtained. In method A it will be seen that the size of each voussoir decreases as the centre of the arch is approached. This is brought about as follows:—Taking any convenient radius in a pair of compasses and with centre c strike arc gh , then step off on this arc points 1, 2, &c., according to the number of voussoirs it is required to have in the arch (in this case 11), always remembering that the number should be odd in order to obtain a keystone and not a joint in the centre. Having obtained the points correctly, a line from c produced through any point 4 will cut the ellipse at k , where a joint will occur. In method B the joints m, n , &c., are obtained by trial by stepping along the ellipse with a pair of dividers; this method produces voussoirs more nearly of one size. The method of finding the angle of the joints, which should be normal to the curve of the ellipse, is as follows:—Having obtained the required positions of joints by either of the above methods, say point p , join same to the two foci e and f , then bisect the angle between these two lines by the line gq and produce through, cutting off the length pr according to the length of joint decided upon. Then horizontal and vertical lines give the junctions of the voussoirs with the wall. For the second question on length of hip rafter, draw the plan of roof as in Fig. 2, leaving out the plan of hip rafters for the present, and producing ridge line indefinitely. Next set off a cross-section of the main roof as in Fig. 3, assuming the slope to be 30 degs.; this will give the height to ridge (h). Now assuming the end to be hipped at 45 degs., set out the horizontal section, Fig. 4, making the height equal to h in Fig. 3; then the point where the 45 degs. line cuts the ridge line may be produced up to Fig. 2, as shown by dotted line, until it intersects the indefinite ridge line already drawn in point c . This point may now be joined to the two corners a and b giving the plan of hip rafters. From point c

SETTING-OUT ELLIPTICAL STONE ARCH.

DETERMINING LENGTH OF HIP RAFTER.

set out at right angles to cba a line cd equal to the height h in Figs. 3 and 4. Join d to b , which will be the true length of hip rafter.

HENRY ADAMS.

Flow of Water in Pipes.

STIRLING.—A. W. writes: "A reservoir, say 30ft. high, gives a pressure of 40lbs. at the basement of a house. If a supply pipe 38ft. high and $\frac{3}{4}$ in. bore were taken from basement to upper floor, what would the pressure be at the upper floor? Is there any formula for this? Please name a good book on hydrostatics."

In solving questions upon the flow of water in pipes there are certain general principles to bear in mind. The statical pressure, that is, when there is no draught from the pipes and everything is quiescent, is due simply to the difference in level between the highest standing point of the water and the place of measurement. This is called the head, and is measured in feet. The pressure per sq. ft. at the bottom is the same as if the water were piled up vertically to the height of the head, and as water weighs, say, $62\frac{1}{2}$ lbs. per cub. ft., the pressure (P) per sq. ft. for any given head (H) will be $P = 62\frac{1}{2} H$. It is, however, more convenient to measure the pressure in lbs. per sq. in.; $62\frac{1}{2}$ will therefore be divided by 144, making 0.434 for the constant. Then the pressure in lbs. per sq. in. = $0.434 H$. When the water is flowing there will be water due to friction against the interior surface of the pipe, to energy absorbed in passing bends, branches, valves, &c., to eddies produced by irregularities in diameter and shape of flow, and to draught from intermediate points, for all of which no precise value can be fixed. Before any flow can take place there must be an unbalanced pressure at the outlet, as occurs when a tap is opened. The flowing stream is urged by the weight of water behind, or, in other words, by the head. A small part of this head goes to produce the required velocity at the outlet and the remainder to overcome the friction and other losses. The amount of head required to produce the velocity is measured by

the formula $H = \frac{G^2}{215d^4}$, where H = head in feet, G = gallons per minute, L = length in yards, d = diameter of outlet in inches. The head required to overcome friction in the pipes, taking different diameters separately in $H = \frac{G^2 L}{240d^5}$, the letters having the same

significance as before. In the case set by querist it must be presumed that the 40 lbs. pressure in the basement is what is left after allowing for all the losses named above, as a head of 30ft. would give a statical pressure of $300 \times 0.434 = 130.2$ lbs. per sq. in. Then the virtual head due to a statical pressure of 40 lbs. per sq. in. would be $40 \div 0.434 =$ say 92ft.; from this must be deducted 38ft., the height to which the outlet is carried, making an effective head of 54ft. available for calculation. Assume 20 gallons per minute on an outlet of $\frac{3}{4}$ in. diameter, then the head required to produce the requisite velocity for this would be $H = \frac{G^2}{215d^4} = \frac{20^2}{215 \times \frac{9}{16}} =$ say 30ft. The head to overcome friction in the $\frac{3}{4}$ in. pipe would be $H = \frac{G^2 L}{240d^5} = \frac{20^2 \times 12\frac{1}{2}}{240 \times \frac{243}{32}} =$ say 88ft.; making together $30 + 88 = 118$ ft. head required to pass 20 gallons per minute. There is, however, only 54ft. head available, so that the discharge will be reduced to

$20 \times \sqrt{\frac{54}{118}} = 20 \times .68 = 13.6$ gallons per minute. The section on hydraulics in the "Engineers' Handbook" (Spoon, 4s. 6d. nett), will be found useful in determining questions of this kind.

HENRY ADAMS.

Storm Overflow Weir.

THAME.—WEIR writes: "What type of storm overflow weir would you recommend on a 12in. sewer laid at a gradient of 1 in 23 (iron pipe) carrying a d.w.f. of about 6,800 gallons per twenty-four hours? Will you kindly show me how to calculate the width and height of a leap weir to carry away more than six times the above d.w.f.? I find (see Box's 'Hydraulics,' p. 65) that a weir similar to sketch would work out at 5ins. wide by 2 $\frac{1}{2}$ ins. deep. I do not like the idea of contracting a 12in. channel to 5ins.; the height also is too small in my opinion."

We do not like the type of weir shown, or in fact any type of weir in which the sewage has to flow through an orifice. A better type is the simple overflow—i.e., when the sewage has risen in the front sewer to a height equivalent to six times the dry weather flow, it is just level with the top of

NEW PUBLIC BATHS AT CAMBERWELL: FIRST-CLASS BATH, LOOKING TOWARDS DEEP END, ARRANGED FOR USE AS A HALL IN WINTER, WITH FLOOR AND PLATFORM. E. HARDING PAYNE, A.R.I.B.A., ARCHITECT.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendation as to consent or refusal being appended in *italics*:—

Buildings upon the site of Nos. 117 to 131 (inclusive), Stockwell Road, Brixton, on the application of P. Tree on behalf of Foster's Trustees. (*Consent.*)

Oriel windows and a projecting balcony at Nos. 2, 3 and 4, Cheapside, on the application of F. Rowntree, on behalf of The Scottish Temperance Life Assurance Co., Ltd. (*Consent.*)

A projecting balcony at No. 80, Portland Place, St. Marylebone, on the further application of Boehmer & Gibbs, on behalf of Matthews, Rogers & Co. (*Consent.*)

Residential flats, with bay windows, upon the site of Nos. 79 to 105 (odd numbers only) inclusive, Park Road, Regent's Park, on the further application of Sir Arthur Blomfield & Sons, on behalf of H. Johnson. (*Consent.*)

Buildings on the front portion of "The Nook" estate, to abut upon Tooting Bec Road, next Tooting Common, on the application of W. C. Poole, on behalf of Coates. (*Refusal.*)

An iron and glass shelter at the entrance to De Keyser's Royal Hotel, Victoria Embankment, City, on the application of J. W. Singer & Sons, on behalf of De Keyser's Royal Hotel, Ltd. (*Refusal.*)

A building on a site abutting upon Prah Road and St. Thomas Road, Finsbury Park, on the application of F. Matcham & Co. (*Refusal.*)

An addition at the western end of Christ Church, Christ Church Street, Chelsea, with external walls at less than the prescribed distance from the centre of the roadway of the street, on the application of E. Geldart, on behalf of the Rev. J. P. Thompson. (*Refusal.*)

A modification of the provisions of that section with regard to open spaces about buildings so far as relates to the proposed erection of Nos. 8, 9 and 10, Lower Marsh, Lambeth, with irregular open spaces at the rear, on the further application of W. H. Rogers. (*Consent.*)

A deviation from the drawings approved on April 17th, 1905, in respect of the means of escape in case of fire proposed to be provided in pursuance of section 63 of the London Building Act, 1894, on the fifth (top) storey of Nos. 118 to 122, Holborn, on the application of J. Sawyer, on behalf of A. W. Gamage, Ltd. (*Consent.*)

A sub-station on the southern side of Randolph Mews, Portsdown Road, Paddington, on the application of S. H. Highfield, on behalf of the Metropolitan Electric Supply Co., Ltd. (*Consent.*)

A new street for foot traffic only at the rear of houses on the east side of Godfrey Street, Woolwich, on the application of F. C. Hensley and S. A. Douglass. (*Refusal.*)

NEW BATHS AT CAMBERWELL.

THE new baths in Old Kent Road, London, S.E., have been designed by Mr. E. Harding Payne, A.R.I.B.A., of 11, John Street, W.C. (selected in competition), and comprise swimming, warm, douche, Turkish and Russian vapour baths and washhouses. The site is small. The principal feature of the plan is the first-class swimming bath, which had to be arranged in view of its

being used as a public hall in winter. The accompanying photograph shows it as such. The gallery seats are Nicholl's patent automatic rising seats, and the railing in front is of ornamental wrought-iron executed by Messrs. George Wragge, Ltd., who also supplied the railings in front of the building. The bath is lined throughout with ivory white glazed bricks with coloured bands and dadoes by the Leeds Fireclay Co., who have supplied all the glazed bricks used in the build-

ing. The gangway around the bath is laid with non-slipping tiles supplied by Messrs. G. Woolliscroft & Son, Ltd., with slate coping and terrazzo flooring in dressing-boxes. The bath is 75ft. by 30ft., and is lighted by twelve 5-light pendants and four arc lights. The floor is supported by deal trusses in the well of the bath. The second-class bath measures 75ft. by 29ft. The slipper baths are divided into three classes. They are each 6ft. square, and divided from one another by rin. slate divisions supplied by Messrs. Congdon & Powell, those in the first-class being enamelled and in the third-class plain slate oiled. The baths are of white enamelled fireclay supplied by the Leeds Fireclay Co., Ltd., and are enclosed with slate sides. The whole of the engineering work in connection with the baths was designed by Mr. W. M. Binny, A.M.I.C.E., of Teddington. The clock on the exterior (here shown) has been made by Messrs. Gillett & Johnston, of Croydon. The works are fixed inside the building, the movement being transferred through bevel gearing. The case was designed by the architect and is of oak. It is over 10ft. high, and the dials are 3ft. 6ins. in diameter, electrically illuminated.

QUEEN VICTORIA MEMORIAL STATUE, YORK. G. W. MILBURN, SCULPTOR.

This memorial was unveiled last week by Princess Henry of Battenberg. The figure is of white marble on a dark red base and is placed in the Guildhall. It is the work of Mr. G. W. Milburn, of York. The weight of the statue is between 3 and 4 tons, and the block is practically flawless.

ARCHITECTURAL REFINEMENTS.

MR. WILLIAM HENRY GOODYEAR, of the Brooklyn Institute of Sciences and Arts, last week delivered his second lecture in connection with the exhibition of photographs illustrative of architectural "refinements" present in Italian and French churches, at present being held at the Scottish National Portrait Gallery, Edinburgh. Continuing his description of the cathedral of Pisa, Mr. Goodyear said the folly of the argument that the builders of the Middle Ages were incapable of intentionally creating picturesque effects was demonstrated by an examination of various startling asymmetries in the cathedral. The columns of the nave, he pointed out, were of irregular size, because they were obtained from various ancient ruins in Sicily; but the arrangement of these columns was proved to be schematic, because they found that all the large columns were on the south side of the nave and all the small columns on the north side. The law of chances showed that such an arrangement must have been schematic. The average difference of height between the two ranges of columns was over $1\frac{1}{2}$ ft. This decentred the church optically and gave an agreeable effect of the quartering view when the church was studied from the exact centre. The arrangement also produced a confusion of optical effects resulting in a sort of optical vibration, or an effect of "life." In the same way the columns of the south transept were $2\frac{1}{2}$ ft. higher on the west side than they were on the east side. It was inconceivable that all the larger columns should have

been placed on one side of the transept by accident.

The levels of the great string-course which divides the lower storey of the cathedral on the exterior were described in detail. The levels had been taken for the pavement as well. To the east of the west sides of the transepts the cathedral was built to the earth's surface, so that the pavement was $4\frac{1}{2}$ ft. lower at the south-east angle of the choir than it was at the north-west angle of the façade. The cornice was carefully build to the same slope on the east of the west sides of the transepts, but on the west sides of the transepts and on the sides of the main body of the cathedral another system was found. Here, on both the north and south sides, the string-course sloped downward toward the transepts, being 2 ft. out of level as compared with the plinth-course and about the same amount as compared with the true level. On the other hand, the string-course on the west sides of the transepts sloped down to the angle of meeting with the north and south sides about $\frac{1}{2}$ ins. on each side, as compared with the plinth-course, and in a direction opposed to that of the slope of the plinth-course.

The lecturer pointed out that a confusion of optical effects rather than an effect confined to any one direction was the inevitable outcome of this arrangement, although it must also be admitted that a material increase of apparent dimension was also obtained for points of view facing eastward. As regards this optical confusion, he quoted Mr. Ruskin's self-confessed inability to determine whether there was any slope at all in

the string-course of the south wall, as mentioned by him in the Lamp of Life ("Seven Lamps of Architecture").

Referring to the tower, the lecturer described the observations of Ranieri Grassi, made in 1832, and the corroboration and extension of these observations by his own measurements in the spiral stairway. This stairway is built with varying heights according to its relation to the leaning side. The spiral changes are so arranged as to make the stairway lower on the upper side and higher on the lower side of the lean, thus throwing the greater weight of masonry on the upper side and so increasing the security of the construction. No possible theory of explanation for such a succession of changes in the heights of the spiral stairway could be advanced excepting the one that they were connected with the preconceived design of a leaning construction.

There was a special school of Pisan symmetry, and we needed to be careful not to argue the existence of the same sentiment in territories outside the Pisan influence.

OUR PLATES.

THE shops in a provincial town are intended to be constructed of Portland stone, and are estimated to cost £3,514. The woodwork will be of teak, the windows (excepting the shop front) being filled in with lead glazing, in teak wood and wrought-iron frames. The shop windows will be of plate-glass in teak-wood framing. The roof will be constructed of steel joists and concrete, and covered with Vulcanite. The floor will be similarly formed, and laid with wood blocks. Mr. T. Middleton Shallcross, of Liverpool, is the architect.—The house at Parkstone, overlooking Poole Harbour, is proposed to be carried out in brick, rough-cast, with the roof of Swanage stone slabs and the woodwork treated with Carbolineum or other staining and preserving mixture instead of paint. The house is to be built close up to the roadway which bounds the site on the east front, so that full advantage may be taken of the sloping and terraced gardens on the south and west sides.

Law Cases.

Right of Landlord to take away Tenant's Front Door.—At the Shoreditch County Court recently his Honour Judge Smyly, K.C., had to decide whether a landlord had the right to take away an obstinate tenant's front door. The case was *Aldridge v. Chastney*, and the facts were as follows:—The landlord had arranged with the tenant that the latter should quit the premises in question on June 24th last. The tenant, however, refused to quit. Thereupon, on July 3rd, the landlord's agent called upon the tenant to give up possession, which he refused to do. After some altercation the agent ordered his men to take away the front door of the premises, which was done. Upon this the tenant, in reply to a claim for rent, counterclaimed for damages for trespass and loss of goods stolen from his shop. Mr. Calvert, who appeared for the tenant, argued that this was a clear case of trespass. Mr. S. P. J. Merlin, counsel for the landlord, contended that a tenant was not entitled in law to bring an action of trespass under such circumstances. The landlord was the only person entitled to go on the premises after June 24th, and consequently he could do whatever he liked with the premises—take the roof off or take away the front door if he so chose—and the tenant, being nothing but a trespasser on the premises, had no right to maintain an action for trespass with regard to premises wherein he himself was a trespasser. After consideration of the authorities cited by counsel, the learned judge gave judgment for the landlord on both claim and counter-claim.

Coming Events.

Thursday, November 2.

CARPENTERS' COMPANY.—Dr. A. Wynter-Blyth on "The Sanitary Arrangements of Buildings, &c.—II." Carpenters' Hall, London Wall, at 7.30 p.m.
EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. Goodyear on "Architectural Refinements," at 8.30 p.m.
ARCHITECTURAL ASSOCIATION.—Conversazione.
THE CHEMICAL SOCIETY.—Ordinary Meeting at 8.30 p.m.

Friday, November 3.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. R. Park on "Underpinning," at 8 p.m.
JUNIOR INSTITUTION OF ENGINEERS.—Mr. Dugald Clerk on "The Problem of the Gas Turbine," at 8 p.m.

Monday, November 6.

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. A. Needham Wilson on "Sketch Plans and Working Drawings."
SOCIETY OF ENGINEERS.—Mr. Sherard Cowper-Coles, A.M.I.C.E., M.I.M.E., on "The Metallic Preservation and Ornamentation of Iron and Steel," at 7.30 p.m.

Monday, November 13.

SURVEYORS' INSTITUTION.—General Meeting at 8 p.m.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending October 27th twenty-four failures in the building and timber trades in England and Wales were gazetted.

F. PURSER, plumber, Leicester. Deficiency £266.
 EVANS & ROBERTS, builders and contractors, Brynamman. Adj. Oct. 19th.
 D. THOMAS & SON, builders and contractors, Cardiff. Deficiency £1,176.
 J. HARLEY & SON, builder, Smethwick. Deficiency £6,678.
 G. BROWN, builder and contractor, Great Witchingham. Deficiency £370.
 R. ALLEN, plumber, Leeds. P.E., Leeds C.C., Nov. 14th, at 11.
 A. L. GENLOND, architect, Cherryhinton. R.O. Oct. 21st.
 C. MITCHINSON, plumber, Bishop Auckland. Adj. Oct. 19th.
 J. A. CRAIG, builders' material merchant, Southend-on-Sea. P.E., Shirehall, Chelmsford, Nov. 1st, at 10.
 TIMSON & ADAMS, builders' merchants and contractors, Leicester. R.O. Oct. 21st.
 W. BRIGGS, plumber, Leeds. First meeting, O.R.'s, Leeds, Nov. 1st, at 12. P.E., Leeds C.C., Nov. 14th, at 11.
 T. ELLISON, builder, Gomersal. First meeting, O.R.'s, Dewsbury, Nov. 1st, at 11. P.E., Dewsbury C.C., Nov. 7th, at 2.
 W. C. BROADHURST, builder and contractor, Stockport. First meeting, O.R.'s, Stockport, Nov. 3rd, at 11. P.E., Stockport C.C., Nov. 8th, at 11.
 RAYNER & CO., tile and brick makers, Runwell and Galleywood Common. P.E., Shirehall, Chelmsford, Nov. 1st, at 10. First meeting, same, at 3.
 P. S. HOWARD, builder, Charlton. First meeting, 24, Railway Approach, London Bridge, S.E., Nov. 2nd, at 11.30. P.E., Greenwich C.C., Nov. 14th, at 1.
 C. C. CROWE & CO., timber and builders' material merchants, Tottenham and Kensal Rise. P.E., Edmonton C.C., Nov. 27th, at 11.30.
 G. W. GREGORY, builder, Sutton-in-Ashfield. First meeting, O.R.'s, Nottingham, Nov. 1st, at 12. P.E., Nottingham C.C., Nov. 3rd, at 10.
 M. MORLEY, architect and surveyor, Wellington. First meeting, Charlton Hotel, Wellington, Nov. 4th, at 12.30. P.E., Madeley C.C., Nov. 15th, at 11.30.
 H. OSWIN, builder, Walsall. First meeting, O.R.'s, Wolverhampton, Nov. 2nd, at 11.30. P.E., Walsall C.C., Nov. 29th, at 11.30.
 J. N. DAWSON, builder, Great Yarmouth. First meeting, O.R.'s, Norwich, Nov. 4th, at 12. P.E., Great Yarmouth Town Hall, Nov. 7th, at 11.
 J. HALLETT, builder, Sutton. First meeting, 24, Railway Approach, London Bridge, S.E., Nov. 1st, at 11.30. P.E., Croydon C.C., Dec. 7th, at 11.
 H. MARTER, builder, Kingston-on-Thames. First meeting, 24, Railway Approach, London Bridge, S.E., Nov. 3rd, at 12. P.E., Kingston C.C., Dec. 12th, at 2.30.
 HAND BROTHERS, plumbers and decorators, King's Norton. First meeting, 191, Corporation Street, Birmingham, Nov. 2nd, at 12. P.E., Birmingham C.C., Nov. 27th, at 2.
 G. YEOMANS, builder and contractor, Farnborough. First meeting, 24, Railway Approach, London Bridge, S.E., Nov. 3rd, at 12.30. P.E., Guilford Town Hall, Nov. 7th, at 1.

New Companies.

T. W. POUNDER AND SONS, LTD., plumbers, glaziers, &c., West Hartlepool. Capital: £4,000.
 BAILDON ESTATE AND QUARRY CO., LTD. Capital: £7,000.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

C Coventry.—Accepted for extensions at the infirmary, for the Guardians:—

A. A. Wincott £6,700

Halberton.—For taking down and rebuilding farmhouse at Halberton Court, Devon, for Mr. Robert Pearce Elworthy, Mr. William Barrons, architect, Deepway, Tiverton:—

Tucker, Parr & Pincott, Tiverton ... £1,651 0 0
 J. Grater & Sons, Tiverton ... 1,524 0 0
 R. Hill & Son, Cullompton ... 1,440 0 0
 R. Grater & Sons, Tiverton ... 1,438 0 0

Competitions Open.

THE BEDFORDSHIRE COUNTY COUNCIL invite Architects willing to compete in a limited COMPETITION for a new Secondary School and Technical Institution, proposed to be erected in Park Square, Luton, to submit their names to the undersigned before MONDAY, November 6th, 1905.

The Education Committee in whose hands the matter has been placed by the Council have appointed Mr. H. Percy Adams, F.R.I.B.A., to adjudicate upon the designs of the selected architects (probably seven), and the author of the design chosen by him will be employed to carry out the work and be paid in accordance with the schedule of charges sanctioned by the Royal Institute of British Architects.

To the unsuccessful selected architects an honorarium of £10 each will be paid provided they submit a bonâ fide competitive design.

The cost of the buildings is not to exceed the sum of £6,000.

W. W. MARKS,
Shire Hall, Bedford. Clerk of the County Council.

Contracts Open.

ESSEX EDUCATION COMMITTEE.

BRAINTREE ADVISORY SUB-COMMITTEE.

TO BUILDERS AND JOINERS.

The above Committee invite TENDERS for the ERECTION of a CLOSE JARRAH WOOD FENCE (about 138 yds.) at Braintree.

A plan of the site to be fenced may be seen at, and a copy of the specification obtained from, the office of the undersigned.

Sealed Tenders, endorsed "Jarrah Wood Fence," must reach me not later than WEDNESDAY, 8th NOVEMBER, 1905.

The Committee do not bind themselves to accept the lowest or any Tender.

JOHN GLEAVE,
Clerk to the Braintree Advisory Sub-Committee.
Hollywood,
Braintree,
21st October, 1905.

GLOUCESTER EDUCATION COMMITTEE.

TO BUILDERS AND CONTRACTORS.

Builders desirous of TENDERING for the ERECTION of COUNCIL SCHOOLS in Derby Road, Gloucester, are requested to send their names to the Architect, Mr. J. Fletcher Trew, M.S.A., County Chambers, Station Road, Gloucester, not later than the 1st NOVEMBER next, between the hours of Ten and Five, at whose office the plans and specifications may be seen.

Bills of quantities may be obtained from Messrs. Vale & Kingsford, George Street, Gloucester, on deposit of £5 note, which will be returned on receipt of a bonâ fide Tender with the return of all papers supplied.

Sealed Tenders are to be sent in to the undersigned not later than NOON on TUESDAY, NOVEMBER the 21st next, endorsed "Tender for Derby Road Council Schools, Gloucester."

The Committee do not bind themselves to accept the lowest or any Tender.

P. BARRETT COOKE,
5, Berkeley Street, Gloucester. Secretary,
City of Gloucester Education Committee.

If
you
have
anything
to sell

or if you want to buy anything, if you require a situation, or if you have a berth vacant, the best medium for advertising your want is THE BUILDERS' JOURNAL. Advertisers in our Miscellaneous Columns obtain most satisfactory results, and we frequently receive letters stating that an advertisement in the Journal brings immediate replies.

"A first rate medium for Situations wanted. I have received several answers to my advertisement," writes an advertiser who obtained a situation after inserting an advertisement in our columns. This is only a sample of what we are constantly hearing. Write your advertisement clearly and send it to the Manager, Builders' Journal, Great New St., Fetter Lane, E.C.

It
will
bring
you
results.

The Three Builders' Journal Insurance Schemes are—

- (1) A Free Accident Insurance of £500.
- (2) An Accident Insurance of £500.

And also

£250 for Permanent Total Disablement.
£2 10s. per week for Temporary Total Disablement.

Premium, 1/-

(For the conditions under which policies Nos. 1 and 2 are issued readers should refer to our pamphlet, sent on application.)

- (3) An Accident Insurance of £1,000,
£500 for Permanent Total Disablement,
£6 per week for Temporary Total Disablement,
with special advantages.

THE
BUILDERS' JOURNAL
AND ARCHITECTURAL RECORD.

November 8, 1905. Vol. 22, No. 561.

6, Great New Street, Fetter Lane, E.C.

Summary.

In his presidential address to the Institute on Monday night Mr. Belcher said the council, after many enquiries, were now prepared to recommend the acquisition of a fine freehold site in Portland Place for a new official home of the Institute. With regard to registration he said that the committee appointed by the general body had suggested a form of Bill, but as considerable diversity of opinion still existed it was scarcely possible that the Bill would pass into law. On the question of education and the new board he announced that some twelve well-known architects had intimated that they were now willing to join the Institute and work with it. (Pages 272 and 273.)

The Gladstone Memorial in the Strand was unveiled on Saturday. (Page 270.)

The City Corporation decided last Thursday to promote a Bill in Parliament for widening Blackfriars Bridge and to construct a subway for foot passengers under the roadway at the northern end. (Page 270.)

Messrs. Spencer, Santo & Co., Ltd., declare an interim dividend of 8 per cent. per annum on their ordinary shares. (Page 270.)

Within the past few years New York has been building a number of public baths, the plan adopted being a combination of shower baths and a swimming bath. It is an essential part of the scheme that bathers shall use the former before going into the latter. (Page 263.)

As a solution of the difficulty of future interments in Westminster Abbey Mr. Bodley suggests that the space in Dean's Yard should be treated after the manner of the "Campo Santo" at Pisa. (Page 270.)

The London wood market may be said to have improved all round during October, though the volume of demand was not all that could be wished. The import of teak continues to be small, and it is matter for consideration that Java wood constituted one-half of the import last month—wood from a Dutch possession thus taking the place of Indian teak. The Liverpool market is in a fairly active condition. (Pages 268 and 269.)

An amusing case concerning a pupil articled to a Bradford architect was heard last week. For the pupil it was contended that he was not being taught the details of his profession, while the architect counter-claimed for damage done to office furniture, and misdemeanour. (Page 271.)

In a case concerning the employment of day labourers heard at Manchester last week the stipendiary gave a verdict in their favour on the ground that, as they were told to "stand down" and afterwards kept waiting, they had a right to be paid their wages at once, or be compensated for the time they were kept waiting. (Page 271.)

A "little palace" has been discovered at Knossos, and a new type of column with fluting in relief has been found there. (Page 274.)

Two more Unsatisfactory Competitions.

OUR leader in last week's issue on the subject of competitions has excited considerable interest. We are proceeding with our arrangements for obtaining early and full information regarding competitions, and shall be glad if readers will forward any news that reaches them, so as to assist in remedying abuses to which we have called attention, abuses which are a blot upon architectural practice. We pointed out how the press and the architectural public are advisedly kept ignorant by the promoters of these doubtful competitions. No opportunity is given to get at the facts. We have just found another instance, namely, that of the Elgin cemetery extensions competition. Upon applying for a copy of the conditions and the names of the winners, and as to whether the designs would be on exhibition, so that we might have the opportunity of criticizing them, we received a reply from the solicitors to the committee stating that the prize has been awarded to a local architect, Mr. William C. Reid, and that his design was under consideration with a view to alterations; and the significant remark was added that they did not think that the committee would care to have it criticized. The conditions have not been furnished to us, nor is there any statement that any public exhibition of the designs was held. We must point out to the promoters that their action leaves them open to the gravest suspicion, because other competitions have been unfairly promoted, the work being handed over to a local architect friendly with the promoters and his design modified in accordance with the suggestions obtained from the designs submitted by other competitors, these ideas being filched without any remuneration. We cannot say whether this is the case in the Elgin competition, because no opportunity is afforded to come to a judgment upon the merits of the case, nor is any information vouchsafed as to the conduct of this competition. No assessor appears to have been appointed; where a professional assessor is engaged competitors have the satisfaction of knowing that their designs have been judged by a person qualified to do so. Another unsatisfactory instance comes from Dartmouth. The "Exeter Flying Post" states that over forty plans have been sent in for the new municipal buildings, and these the committee have reduced to three. Our contemporary sagaciously remarks: "How many of the committee are competent to judge which comes within the mark of £7,000? There are on the council a coal merchant, two outfitters, a tailor, a retired draper, a publican, a sailmaker, a builder, a farmer, two shoemakers, an engineer and a butcher.

It cannot be expected that, with two exceptions, they have any knowledge enabling them to decide which plan would be the best and cheapest for the town." This is typical of the unfair conduct of many competitions. We trust that the local press and other guardians of the public honour, however, will see that any moral injustice is brought home to those responsible.

Overloading of Floors.

THE sad fatality that occurred at Burslem last week, when a girl was killed by the collapse of a warehouse floor, comes as another warning against the dangerous and ignorant practice of loading floors without any investigation or understanding of their strength. Buildings are often used for purposes for which they were never designed, and are loaded with heavy weights without anyone consulting an architect or engineer as to the safety of doing so. Public officials ought to attend to this matter, but they do not, and, as a consequence, accidents frequently occur. This particular one occurred at the factory of the Rhodes Tile Co., Ltd., in Reginald Street, Burslem. The building was of two floors, the upper floor being used for storing tiles, and the lower, or ground floor, as a workshop, about a dozen persons being there engaged. A considerable weight of tiles was stored on the first floor, and one of the walls of the premises had recently shown signs of bulging and was strengthened by an iron rod bolted on a stout beam. Without any warning the upper floor collapsed and crashed into the shop below, killing one girl and severely injuring another, and also slightly injuring a man. The warning which was given by the bulging of the wall should have been attended to. The strengthening by means of the bolt was evidently insufficient, and those responsible should have known that this method was inadequate. We have noticed on many occasions how floors are similarly overloaded in buildings used as factories or warehouses. Printers in particular are careless in regard to this matter. It is true the buildings in which they work have generally been designed as warehouses, but seldom were they intended for printing works, and the heavy distributed and the very great concentrated loads were unrealized by their designers. We have often seen type piled up to a great height on floors and staircases. It is lucky that there is a large factor of safety, for if it were not for this there would be accidents. The absolute ignorance displayed in this respect is remarkable, and as the owners and workpeople seem unable to take care of themselves it should be the duty of public officials to see that no danger arises.

CURVES IN CLASSIC ARCHITECTURE.

Not Optical Refinements.

IN his third lecture on architectural refinements, at Edinburgh, Mr. W. H. Good-year dealt with the refinements present in the buildings of Classic Greece. He said that the popular explanation that the Greek curves in elevation were intended to correct a sagging effect in a long horizontal line had no authority to support it, although it appeared to be making its way into popular compendiums. Penrose never suggested such an explanation, nor had it been suggested by any other standard authority. Neither Hoffer, Thiersch, Hauck, Burckhardt, Kugler, Schnaase, Boutmy nor Burnouf ever suggested such an explanation. Experts in curvilinear perspective asserted an exactly contrary appearance. A horizontal line curved optically upward when seen above the level of the eye. It curved optically downward only when seen below the level of the eye. What Penrose suggested was an entirely different matter, namely, that there was a sagging effect of a horizontal line under a gable. This was true, but it did not account for the curves on the flanks. Therefore the explanation of Penrose had been universally rejected or ignored by Continental authorities. Thiersch and Hauck had also shown that the explanation of Penrose did not even meet the problem of the curve in the stylobate under the gable. The stylobate was supposed by Penrose to have been curved to harmonize with the entablature, but as long as the curve of the entablature under the gable was conceived by Penrose as simply correcting an optical sagging, the entablature would, on this theory, appear straight, and consequently there would be no occasion to curve the stylobate for reasons of harmony.

Mr. Goodyear next pointed out that the theories of optical correction which had been advanced by Thiersch and Hauck (which he explained in detail) were undoubtedly advanced on the theory of Penrose, but as they were formulated in ignorance of the curves in plan in the temple of Medinet Habou they were discounted by this very simple circumstance. The existence of these Egyptian curves was not made known to the world until 1878, although they were discovered by Pennethorne in 1832, in advance of his discoveries of the curves of the Parthenon.

The only optical expert who had published on the curve since 1878 was Guido Hauck. His work appeared in 1879, and he was not aware of Pennethorne's publication of the previous year.

Thus Mr. Goodyear explained that the theories of optical correction for the Greek curves must be considered as out of date. They had never figured in the publications of the great German authorities on the history of art, such as Burckhardt, Kugler and Schnaase. These authors had considered the sentiment of beauty a sufficient explanation, and as Penrose himself had mentioned "the beauty inherent in a curved line" as a concurrent explanation for the curves on the flanks it might be safely accepted as a theory satisfactory to all parties. The theory that the Greek curves were intended to build in effects of curvilinear perspective, in harmony with and accenting the rising curves which all horizontal lines above the level of the eye optically presented under normal circumstances, was not to be neglected. This theory was advanced by Hoffer in 1838, and his publication long preceded that of Penrose in 1851. But Hoffer again insisted on the sentiment of beauty as a concurrent cause. In 1870 Boutmy again developed the perspective theory, but once more accentuated the sentiment of beauty. The Egyptian curves in plan might come under both explanations. No one except the editor of the "Builder" had

ever suggested that they were optical corrections.

The curves in plan on the flanks of the temple of Neptune at Paestum were announced by Jacob Burckhardt. The curves in plan of the Maison Carrée at Nîmes were announced by the lecturer in 1895. These curves could not be brought under any theory of optical correction that had ever been advanced by a standard authority on optics.

The general argument of the lecture was, therefore, that the contention that the Greek curves were solely optical corrections had no standing; consequently, the contention that the mediæval curves could be derived from classic because they were not optical corrections had no standing either.

The Curves of Italy.

In his fourth lecture Mr. Goodyear began by comparing dates for the known architectural curves of antiquity. There was, he said, a gap of 700 years between the curves of Medinet Habou and those of Paestum, but we did not on that account hesitate to derive the Greek curves from the Egyptian. There was a gap of 700 years between the curves of the Maison Carrée and those of the Parthenon, but we did not on that account hesitate to derive the Roman curves from the Greek. We knew that the intervening monuments had disappeared, and were certain that many of them would furnish connecting links if all were still in existence. There was a gap of 400 years between the curves of the Maison Carrée and those of the sixth century as found in St. Sophia, at Constantinople, and in S. Apollinare Nuovo at Ravenna. This gap was less than those which intervened between the curves of the ancient monuments.

Mr. Goodyear then described the curves in plan of S. Apollinare Nuovo at Ravenna; of the cloister of the Celestines at Bologna (twelfth century), in which the curves rise from the foundations and are convex to the centre of the court on all sides, with a deflection of 5 ins. in 50 ft. at the second storey; of the cloister of S. Zeno at Verona; the curves in plan and curves in elevation of Pisa Cathedral; and finally the curve in plan of St. Mark's façade and the curves in elevation in the gallery parapets of the interior.

Reference was then made to the certificate attesting the constructive existence of these last curves which had been furnished by Commendatore Pietro Saccardo, who for seventeen years was director of the repairs of St. Mark's and forty years connected with the administration of the repairs.

THE DEVELOPMENT OF ENGLISH HOUSE BUILDING.

AT the last meeting of the Sheffield Society of Architects and Surveyors Mr. W. J. Hale gave a lecture on English architecture of the sixteenth century—from 1550 to 1600. The buildings of this period, he said, showed the struggle between the older Gothic forms and the newer classical ones imported from abroad. At first many buildings presented combinations of the styles, and even at the end of the sixteenth century the Gothic spirit had not been completely vanquished. Speaking broadly, the artistic struggle was between the horizontal and the vertical lines, between symmetry and balance on the one hand and irregularity and picturesqueness on the other. One of the features of the time was the practical cessation of church building, due no doubt to the suppression of the monasteries and the change in the religious thought of the people. Another feature was the increase of house building, especially that of large houses for the nobility and leaders of the land, due to the greater desire for display, and in a measure to the rise of a different class to positions of wealth and influence. The old

simple arrangement of a large common hall, with a portion cut off by screens to serve as a passage to the kitchen quarters, was found inconvenient, and as the plan was developed to meet new needs it affected in its turn the general elevations of the building. Prominent features such as doorways, fireplaces, &c., were first affected by the new ideas, whilst the general composition preserved the old spirit. On the other hand, the mullioned window held its own, and, indeed, grew both in width and height, so as to become one of the striking features of the period. The Gothic string-course was expanded into a small cornice, and jamb mouldings previously worked into the wall stones were succeeded by projecting architraves. Generally speaking, a greater air of finish and comfort, the latter perhaps only superficial, was imparted to the buildings, and served in a measure to distinguish them from those of the earlier Gothic periods.

PROF. BERESFORD PITE ON TRAFALGAR SQUARE.

THE Nelson Centenary has served to revive again the projects for the improvement of Trafalgar Square. In reference to this matter Prof. Beresford Pite writes an interesting letter to the "Times," in which he says:—

"Trafalgar Square, as a whole, with its magnificent northern wall, pedestals, fine sweeping steps and descending parapets, completed by granite lamp piers, has a grandeur and consistency of design that we should not be now likely to equal or improve upon if we were to set about a similar task; the fountains and their pools and the pavements accord with the scale of the whole, and the broad paved surface has other values than those of facility of locomotion or of public meeting. The northern buildings of the National Gallery and St. Martin's Church spread and group not unsatisfactorily, while the proportions of the east and west façades are harmonious. I would protest against any distraction of the general breadth of effect by patches of grass or greenery, which would have no harmonious blending with trees or landscape, and also against any meddling by sculptured panels with the stern strength of the granite parapets. Whether or not the water display of the fountains could be varied and improved with practicable regard to the comfort of passers-by on a windy day I cannot say; but the experience gained with Mr. Gilbert's artistic use of water jets and sheets at the Shaftesbury memorial fountain in Piccadilly Circus is not encouraging, as they have nearly all suspended operations since the opening day.

"It is true that the National Gallery façade has been a byword among the picturesque enthusiasts of the Gothic Revival, but their point of view is now a thing of the past, and modern architects could be effectively challenged, by the ghost of Wilkins, its designer, to produce an equally satisfactory elevation with the limited means at his disposal.

The "Exaggerated Candlestick."

"If improvement is desired in commemoration of the Nelson Centenary, it might well be concerned with the detached monuments of the square and with the principal of them, namely, that to Nelson himself. Supposing that it is not possible to leave it alone (I could wish that it were for history's sake alone), nothing better could be done than to take it down and erect a better memorial in its place. The huge monumental Corinthian column is in itself an absurdity of proportion which destroys the success and the scale of the whole square. Its immoderate height and isolated position dwarf all attempts at decoration, and interfere with all central views of or from the buildings of the National Gallery. Our

FREE PUBLIC BATHS FOR THE CITY OF NEW YORK:
FRONT ELEVATION.WILLIAM MARTIN AIKEN AND ARNOLD W. BRÜNNER
ARCHITECTS.

sense of unsatisfactoriness in the front of this building is due to the persistent way in which the column fills the eye and mars architectural effect, reducing its portico and the not ungraceful dome above to meanness. No one pretends that the column is itself beautiful; it is too suggestive of an exaggerated, old-fashioned candlestick to be pleasant, and it dwarfs rather than magnifies the statue upon its summit. Our hero is put completely out of the reach of affectionate glances in passing and repassing, and we have to be content with seeing Sir Edwin Landseer's damp-looking mammoth lions, which again illustrate, on another scale, the difficulties of proportioning anything to such a column. The column and its appendages are really unworthy monuments of art. The sentiments of overwhelming gratitude for national services should be better expressed in a monument on a juster scale, and Trafalgar Square released from an incubus on its architectural effect which I have no doubt that all are indefinitely conscious of.

"If a beautiful and satisfactory monument cannot be provided now to Nelson, it will be preferable to leave things just as they are and seek some utilitarian outlet for our enthusiasm. . . ."

AMERICAN BATHS.

WITHIN the past few years the city of New York has been building a number of public bath-houses and has generally adopted the plan of overhead shower-baths. The double compartments, one used as a dressing-room and the other containing the shower (placed at an angle), is now an accepted type.

On this page we illustrate some new public baths to be built in Avenue A, 23rd and 24th Streets, to replace the floating baths in the East and North Rivers, which were discontinued on account of the contamination of the water by sewage. The plan will be studied with interest by English architects. It is a combination of shower baths and swimming baths. The arrangement provides for seventy-five showers for men and forty-two for women, it being an essential part of the scheme that every bather must first use the shower bath before being admitted to the plunge.

The swimming baths vary in depth from 3ft. 6ins. to 6ft. Around the edge is an overflow trough, for taking away any impurities that may form on the surface of the

water, and at one end of the main bath is a gallery for visitors, reached by a separate entrance from the outside. The roofs of all compartments are supported by iron trusses, each having a skylight in the centre. The extreme width of the building is 163ft. and the extreme depth 140ft. There are two large waiting-rooms, one for men and the other for women, each 25ft. by 50ft. The men's plunge is 42ft. by 66ft.; the women's plunge 25ft. by 49ft.

In planning these baths the main thought has been to facilitate the administration and to expedite the handling of the crowds of bathers. To this end the entrances and exits for men and women have been provided separately, so that those leaving the bath-

house do not meet the others waiting for admission.

The interior will be finished with enamelled brick walls, marble partitions between the shower-baths, and terrazzo floors, with a minimum amount of wood. The walls of the swimming baths are to be lined with heavy plates of opaque glass, and the corners rounded. The exterior of the building is to be constructed of Harvard brick, relieved with trimmings of Indiana limestone below and terra-cotta above the cornice line. On account of the nature of the soil it is to be built on piles; and as coal cellars are inadvisable, overhead storage rooms for coal are provided, the fuel being brought to the boiler-room by gravity.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication. Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Cleansing an Oven.

COUNTENANCE writes: "Which is the best way to make an ordinary kitchen oven clear of smoke when cooking? The oven in question has been neglected and grease and fat have contaminated the shelves and sides. Washing with soda and scraping has very little effect."

I am told that burning charcoal in the oven will cleanse it, but I do not myself think there is any better way than you have already adopted—continual scraping

F. S. I.

Aggregate Width for Exits.

BRISTOL.—YOUNG ARCHITECT writes: "A short time ago an urban council refused to pass plans of mine for a small chapel, on the ground that the aggregate width of external doorways was insufficient, and the council informed me that the width must be increased to 1ft. per twenty persons. I notice, however, by your issue of October 18th that the aggregate width of external doors in the new City Hall at Edinburgh is given as 1ft. per forty-four persons. This leads one to think that the council exceeded their rights in demanding the alteration stated, especially as they have no stipulations as to exits in their by-laws."

Does not the explanation of the apparently varying standards mentioned lie in the fact that the Edinburgh City Hall is very much larger than the chapel you cite? The correct area of exit for 1,000 persons can hardly be reckoned at the same ratio as that for 100 only.

F. S. I.

Dots over Figures in Quantities.

BRISTOL.—W. J. P. T. writes: "Please explain the following question, set at a recent examination: 'Work out the following dimensions, showing in detail the method adopted:—

$$\begin{array}{r|l} 2/14 & 12.6 \\ \text{cube } 2 & '9 \\ & '24 \end{array}$$

I have looked carefully through Leaning, Fletcher and other text-books, and can find no reference to the dot over a figure as used above."

In writing dimensions the "dotting-on" of a figure in the "timesing" is equivalent to a plus sign. Thus in the example given the result is $14 + 2 \times 2 = 32$ times the dimension. Had it been written $2^{1/14}$ the result would have been $2 + 14 \times 2 = 56$ times.

W. E. D.

Value of Constants in Formulae.

WATFORD.—FERRUM writes: "What variations are made in the following formulae when steel is used in place of wrought-iron? The text-books do not make this clear. Gordon's formula for struts and pillars,

$$B.W. = \frac{16}{1 + \frac{l^2}{ad^3}}$$

$$B.W. = \frac{cad}{L} \quad (c = 7 \text{ for B.W. in centre})."$$

The constant (f) in Gordon's formula, $P.W. = \frac{fs}{1 + \frac{ad^2}{l^2}}$, corresponding with 16 for

ROOF OF SMALL HALL.

wrought-iron, would be 24 for mild steel and 36 for cast-iron. The constant (c) in the formula for rolled joists, $B.W. = \frac{cad}{L}$, corresponding with 7 for single wrought-iron joists, would be 6 for compound girders of wrought-iron, 10 for rolled steel joists, and 9 for compound girders of rolled steel, all having their top and bottom flanges equal.

HENRY ADAMS.

Roof of Small Hall.

GLASGOW. — ARCHITECT'S ASSISTANT writes: "Do you consider that the accompanying section of a small hall is good construction and safe to be erected; if not, what is required to make it so? The walls are of brick, hollow, gins. on the outside and 4 1/2 ins. on the inside, with a 4 1/2 in. space between, except directly under the main trusses, where the walls are 18 ins. square, solid. The main trusses are 11 ft. apart and the hall is 24 ft. wide."

Your truss is badly designed, as the purlins do not come over the struts, and therefore cause unnecessary cross strain on the principal rafters. Fig. 1 shows a more satisfactory truss, which only decreases the headroom in the centre by about 18 ins. Fig. 2 is the frame diagram for Fig. 1, the maximum

stresses being marked on the various members, and Fig. 3 is the stress diagram. The scantlings have been calculated from these stresses, and are marked on Fig. 1. With regard to the hollow walls, it is usual to have 4 1/2 in. cavity spaces, the more common arrangement being a 2 in. continuous cavity with a 4 1/2 in. wall on the outside and a 9 in. wall inside. Where the trusses come, a half-brick pier is often built on the inside.

HENRY ADAMS.

Provisional Amounts and a Deed of Assignment.

SHREWSBURY.—G. D. L. writes: "The contractor of a building nearly completed has made a deed of assignment of his estate. I have received notice from his trustees claiming any balance that may be found owing in respect of the contract. In the bills of quantities there are several provisional amounts to be expended at my discretion and under my supervision. For some of these items I personally gave the orders, and practically assured the various tradespeople supplying the goods that I would keep sufficient money in hand on the contract to ensure their payment. The form of contract used was the printed one issued by the R.I.B.A., where the quantities do not form part of the contract. The trustees under the

deed of assignment maintain that these firms must be considered as creditors of the estate, and they claim the amount due to them as part of the assets of the estate. I on the other hand claim that under the contract I have full power to deal with these provisional amounts, in spite of the builder's deed of assignment. Would I be right, therefore, in issuing certificates for the p.c. amounts to be paid direct by my clients to the various tradespeople, deducting the amount from the contract and handing the balance to the trustees? If not, have the tradespeople any claim upon me for giving them the order, although they delivered the goods direct to the contractor?"

I am of opinion that the trustee under the assignment is right. (1) The tradespeople are not parties to your building contract, and they are in no better position than are other creditors of the bankrupt. (2) Therefore I do not think you can pay these sums in full and deduct from the balance of contract sum which is still owing. (3) The tradespeople have no claim against you personally, if you made it clear to them that you were selecting goods as architect only and not purchasing upon your own account. (See case in King's Bench Division, December 11th, 1902—*Gardner v. Wimperis and Arber*. F. S. I.

Strength of Rolled Joist.

PETERBOROUGH.—H. J. W. writes: "Please calculate the load that may safely be uniformly distributed upon a rolled steel joist 16 ins. by 5 ins., having flanges averaging 1 in. thick, with a span of 20 ft."

The effect of the load upon a beam is measured by the bending moment, and the strength of the beam is measured by the moment of resistance. These are always equal, or Effort = Resistance. Let M = bending moment in ton-inches; R = moment of resistance in ton-inches; w = distributed load in tons; l = span in inches; I = moment of inertia in inch-units in plane of bending; y = distance in inches from neutral axis to furthest edge of section; c = modulus of rupture in tons per square inch, commonly called extreme fibre stress, say 8 for mild steel; z = modulus of section, or value due to shape and size of section = $\frac{I}{y}$. Then $M = R$,

and $\frac{wL}{8} = zc$, where $w = \frac{8zc}{l}$. The moment of inertia may be found graphically, or may be calculated from the dimensions. The true section is as Fig. 1, but it may be

assumed as Fig. 2; then the area is given by the formula $A = bd - h(b - t) = (5 \times 16) - 14(5 - \frac{1}{2}) = 80 - 63 = 17$ sq. ins., the moment of inertia $I = \frac{bd^3 - h^3(b - t)}{12} = \frac{5 \times 16^3 - 14^3(5 - \frac{1}{2})}{12} = \frac{20480 - 12348}{12} = 677.6$, and the modulus of section

$$z = \frac{I}{y} = \frac{bd^3 - h^3(b - t)}{6d} = \frac{5 \times 16^3 - 14^3(5 - \frac{1}{2})}{6 \times 16} = \frac{8132}{96} = 84.7. \text{ Then } w = \frac{8zc}{l} = \frac{8 \times 84.7 \times 8}{20 \times 12} = 22.6 \text{ tons.}$$

It should be noted that the ordinary section of this size rolled steel joist is 15 x 5 x 50 lbs. with an average thickness of flange of $\frac{3}{8}$ in. and a web $\frac{1}{4}$ in. thick, carrying 18 tons over a span of 20 ft., with $A = 14.7$, $I = 556.5$ and $z = 69.6$.

HENRY ADAMS.

Fireproofing Wood.

MORPETH.—L. A. L. writes: "Please name some paint or solution for woodwork which will render it fireproof as far as possible, or even allow the wood to smoulder only."

Coating wood with a paint or solution to retard the burning is of very little use. The wood should be impregnated, and we advise you to purchase wood rendered fire-resisting, or else to protect the woodwork with a ceiling of pumice or porous tile slabs, slag-wool pugging or cement plastering on expanded metal.

PAINTS AND PAINT-WORK.—VI.

(Continued from p. 154, No. 553.)

VEHICLES.—III. Turpentine Substitutes and Adulterants.

FROM time to time many substitutes for turpentine have been placed upon the market under all sorts of fancy names. Some of these are good and may be used with advantage, being fully equal, if not superior, to the ordinary commercial turpentine. The majority of them, however, are inferior, and care should be taken to thoroughly test any substitute which is used. The substances used in the making of substitutes are cheaper vehicles, and they are also found used as adulterants of turpentine. These substitutes are usually resin spirit, benzene, and shale and coal-tar naphthas.

The first mentioned—namely, resin spirit—is a very good substitute or adulterant; in fact, there can be little objection to its use. It is obtained in the distillation of turpentine from the crude resin, and consists of a volatile liquid, water-white or tending towards a brown colour according to the degree of purification. Its specific gravity is about .88; it is thus heavier than turpentine. It has a low flashpoint, just above the ordinary summer atmospheric temperature, and it dries in the air by partly volatilizing and partly oxidizing, just in the same way that turpentine does, except that the resinous remainder after oxidization is not so much as with turpentine; consequently it is weaker. The addition of resin in solution raises this, however. In our last article we referred to the importance of this residue, because upon it depends to a great extent the value of turpentine, this acting as a binder for the pigment. The smell of resin spirit is not nearly so pleasant as turpentine, and in this way it can be detected, though this is often somewhat difficult. The danger with resin spirit is that it may contain traces of resin oil, due to want of care in the refining, and this prevents proper drying. Resin spirit enters into a large number of substitutes for turpentine, and is largely used for making cheap varnishes with resin. When used for turpentine substitutes the resin spirit is very often mixed with shale naphtha or benzene, which we will now refer to.

Benzene is obtained from the distillation of petroleum, and is also known as benzoline and petroleum spirit. The character of the liquid is well known. Its specific gravity ranges from .73 to .76. It has a low flashpoint, flashing at the ordinary atmospheric temperature. This is one of the largest sub-

stitutes for turpentine, and is serviceable when it is pure, but unless the distillation has been very carefully attended to it is liable to the danger of contamination by paraffins. Large quantities of benzene are used for driers. Some varieties on the market used for turpentine substitutes are rather heavier than pure benzene, and as they are not quite so inflammable they have been thought to be better than pure benzene; but as this heaviness is produced by the amount of petroleum and paraffin products in solution they are inferior to benzene. Very few of the petroleum products are free from paraffin wax or the non-volatile members of the paraffin series, or other non-volatile substances, and it is because of these that paints made with benzene have a tendency to peel. The reason is that when the paints dry the volatile portion of the benzene (or other petroleum product) passes away, the non-volatile portion remaining to be soaked up by the wood. This soaking up of an oily and slippery substance like paraffin wax into the wood prevents the paint layer from adhering to the surface of the wood. Whereas the non-volatile part of turpentine is very adhesive and helps to bind the paint to the surface, the non-volatile part of petroleum products fills the pores of wood, and this prevents paint from adhering or causes it to peel and scale off more rapidly than it naturally has a tendency to do.

Shale naphtha is obtained from the distillation of the shale found in Scotland between Glasgow and Edinburgh. It has a specific gravity of .73 to .76, and it flashes at ordinary temperatures. It consists chemically of a mixture of hydro-carbons belonging to the paraffin and olefine series, and the remarks made above with reference to benzene apply equally to this substitute. Coal-tar naphtha is obtained in the distillation of coal-tar. It has a specific gravity varying between .86 and .87, and is of a water-white colour. This also has a very low flashpoint, below the ordinary atmospheric temperature. It is used considerably for making quick-drying varnishes with resin. This is also liable to deleterious impurities. It has a distinctive smell which shale naphtha and benzene have not, smelling strongly of coal-tar.

It will be noticed that the benzene and naphtha substitutes and adulterants of turpentine all have low flashpoints, and thus they are dangerous in use, a point which cannot be overlooked in practice as paint-work has of course to be done in the interior of buildings. The objection most strongly applies, however, to painters' shops.

The conclusions we may come to from the above is that substitutes for turpentine may be very useful and unobjectionable if the substances composing them are very pure and do not contain non-volatile matters, which would fill the pores of the wood and so cause the paints to scale. Their effect upon the scaling of paints is not very apparent at once in use, requiring some time to develop. The architect needs to take particular care to see that the substitutes and adulterants of turpentine are trustworthy, either by specifying carefully in regard to the matter and testing what the painter is using or the paint materials that come from the manufacturer, or else to see that the work is given into the hands of a firm that knows its business and may be depended upon to give good work. One point in regard to benzene and naphtha substitutes for turpentine is notable, namely, that they do not leave a residue of resinous matter such as turpentine or resin spirit do, and that paints made with them do not dry with such a gloss as with turpentine. Means are taken in some of the substitutes to repair this deficiency by adding resin.

(To be continued.)

A COTTAGE FOR
A GAMEKEEPER
DEVAUDEN
A. JESSOP HARDWICK
F.R.I.B.A. ARCHT

The above cottage at Devauden, near Chepstow, has recently been erected of local stone, rough-cast, with tiled roof. Most of the external woodwork is oak, left natural. The gutters and down pipes are painted black. The architect was Mr. A. Jessop Hardwick, F.R.I.B.A., of Kingston-on-Thames, and the builders were Messrs. E. Turner & Sons, of Cardiff.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics* :—

Buildings on a site on the north side of Manor Road, Stoke Newington, between Nos. 4 and the Great Eastern Railway, on the application of Turner & Holditch, on behalf of F. Matthews. (*Consent.*)

One-storey shops at Nos. 164 to 172 (even numbers only) inclusive, Earl's Court Road, Kensington, to abut also upon Penywern Road, on the application of W. G. Hunt, on behalf of Jones Brothers. (*Consent.*)

One-storey shops in front of Nos. 435 and 437, Edgware Road, Paddington, on the application of Gardiner and Theobald, on behalf of Meux's Brewery Co., Ltd. (*Consent.*)

One-storey shops in front of Nos. 431 and 433, Edgware Road, Paddington, on the application of Gardiner & Theobald, on behalf of Matthews & Son, Ltd. (*Consent.*)

One-storey shops in front of Nos. 439 to 451 (odd numbers only), Edgware Road, Paddington, to abut also upon Maida Hill West, on the application of Boehmer & Gibbs, on behalf of W. Hirsch. (*Consent.*)

Residential flats, with bay windows, upon the site of Nos. 79 to 105 (odd numbers only) inclusive, Park Road, Regent's Park, on the application of Sir Arthur Blomfield & Sons, on behalf of H. Johnson. (*Consent.*)

One-storey shops on part of the forecourts of Nos. 103, 105 and 107, Brownhill Road, Lewisham, on the application of Norfolk & Prior, on behalf of Mrs. Staines. (*Consent.*)

Oriel windows and porches in front of four houses on the east side and four houses on the west side of Turney Road, Dulwich, on the application of G. A. Lansdown, on behalf of H. J. Williams. (*Consent.*)

A classroom addition on the east side of Oaklands Congregational Church, Uxbridge Road, Hammersmith, on the application of S. Powell, on behalf of the committee of the church. (*Consent.*)

An iron and glass porch in front of No. 73, Burnt-ash Hill, Lee, on the application of Stocker & Roberts, on behalf of F. W. Zuthorst. (*Consent.*)

Iron and glass porches in front of houses on the north-east and south-west sides of Chudleigh Road, Brockley, on the application of J. W. Heath & Sons. (*Consent.*)

Retention of a projecting shop front at No. 28, Arlington Road, St. Pancras, on the application of J. H. Hignell, on behalf of P. Natus. (*Consent.*)

A projecting flue on the eastern side of the Savoy Hotel extension to project in Savoy Buildings, on the further application of Colcutt & Hamp, on behalf of the Savoy Hotel, Ltd. (*Consent.*)

Oriel window and turret at the corner of Mill Hill, Place and Wimpole Street, St. Marylebone, on the application of W. Wallace, on behalf of Debenhams, Ltd. (*Consent.*)

Buildings on the west side of Brixton Hill, between Acre Lane and Hayter Road, Norwood, on the further application of Gush, Phillips, Walters & Williams, on behalf of R. A. Johnston and Miss C. S. T. Johnston. (*Refusal.*)

Buildings on the eastern side of Fulham Palace Road, abutting also upon the southern side of Childerley Street, Fulham, on the application of F. C. Cole, on behalf of the trustees of the Fulham Waste Land and Lygon Almshouses Charities. (*Refusal.*)

An iron sign upon the forecourt of No. 205, Clapham Road, Brixton, on the application of the Granville Motor Engineering Co. (*Refusal.*)

A building at the rear of No. 449, Fulham Road, Chelsea, to abut upon Gunter Grove, on the application of W. F. Hurdall. (*Refusal.*)

Porches to Nos. 7, 8, 9, 10, 11 and 12, Ruskin Walk, Herne Hill, on the application of A. M. Deacon, on behalf of R. E. Mayo. (*Refusal.*)

A building on the southern side of Eastcomb Avenue, Greenwich, to abut also upon the eastern side of Wynd-cliff Road, on the application of Beadel, Wood & Co., on behalf of the Norwich Union Life Insurance Society, and F. R. Barrett. (*Refusal.*)

Buildings on the west side of Belle Vue Crescent, Finchley Road, Hampstead, on the application of Brown & Barrow, on behalf of the trustees of the Burgess estate. (*Refusal.*)

An iron and glass-covered way at No. 38, Finchley Road, St. Marylebone, on the application of Ritchie & Co., on behalf of Mrs. Lupton. (*Refusal.*)

An iron and glass canopy and electric lamp in front of No. 37, Victoria Street, Westminster, on the application of Griffin & Woollard, on behalf of J. B. Martin, G. Hastings and H. Webley. (*Refusal.*)

A temporary wood and iron-covered way at the entrance to 97, Stamford Hill, Hackney, on the application of F. Tite, on behalf of Mrs. L. Tite. (*Refusal.*)

An iron and glass covered way at the entrance to the Islington Infirmary, Highgate Hill, Islington, on the application of W. Smith, on behalf of the Guardians of the Poor of the parish of St. Mary, Islington. (*Consent.*)

Buildings on part of the open space at the rear of Nos. 164 to 172 (even numbers only) inclusive, Earl's Court Road, Kensington, on the application of W. G. Hunt. (*Consent.*)

Building on Lot 11, Goldsmith's Row, Haggerston, on the application of F. B. Healy. (*Consent.*)

Three buildings on the western side of Tooting High Street, at the corner of Selkirk Road, Wandsworth, with irregular open spaces at the rear on the application of J. C. Radford, on behalf of C. S. Merrett. (*Consent.*)

An addition to No. 9, Southwick Place, Hyde Park, on the application of R. S. Ellis. (*Consent.*)

A house on the north-western side of Atherfold Street, Clapham, on the application of V. Vagnolini, on behalf of W. P. Goosey. (*Refusal.*)

Means of escape in case of fire on the top storey of "Craven House," Kingsway, on the application of H. Tanner, jun., on behalf of J. Mitchell & Co. (*Consent.*)

Means of escape in case of fire on the sixth (top) storey of Nos. 110 and 111, Fleet Street, City, on the application of Smees & Houchin, on behalf of Cook & Sons. (*Consent.*)

An addition to No. 247, Rotherhithe Street, Rotherhithe, such building and addition to exceed in extent 250,000, but not 450,000 cub. ft., and to be used only for silver and lead refining, on the application of M. T. Shaw & Co., Ltd., on behalf of H. J. Enthoven & Sons, Ltd. (*Consent.*)

Iron, brick and concrete additions to the generating station, Townmead Road, Fulham, on the application of A. J. Fuller, on behalf of the Metropolitan Borough of Fulham. (*Consent.*)

A sub-station on the site at the rear of Nos. 5 and 6, Blomfield Road, abutting upon Portsdown Road, Paddington, on the application of S. Highfield. (*Consent.*)

Residential flats on the site of Gloucester House, to abut upon Piccadilly and Park Lane, St. George, Hanover Square, on the application of Colcutt & Hamp, on behalf of J. J. Duveen. (*Consent.*)

The Theatres and Music Halls Committee also reported the following :—

Plans submitted by Rowland Plumbe, on behalf of the chairman and committee of the Central Young Men's Christian Association, showing how it is proposed to give effect to certain of the suggestions made by the Council for the structural improvement of Exeter Hall. (*Consent.*)

Plans submitted by R. H. Kerr showing certain alterations which have been made at the Gambrian Restaurant, Rupert Street. (*Consent.*)

Plans submitted by Owen & Ward showing an alteration proposed to be made in the arrangement of the balcony and circle tier at the Prince's Theatre, Poplar, now in course of erection. (*Refusal.*)

Plans submitted by Kings & Myers showing arrangements proposed to be adopted in the construction of a music-hall in Upper Tooting Road. The plans show that the hall will be one with two tiers above the ground floor. Accommodation is shown for 11,420 persons seated and 556 standing. The Committee are considering the whole question of standing in places of public entertainment, and think that the applicant should be informed that the approval of the present plans is subject to any decision that may be arrived at hereafter. (*Consent.*)

Conversion of the Putney Baths into a music-hall, on the application of W. Hancock. (*Consent.*)

Plans submitted by A. Davis, showing the arrangements at the Spitalfields Arcade, Fashion Street, in respect of which premises notice of intended application for a music licence has been received. The premises, which are in course of erection, will be used as a market, and consist of shops or booths on each side of two avenues which run the length of the building and are called North and South Avenues. On the first floor level there are also booths opening on to galleries connected by bridges. (*Consent.*)

A.A. CONVERSAZIONE.

THE annual conversazione of the Architectural Association was held on Friday evening at 18, Tufton Street, Westminster, where the president (Mr. E. Guy Dawber, F.R.I.B.A.) and his wife received a very large gathering. On the walls and in the classrooms were displayed photographs of the annual excursion to Lisieux and the week-end visit to Cambridge, and photographs by members of the Camera and Cycling Club, as well as a selection of students' work and architectural sketches. Altogether the evening was a great success.

"The Tufton Street Tatler."

The second "spasm" of this welcome periodical was issued at the conversazione, and its perusal provided the keenest enjoyment. The editors are to be congratulated on the many clever things contained in the publication. Two pages are devoted to "Mr. Ballee Rhott, M.S.A.—perhaps the greatest master of the Redundant Buttress and the originator of Puzzle Furniture": after which come some architectural verses in parody of Tennyson, Kipling, Swinburne and Gilbert—the last being as follows :—

If you want a receipt for that popular mystery Known to the world as "Art Nouveau" to-day, Take all the remarkable styles known to history, Rattle them off to this popular lay.

Pyramids pillaged by mad Egyptologists, Byzantine knowledge of stresses and strains, Those who are blatantly keen archaeologists, Study the question of Optical drains, The culture of Greece that was cribbed by the Romans, The luxury-loving Pompeian remains, The three styles of Gothic are sure of survival (Though save us, ye Gods, from another Revival Where Barrys and Burgesses clash as they meet The fancy of Pugin in every Street). The wit of the artists who reigned with Queen Anne, The skill of John Thorpe in devising a plan, Think of a Phidias or a Calliocrates, Christopher Wren or a William Wyke: that is Dead, to be followed by Matcham & Co., The Classic Revival, and Mr. Caroe!

Take of these elements all that is fusible, Melt them all down in a pipkin or crucible; Set them to simmer, and isn't it rum! Our boasted New Art is the layer of scum.

"Mr. Dooley on Arch-tects" is another amusing contribution, and the quips and oddities throughout the remainder of the issue are well worth reading. The fun is never bitter. We notice an addendum of additional courses about to be instituted, beginning with some lectures and demonstrations on the use of the English language as a means of expression—for Institute examiners (text-books: Kipling's "Barrack-room Ballads" and the Mazawattee Penny Primer) and including some intended for our own especial benefit: the list however is conspicuously incomplete and we respectfully suggest the following addition :—

Lectures on Purple Puerilities.

For Budding Journalists.

Lecturer: Mr. Ballee Rhott.

Text-Books: Back numbers of "Truth" and Ireland on "Mental Afflictions."

"The Tufton Street Tatler" is obtainable from Messrs. Farmer & Sons, Kensington High Street, price 6d. (post free, 7d.).

Competitions.

Library, Cheshunt.—The competition for a public library at Cheshunt has been decided as follows :—1st, Mr. J. Myrtle Smith, Chelsea; 2nd, Mr. Ernest A. Sudbury, of Nottingham; 3rd, Mr. Richard Wylie, of Gateshead.

Library, Greenwich.—In the competition for a branch library at Greenwich the time for submitting designs (originally fixed for November 4th) has been extended to four weeks after the answers to competitors' questions are posted, which will be shortly.

A Library Competition.—Encouraged by a promised gift of £40,000 from Mr. Carnegie, the St. Pancras Council has prepared a scheme for the erection of a central library in the Prince of Wales Road and of four branch libraries. £20,000 is to be spent on the central building, for which a competition is to be held with Sir Aston Webb as assessor.

School, Carlisle.—The competition for a new school to be built at a cost of £12,000 in Norman Street, Carlisle, has been decided as follows :—1st premium (£75), Messrs. Oliver & Dodgshun; 2nd (£30), Mr. F. Lishman; 3rd (£20), Mr. J. W. Benwell—all of Carlisle. Five designs were submitted, the assessor being Mr. Walter H. Brierley.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE annual meeting of this Society was held on Thursday last, the president (Mr. G. Bertram Bulmer, F.R.I.B.A.) occupying the chair. The annual report, which was presented and adopted, showed that during the year ending April 30th last the membership had increased from 155 to 174, while the accounts showed a small balance in hand. It was noted in the report that the School of Architecture, under the auspices of the Society, in conjunction with the Leeds Institute and the Leeds University, was proving of great value in preparing students for the R.I.B.A. examinations. Considering the

Conditions of Architectural Competitions, a circular had been drafted pledging the signatory not to submit plans in any competition promoted within the area of the Society unless the conditions accorded with the spirit of the suggestions for the conduct of architectural competitions issued by the Royal Institute of British Architects. This circular had been signed by more than thirty members of the Society.

THE TIMBER TRADE.

London Market in October.

THE London wood market may be said to have improved all round during October. It is an indirect improvement, inasmuch as it does not consist of any actual rise of prices on the spot, nor is it contingent on the more important item of an increase in the local consumption, but it is none the less a real improvement in tone, based on the increasing consumption in other home markets, on a better general trade throughout the country, and on the practical certainty that no further supplies are likely to be laid down here either this year or next at prices which will compete with stocks already here. The October importation was, Messrs. Churchill & Sim state, a small one, and the London consumption also remains small, showing a reduction of 1,200 standards from the docks and of 700 standards overside from the figures for October, 1904. The reduction in the dock stock may now be reckoned at 20,000 standards from that of last year.

Messrs. Denny, Mott and Dickson, Ltd., observe that business during October was marked by an advance in price in most descriptions of wood goods—even the so-long-depressed market for soft woods having felt the influence of the general confidence in better business. The volume of demand during the month was not all that could be wished, but the increased cost of replacing most stocks has become a hard fact, and the indisputable rise in iron and steel is one of the several indications that the demand for structural work has revived in all directions; and it is a mere matter of time as to wood following the movement in price of other material.

Dock Stock.

The stock of wood in the public docks on October 31st was:—

	Pieces.
Foreign deals and ends - - -	1,845,000
Do. battens - - -	2,854,000
Pine deals and battens - - -	982,000
Spruce do. do. - - -	897,000
Boards, rough - - -	4,294,000
Do. prepared - - -	6,841,000

Totalling 17,715,000 pieces, as compared with 20,195,000 in 1904, 22,280,000 in 1903, and 25,025,000 in 1902.

In other kinds the stock was as follows:—

Foreign wainscot logs - - -	89 pieces.
Do. oak timber - - -	665 loads.
Do. fir timber - - -	1,518 do.
Do. Oregon pine, &c., spars and masts - - -	3,897 do.
Colonial oak timber - - -	1,643 do.
Do. birch timber and planks - - -	5,474 do.
Do. elm and ash timber - - -	1,210 do.
Do. yellow pine - - -	577 do.
Do. red pine - - -	94 do.
United States pitch-pine timber - - -	13,488 do.
Do. do. deals - - -	43,000 pieces.
East India teak - - -	7,556 loads.

The deliveries for the first ten months have been of:—

	Pieces.
Foreign deals and ends - - -	2,605,000
Do. battens - - -	4,808,000
Pine deals and battens - - -	886,000
Spruce do. do. - - -	1,171,000
Boards, rough - - -	4,456,000
Do. prepared - - -	12,546,000

Totalling 26,472,000 pieces, as compared with 28,591,000 in 1904, 30,654,000 for 1903, and 32,557,000 for 1902.

The deliveries for October were:—

	Pieces.
Foreign deals and ends - - -	258,000
Do. battens - - -	458,000

Pine deals and battens - - -	104,000
Spruce do. do. - - -	115,000
Boards, rough - - -	481,000
Do. prepared - - -	1,244,000

Totalling 2,660,000 pieces, as compared with 2,829,000 in 1904, 3,019,000 in 1903, and 3,478,000 in 1902.

Deliveries from Ship to Craft.

The deliveries direct from ship to craft for the first ten months of the year have been:—

	P.s.h.	1904.	1903.	1902.
Deals and battens	103,517	97,226	102,061	97,451
Boards - - -	22,204	17,085	20,717	20,955

Total - 125,721 114,311 122,778 118,406

and for October:—

	P.s.h.	P.s.h.	P.s.h.	P.s.h.
Deals and battens	11,125	12,263	13,211	9,544
Boards - - -	2,479	2,029	1,630	2,207

Total - 13,604 14,292 14,841 11,851

Soft Woods.

Swedish Deals and Battens.—The arrivals from the Swedish ports during October were on a very restricted scale, deals, battens and flooring being all far short of what was sent here in October last year. For deals and battens there is no change of price to report since September, but flooring rates have moved up smartly here and there under the influence of a fractional improvement in the demand.

Norwegian Boards.—The quantity of prepared boards imported during October was just under that for October last year, and the demand has been better than for some time past. Prices tend to improve, but without much life in the movement so far.

Russian Deals.—The importation from Russia during October was a very small one, deal sizes in particular showing a great reduction on the figures for October last year. There has been very little improvement in prices on the spot so far, but the c.i.f. prices paid for arrival for the last of the shipments something more than cover the increased rates for freight and insurance.

Finnish Battens.—The supply of Finnish battens during October was slightly under that for October last year. There was no improvement in prices in London.

Prussian Timber.—There was no pressure of fresh supplies of fir timber during October, but the demand has been wretched, and the market has no strength of any sort. For oak timber a little more demand has been experienced, sufficient to carry off a fair proportion of the small stock at rates which leave some profit to importers on the low summer cost.

Canadian Timber.—The importation of pine deals into London continues very restricted. The consumption in October improved. Prices have responded to this latter influence, and are a point or two higher than in September. For spruce deals a great change has come over the market, the improvement which made itself felt in September having developed with much rapidity during the past month. The London market is quite left behind, and shows its usual indifference to rates which it cannot afford to pay; prices are nevertheless up, but not to the same extent as elsewhere. In hardwoods, birch is the most improving property at the moment; oak, elm, and ash being very much neglected. Yellow-pine timber is, perhaps, also better so far as there

is a market for it here at all. The fresh arrivals of sawn timber were on a better scale during October. The deliveries were very poor, showing a reduction of 1,600 loads of floated timber on those for October, 1904. Consequently London prices have been influenced only by the conditions in the shipping marks, where they are advancing week by week and form a barrier far ahead against any possibility of replacing wood sold here at the present quotations. Pitch-pine deals, too, are affected by much the same causes and have improved in price. The month's importation was, however, a full one.

Hardwoods.

Teak.—Messrs. Denny, Mott & Dickson, Ltd., state that the landings in the London docks during October consisted of 585 loads of logs and 252 loads of planks and scantlings, or a total of 837 loads as against 202 loads for the corresponding month of last year. The deliveries into consumption were 270 loads of logs and 342 loads of planks and scantlings—together 612 loads, as against 960 loads for October, 1904. The continued small import of teak is the more disquieting seeing that nearly half of such import consists of Java wood, which, owing to its want of good length and its being heavier than Burmah wood, is not liked for some descriptions of first-class work. It should, however, be recognized by those responsible for the small production (and consequently almost prohibitive present prices) of teak in India—whether Government Forest Administrators or commercial concessionaries of forests—that the production of a part of the British Empire is being discouraged at the cost of the European consumer learning to put his money into the pocket of a Dutch possession; and as Siam teak has continued to displace the consumption of Burmah teak, notwithstanding the original prejudice against it, so will the consumption of Java teak develop and the consumer accommodate himself to the shorter lengths and greater weight, if the undoubtedly superior description from Burmah is not procurable except at an unreasonable high comparative cost. These facts are sufficiently significant to merit the serious consideration of all concerned, both in India and Siam, whilst the merchant on this side can only utilize such facts as may be most advantageous to his business, which admits of little sentiment.

Messrs. C. Leary & Co. report that a healthy general demand, together with the Government requirements for the service of the various dockyards for the coming year (although the latter are on a smaller scale than for several years past), are factors making for a further rise in values. Offers which constitute a distinct advance on recent quotations have been refused by sellers, a course for which the future will almost certainly show there were good grounds.

Mahogany.—The consumption during October was fairly satisfactory, especially for the better class of sizeable wood. Honduras and African descriptions have arrived to hand in sufficient quantity, but the supply of Tobacco is short, and the commencing new season's imports will be welcome. Values, on the whole, while steady, have not appreciably altered.

ABSTRACT OF STOCK, CONSUMPTION, &c., FOR OCTOBER.

S.C. Dks. and M. Dks.	Deals (Fir).	Battens (Fir).	Pine.	Spruce.	Pitch-pine Deals.	Deals and Battens in Aggregate.	Rough Boards (All Countries).	Flooring.	Floated Timber.

LIVERPOOL TIMBER TRADE.

(By our Own Correspondent.)

THE increased activity in the timber trade reported last month has been fully sustained, a good demand being experienced for builders' and cabinet-makers' woods. In builders' woods the local and country consumption of deals and boards continues active. The large mill-building operations in the Manchester district, the building of the Stockport Town Hall, and the erection of shop and residential property in many places in the district, is now proceeding vigorously; and more or less timber, chiefly for roof and floor work, with a necessary quantum of round pole stuff for special building, is being used in connection with the operations. The dispatchings by rail from the Derby Road and Regent Road yards have therefore been considerable. The near approach of the time at which steamers will cease to carry deck loads of timber for the winter season, and the talk about the closing of the importing season, has had a hardening effect on prices, and has given rise to free speculations as to the quantity of spruce which will be coming forward. There is no doubt, however, that spruce will continue to come forward freely, though perhaps not in large quantities, through being shipped as filling-out cargo, and taken readily enough by shipowners when more profitable freight is not at hand. The stock is slightly below that at the corresponding date of last year, but it is still considerable. As a matter of fact, the present stock would serve for a three months' consumption. Prices have been very firm, and seem likely to harden. Among the more recent arrivals in this department have been a consignment of 450 standards of pine deals from Montreal by Watson & Todd, a cargo of spruce by David Roberts & Co., pine deals and boards by Robert Cox & Co., and, in cut timber, consignments of flooring boards by Jonathan Gray. Whitewood has been in steady demand. Stocks, though not large, are quite equal to the consumption, and there has been a replenishing to a fair extent.

Framed woodwork continues to come to hand steadily. Among the important arrivals have been about 7,000 doors by John J. Swan.

Pitch pine.

The pitch pine market has been in a strong position, the demand for planks and sawn timber being good and steady, and the stacks of both kinds being smaller than at the corresponding date last year. Values are higher, mainly through the higher freights demanded at the ports of shipment. Stocks, though smaller, seem ample for present requirements.

Oak; Mahogany.

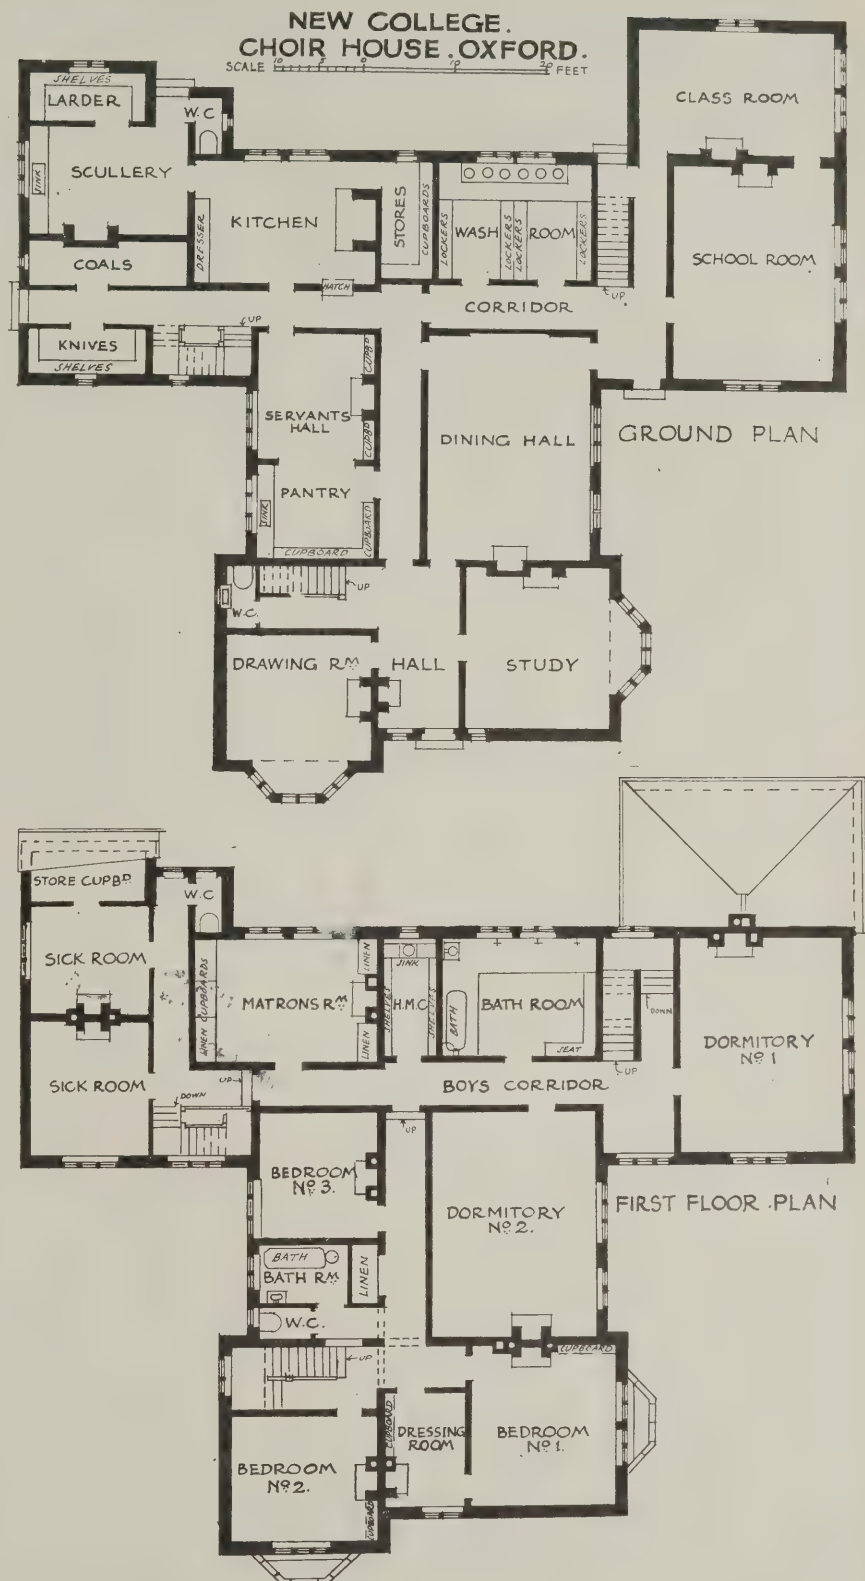

Oak planks have been in fair and steady consumption.

The sales of mahogany at the auctions held on October 19th and 20th were unusually large; 3,016 logs, representing 2,071,765 ft., being disposed of.

On October 19th the largest clearance was of Benin wood—about 606 logs—the price ranging from 2½d. to 1s. 5d. per foot. Lagos ranged from 2½d. to 8½d., and about forty logs of attractive Labou wood were taken up at prices ranging from 3½d. to 3s. 7d.

On October 20th the largest clearance was of Axim wood, 594 logs of this being sold at prices ranging from 2½d. to 1s. 9d. The event of the day, however, was the selling of a log of Grand Bassam, finely figured, at 6s. 1d. per ft. St. Domingo mahogany sold freely, 233 logs being taken at prices ranging from 3½d. to 10½d.

At Messrs. Alfred Dobell & Co.'s sale five logs of African walnut were offered and taken at prices ranging from 1½d. to 3½d. A consignment of teak, measuring 361 cub. ft.,

which was also offered, brought 1s. 7d. per cub. ft.

Cutting.

No sign of slackness has been noticeable at the Derby Road or Regent Road mills. The demand for wood on builders' account has kept the mills well employed, and they continue so at the present time.

The Musée des Arts Decoratifs is the latest addition to the public galleries of Paris. It is situated in the Pavillon de Marsan—the north-western block of the Louvre.

OUR PLATES.

THE choir schoolhouse for New College, Oxford, was completed in 1903 on a site just east of Wadham College Gardens. The walling and dressings are of Douling stone, and the roof is covered with hand-made red tiles. The schoolhouse contains ample accommodation for twenty-five boys, besides a master's residence. The work was carried out by Messrs. Benfield & Loxley, of Oxford, the architects being Messrs. Nicholson & Corlette, of London.

Keystones.

The Sanitary Inspectors' Association now has a membership of 1,053.

Change of Address.—Mr. Ernest Cannell, M.S.A., has removed from 18 and 19, Ironmonger Lane, E.C., to 51, Borough High Street, London Bridge, S.E.

The Welsh National War Memorial is to be erected on a site in Cathays Park, Cardiff, at the end of the avenue between the new town hall and the new law courts.

New Glasgow Premises.—New premises at 122 and 128, St. Vincent Street, Glasgow, for the Edinburgh Life Assurance Co., have been erected from designs by Mr. John A. Campbell, of Glasgow.

New Premises for the Preston Savings Bank are being erected in Church Street at an estimated cost of £25,000. The banking-room will be 60ft. square and 20ft. high, and the floor will be laid with india-rubber tiles. On the first floor will be a board-room 36ft. by 27ft. and departments for investment and new deposit accounts. Mr. Thwaites is the architect and Mr. Charles Walker the contractor.

Westminster Improvement Scheme Adopted.—At last week's meeting the London County Council adopted the proposal of the Improvements Committee to lease to the Victoria Embankment Syndicate, Ltd., for ninety-nine years, the whole of the surplus land from the Westminster improvement, at an ultimate ground rent calculated to produce 4 per cent. per annum on the cost of the improvement.

Chelsea Embankment Extension.—The Chelsea Borough Council decided last week to invite the London County Council to undertake the extension of the Chelsea Embankment from its present termination at Battersea Bridge to the "Cremorne Arms" public-house. Mr. W. D. Caröe, of Cheyne Walk, has written intimating that the proposal will be again strenuously opposed by local residents.

The new Church of All Saints, Ealing Common, which has been erected in memory of the Right Hon. Spencer Perceval, Prime Minister of England, who was assassinated on leaving the House of Commons in 1812, was consecrated by the Bishop of London last week. The church stands in the grounds of Mr. Perceval's former residence, and has cost £13,500. Mr. William A. Pite, F.R.I.B.A., was the architect.

A proposal by Mr. Bodley.—As a solution of the difficulty of future interments in Westminster Abbey, Mr. G. F. Bodley, R.A., calls to mind the "Campo Santo" at Pisa, and suggests that the space in Dean's Yard, now surrounded by iron railings, might be treated in some such manner. "Externally there could be four walls, and within them a wide cloister-like building, the inner walls having many glazed windows. The four long blank walls would afford much space for the monuments of many coming years. There could be four arches into the cloister with bronze gates and a cross walk."

An Amalgamation.—Messrs. Orenstein & Koppel, of Bush Lane House, Cannon Street, E.C., have amalgamated with Mr. Arthur Koppel, maker of tipping wagons, concrete mixers, &c., and the combined business of the two firms in the United Kingdom is now carried on under the style of Messrs. Arthur Koppel at 27, Clement's Lane, E.C. The staff of both firms has been retained, and standard types and sizes of all plant previously supplied by either firm, as well as spare parts and fittings for renewals or repairs, will be stocked for immediate delivery. The total combined paid-up capital of the two firms is £1,100,000.

New Episcopal Palace.—The Bishop of Southwell (Dr. Hoskyns) has decided to build an episcopal house at Southwell. The cost of the building, plans for which are now under consideration, is estimated at about £12,000.

The Further Strand Improvement Committee resolved last week to make another appeal to the London County Council to set back the northern frontage of the 'Strand' "island" east of the Gaiety block in order to give the roadway its natural course direct to the Law Courts and bring the thoroughfare into alignment with the church of St. Mary-le-Strand.

The Gladstone Monument in the Strand, close to St. Clement Danes Church, was unveiled on Saturday by Mr. John Morley. In the architectural details Mr. Thornycroft, the sculptor, had the assistance of Mr. John Lee. The bronze casting has been done by Messrs. Singer, of Frome, and the masonry by Messrs. Adamson, of Putney. The monument rests upon a bed of cement-concrete 19ft. thick.

New Municipal Buildings at Tottenham were opened on Thursday last. They include a town hall, municipal offices, public baths, fire-station, coroner's court and mortuary, and a depot. The cost has been £70,000. The architects were Messrs. Taylor & Jemmett, and the builders Messrs. Lawrence & Son, of Tottenham. The engineering plant was supplied and erected by Messrs. Ashwell & Nesbit, Ltd., of London.

The Old Parliament House Hall in Edinburgh has been restored under the direction of Sir James Guthrie, P.R.S.A. The old oak roof has been cleared of all varnish with the aid of chemicals and the natural colour retained: while the carved stone corbels have had the paint and gilt removed. A new floor in large squares of oak and teak has been laid, and the walls have been treated so as to represent stone colour.

The new Building of the Working Men's College in Crowndale Road, St. Pancras, has been opened for classes, although it is not yet completed. It has been designed by Mr. W. D. Caröe, and will contain, in addition to a hall seating 400 persons, a large library, museum, gymnasium, common and coffee rooms, an art room, and a large number of classrooms. A special feature will be the laboratories for chemistry, physics and botany, which are not intended for technical instruction but for scientific study.

The new City Hall at Belfast is nearing completion, and May next is spoken of as a likely month for the formal opening. The architect is Mr. A. Brumwell Thomas, F.R.I.B.A., of London. The foundation-stone was laid seven years ago. The building has a frontage of 305ft., with a depth of 240ft., and its total cost is stated to be £350,000. Rich marbles have been used profusely on the interior. The council-chamber is 80ft. by 40ft., with a large reception-room adjoining; the banqueting hall will accommodate between 300 and 400 people, and the public hall is 113ft. by 57ft.

Widening of Blackfriars Bridge.—At last Thursday's meeting of the City Corporation it was decided to promote a Bill in Parliament for powers to widen Blackfriars Bridge to an extent not exceeding 40ft., the Bill to be comprehensive enough to enable that corporation, if necessary, to round off the north-west corner of the bridge. The proposal is conditional on the London County Council obtaining powers to run trams over Westminster and Blackfriars Bridges and along the Embankment. It is proposed also to construct a subway for passengers under the roadway at the northern end of Blackfriars Bridge.

The R.I.B.A. Kalendar for 1905-1906 has just been issued, price 2s. 6d.

Holy Trinity Church, Exmouth.—The foundation stone of the work of restoring and enlarging this church was laid recently. Mr. G. H. Fellowes Prynne is the architect. The cost of the work will be £6,092.

The Greenwich Central Library, at the corner of Woolwich Road and Tunnel Avenue, was opened on Saturday by the mayor (Mr. Donald McCall). For the building of this and a branch library Mr. Andrew Carnegie gave £13,000. Mr. Sydney Smith, F.R.I.B.A., was the architect.

Builders' Notes.

Rolled Steel Beams 24in. high by 7½in. flanges, by 100 lbs. per foot, are now being rolled of Siemens-Martin steel (acid process) at the Lanarkshire Steel Works. This section is No. 30 on the British Standard Beam list, and is the largest steel section at present rolled in Great Britain.

A Meeting of Creditors of William Winnard, builder and contractor, Wigan, was held in Liverpool on Friday last. The statement of affairs showed total liabilities £10,947 and nett assets £10,556, leaving a deficiency of £391. As the debtor expects to be able to obtain an advance of £5,000 from friends, the meeting was adjourned for a fortnight so that some definite proposal may be laid before the creditors.

Partitions in an Actual Fire.—A few ago a fire broke out in the "Telegraph" weeks Chambers, Market Street, Bradford, in a room almost in the centre of the building, but all the floors and partitions were of fire resisting construction, the latter being supplied by the Fireproof Plate Wall Co. of Bradford and London. The fire did not spread; although the room was completely gutted, the adjoining rooms were untouched by fire.

The Effectiveness of "Uralite" as a Fire Stop.—A fire occurred recently in a cottage at Colwood Hill, Bolney, Hayward's Heath, caused by the composition which workmen were using in laying floor blocks becoming ignited. At one time the fire looked serious, but "Uralite" ceilings had been fixed in the cottage, and they effectually prevented the fire reaching the floor above, otherwise the fire would certainly have burnt the cottage to the ground, and might have destroyed a good deal of property adjoining.

Messrs. Spencer, Santo & Co., Ltd., despite the fact that the building trade has not been particularly flourishing of late, appear from the interim dividend announcement issued last week to have done much better than during the corresponding six months of last year. The rate declared for the past half year on the ordinary shares is 8 per cent. per annum, which is an increase of 2½ per cent. on the rate for the first half of 1904. This suggests that at the end of the year the firm may establish a higher level for its annual distribution than the 10 per cent. which has been paid for the past three years.

Scottish Building Trades' Federation.—The annual meeting of this federation was held recently at Inverness, the chair being occupied by the president, Mr. William Macdonald, carpenter contractor, of Inverness. The report stated that the finances of the federation were now on even a better footing than when the year began, but the executive much regretted that the state of trade throughout the country continued dull and depressed. There was, however, some reason to hope that the tide was now turning. Mr. P. Knox, plumber, of Edinburgh, was elected president for the ensuing year, and Mr. James Cameron, solicitor, of Edinburgh, was appointed secretary.

Law Cases.

The Employment of Day Labourers on Building Work.—An important building trade case was heard by the stipendiary magistrate at the Manchester City Police Court last week affecting the employment of day labourers. The defendants, Messrs. Redston & Co., plasterers and painters, were sued by three labourers, members of the Manchester and Salford Operative Plasterers' Labourers' Association, for a sum of about 8s. each as payment for the time they were kept waiting for their wages. Mr. Merriman, for the complainants, stated that the men were engaged at the rate of 7d. an hour at the new Manchester fire station, on which building the defendant firm had a sub-contract. On Thursday, October 12th, they were told to "stand down" owing to the supply of material having run short. The men asked to be paid for the work they had done, but this was refused and they were told they would have to wait. Between Thursday and Saturday they went several times for their wages, but did not get them until noon on Saturday, when the amount handed to them did not include the time they had been kept waiting. Mr. Merriman said the case was brought under the Employers' and Workmen's Act, 1875, and the Association to which the complainants belonged regarded the matter as important, because a question of principle was involved. It was a rule of the Association that men after receiving notice were either to receive the wages due to them or be paid for the time they were kept waiting. The stipendiary asked whether the men, having been told to "stand down," were still in service of their employers, or whether they were at liberty to seek work elsewhere at once. In reply Mr. Judson, for Messrs. Redston, stated that the men were not really dismissed by being told to "stand down," but before they could leave there must be notice given. The stipendiary asked what would be the position of a man who went to look for another job immediately on being told to "stand down"—would he be liable to be sued for breach of contract? Mr. Judson said he supposed that the man would be technically liable, but no such proceedings had ever been taken. Witnesses were called for the defence, and one of them who had spoken of frequent stoppages because of frost and rain admitted in answer to Mr. Merriman that in such circumstances the men had little chance of getting employment elsewhere, and would simply wait for a resumption at the same job. In giving judgment for the complainants for the amount claimed the stipendiary said that even on the evidence for the defendants the labourers would have been entitled to seek work elsewhere on being told to "stand down." It seemed to him that, according to the rules of the Association, if a man insisted on it, he had a right to be paid at once or be compensated for the time he was kept waiting. He gave judgment for the complainants for the amount claimed, and in addition their expenses for attending court.

A Bradford Architect and his Pupil: Amusing Case.—At the Bradford County Court last week, before his Honour Judge Bompas, James Edgar Adamson (aged 18), suing through his father, Mr. James J. Adamson, architect, of Hull, brought an action against Mr. H. E. Priestley, architect, of Bradford, to recover damages for breach of an indenture of apprenticeship. Defendant counter-claimed for £50. On behalf of the plaintiff it was stated that Mr. Priestley, in consideration of a premium of £52—half to be paid down and half at a subsequent date—agreed to take the plaintiff as an articled pupil, and indentures were signed for four years from September 1st, 1903. After a few months the plaintiff found that he was

not making satisfactory progress in the defendant's office, where there was very little to do, and where he was nothing more than an office boy. In consequence of representations made to his father, the latter, when the second half of the premium became due, paid only half of it, and correspondence ensued in which the defendant met Mr. Adamson's complaints by counter-charges against the plaintiff. Eventually the plaintiff went home to consult his father, and the defendant wrote saying that he would not receive him back.—The plaintiff, in evidence, said that when he went to Mr. Priestley's office there was one assistant and himself. The assistant subsequently left, and Mr. Priestley took another pupil. There was never much to do, and during the last year business was very slack. Witness had to do tracing and office-boy's work—copying and posting letters, copying insurance policies and collecting premiums. He had very little instruction in the preparation of plans, and was not taught to get out specifications or quantities, though he several times asked for instruction in these departments.—The defendant said that during the time plaintiff was with him he had so much work that his health broke down several times. He had in hand a great many buildings in Bradford, and numerous drawings for architects up and down the country. He had no complaint to make as to the plaintiff's ability. The plaintiff was able when he was willing, but he was not always willing. Moreover, he was guilty of "gross wickedness" from February, 1904, onwards. Defendant computed roughly that plaintiff had done about £20 worth of damage in the office to instruments, drawing-boards, T-squares and writing-tables. Nearly every piece of furniture in the office was disfigured with grinning faces, Union Jacks, soldiers' helmets and a hundred other devices. Plaintiff had also made personal statements, and at an examination had misstated his age, and had sold his exhibition ticket—"a perfectly illegal thing to do."—Mrs. Priestley, the defendant's wife, gave evidence as to the damage done

ACTON WESLEYAN CHURCH. REGINALD T. LONGDEN, ARCHITECT.

This is a small country church with seating accommodation for about 120. It consists of nave, vestries, stores and lavatories at rear. The building is built of sand-faced stocks (of a cherry-red colour), with wide mortar joints, stone dressings and red tile roof. The outside woodwork is painted white, and inside light green stained and varnished pine; glazing, lead lights. The main gable is cement rough-cast, distempered ivory white. The general contractor was Mr. S. Wilton, junr., of Newcastle-under-Lyme, and the architect Mr. Reginald T. Longden, of Burslem.

by the plaintiff at the office. Among other things, Mrs. Priestley said he was in the habit of letting lead weights drop on the floor, which she believed was done to annoy her in the room below.—His Honour reserved judgment.

Heavy Claim against Dublin.—At Dublin last week an action was heard in which Messrs. Pearson & Sons, contractors, of London, sued the Corporation of Dublin for £36,374 in connection with the city outfall and purification works at North Wall. It was stated that the claim was owing to the carelessness of the corporation in stating that the harbour wall was watertight where the works were to be erected. It was found that the walls were only of dry stone, and to carry out their contract Messrs. Pearson had to incur the expense which constituted the claim. Judgment was given in their favour.

An Architect's Claim.—At West Bromwich County Court last week, before Judge Smith, Mr. S. E. Siddaway, architect and surveyor, of West Bromwich, brought an action against Mr. H. W. Haynes, rope and twine manufacturer, Birmingham, for £9 9s. for professional charges. The case for the plaintiff was that he was engaged by the defendant to survey and plot out some land in Nineveh Road, Birmingham, and also to prepare plans and tracings of a house and outbuildings. These, together with 2½ per cent. commission on an estimated sum of £369, brought his charges up to the amount claimed. Defendant pleaded that he only engaged the plaintiff to provide a pencil sketch, and that it was impracticable to put a house of the value of £369 on the land. The whole scheme was too elaborate. The judge gave a verdict for the full amount claimed, with costs.

New Baptist Church and Schools, Wavertree, Liverpool, have been erected from designs by Messrs. George Baines & Son, architects, of London, at a cost of £8,693. The church seats 775 persons, the seating being circular on plan, and is arranged for future extension by galleries to seat over 1,250 persons.

R.I.B.A.

MR. BELCHER'S PRESIDENTIAL ADDRESS.

THE opening meeting of the session of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the chair being occupied by the president, Mr. John Belcher, A.R.A.

Mr. Alex. Graham referred to the losses of the Institute by death since the last meeting, and proposed that a letter of sympathy should be sent to Mrs. Waterhouse and family expressing heartfelt sympathy with them in their bereavement and appreciation of the late Mr. Waterhouse's excellent work, the many monuments of architectural art which he had left behind him, the many acts of kindness shown to members, and the great interest he took in the Institute.

Mr. Graham also proposed that a letter of sympathy be sent to the widow and family of the late Mr. Charles Forster Hayward expressing appreciation of the services he rendered to the Institute, and of his worth and merit during a long and active career.

The secretary announced that the following had passed the examination held last November qualifying them to practise as district surveyors under the London Building Act:—A. A. Fillary, E. W. Knight, E. Palser, H. T. B. Spencer, A. L. Woodward; and that Mr. W. J. Stainton had been granted a certificate of competency to act as a building surveyor under local authorities.

Mr. Belcher then delivered his presidential address. After referring to the confidence and goodwill of his brother architects, to which he was indebted—"a source of no small encouragement to me, in view of the difficulties likely to attend on my position as president during the period upon which we are now entering"—Mr. Belcher said their membership had increased considerably during the past year, partly no doubt to the determination of the Institute to close its doors against all who had not passed a qualifying examination. But their losses, too, had been numerous, including

Mr. Alfred Waterhouse, R.A.,

to whom Mr. Belcher referred as veritably one of the giants of our days, and that it might fairly be claimed for him that he developed a phase of art—consistently followed to the last—as peculiarly his own as that of the brothers Adam was characteristic of them in another direction.

Regent Street Quadrant.

Proceeding to deal with the public works in London to which he had referred in his address last year, the president said they were rapidly approaching completion, and in the City the Old Bailey buildings were progressing well. The pulling down of a large portion of the Regent Street Quadrant had been the occasion of considerable anxiety, the more so because buildings recently erected on other Crown property near by exhibited a total disregard for their surroundings, and indeed for any general scheme such as that devised by Nash, to which Regent Street owed its peculiar character and value. The present officials, however, recognizing the mistake made in the past, had determined to use their powers to retain a uniform treatment of the Quadrant at least. The need for such uniform treatment was so strongly felt by architects that had it not become known that Mr. Norman Shaw had been engaged upon a design of a façade for all the buildings in the Quadrant, there would have been a general outcry. Mr. Belcher said he had reason to believe now that, thanks to the wisdom of the authorities and the compliance of the County Council, to whose architect we owed much, in respect of such portions as were under their control, there would be achieved a memorable work

and a noble termination to Regent Street worthy of a great city.

Mr. Belcher next referred to the proposed new Wesleyan Hall in Westminster, remarking that the successful architects, Messrs. Lanchester & Rickards, were run very close by others, the design of Messrs. Cross & Mallows in particular presenting many delightful features. He then spoke of

The important new Buildings at Cardiff.

where again Messrs. Lanchester & Rickards were very much in evidence. The town hall and law courts promised to be amongst the most successful buildings of our day. Simple in plan, convenient in arrangement, fine in scale, decorated with just the proper amount of ornament, they would combine with the new university buildings by Mr. Caröe, the library and museum by Mr. Seward, and a small but excellent building by Mr. Wills, to form a remarkable group—situated in beautiful park-like grounds—of which Cardiff might well be proud; and by the far-seeing liberality of the authorities the architects of the municipal buildings had been enabled to avail themselves of the assistance of some of our best sculptors in giving force and expression to the buildings.

Mr. Belcher next spoke of

A new Official Home for the Institute.

Owing to the increase of official work, the growth of the library, and the need of more space for the exhibition of students' drawings and the display of their many treasures, the premises in Conduit Street were daily proving more inadequate, and as they could not be extended the council had been compelled to look elsewhere. After many fruitless enquiries and attempts, they were now prepared to recommend the acquisition of a fine freehold site which had been found in Portland Place—the matter having been considered by a special committee of past presidents, as well as by the council and the finance committee.

The Architects' Benevolent Society was next spoken of, and an appeal made for subscriptions, as the amount received was totally inadequate to meet the deserving cases which should be relieved.

Competitions.

Dealing with this subject, Mr. Belcher said: "Every assistance has been rendered to public bodies who have sought for information or advice, and it is now the almost universal custom to request your president to nominate an assessor in competitions. In such competitions I note that the regulations issued by the Institute are generally adopted; but it would be greatly to the advantage of all parties concerned if, whenever it is proposed to introduce a variation or insert a special clause, such variation or special clause were first supervised by the assessor. The latter is bound to insist upon the conditions laid down, and any vagueness or uncertainty in technical details—often to the lay mind of no seeming importance—is apt to prove exceedingly unfair to competitors."

"It is of great importance also that public bodies, while reserving to themselves the right of confirming the assessor's decision, should be very slow to override or pass it by. Only a man of considerable practical experience and training in architectural work can lay his finger upon the impracticability or carefully-masked faults which mar the designs of so large a proportion of competitors; and to think that it is sufficient for a layman or any body of laymen to know 'what they like' (to use an expression often heard in such matters) is almost to set a premium upon work which is showy but intrinsically bad. It is the duty of this Institute to lead the way in discerning and approving all that is good and pure in architecture, and to recognize, and so far as

possible reward, those qualities which ensure the best results.

"The want of discrimination shown in some official and other circles, particularly in the provinces, lends much force and point to the demand for the registration of architects as being one way at least of counteracting the injustice so often done to competent men."

Registration.

Of this Mr. Belcher said: "The committee appointed by the general body to consider the principle of registration has now reported and gone so far as to suggest a form of Bill in Parliament. There is, however, considerable diversity of opinion still, and it is scarcely possible that the Bill should pass into law. Yet some remedy must be found for the present evils; we cannot be indifferent to the interests of the many able men upon whom existing conditions press so hard. Your new registration committee has therefore already appointed a sub-committee to examine impartially into the whole question. This committee, which is composed of men holding diverse, even opposite, views, is to receive and consider the evidence of those, whether members of the Institute or not, who may be either in favour of or opposed to compulsory registration, or who have suggestions of any kind which may help the committee to formulate a scheme which they can recommend. And any of the members in the provinces who may wish to offer suggestions or furnish evidence should communicate with the secretary as soon as possible. This should not occupy any great length of time; but what is done must be thorough, and we must arrive at a final solution of the question. Should the committee find it desirable to promote a Bill in Parliament, we must not risk failure or court defeat by presenting one which, owing to the opposition it arouses, has no chance of passing."

Proceeding, Mr. Belcher said the coming year would mark an epoch in the history of the Institute, for at its close only those who had qualified for the ranks of the Associates would be elected to full membership. Ample provision would be made for the needs of those who thus sought to qualify, and all the necessary educational facilities would be complete.

The Education Question.

"The Institute intends to take up this question on the basis laid down by the Board of Education and to give it its full support, and I am glad to be able to announce that this being so I have received an intimation from some twelve well-known architects that they are willing to join the Institute and work with us in advancing by every means in their power this most important question of architectural education."

"The new Board of Architectural Education formed for this purpose has, after long deliberation, issued a report which has been approved by the council and by all the educational bodies interested. The aims and methods proposed for adoption were admirably set out at one of our meetings by Mr. Reginald Blomfield, A.R.A., one of the hon. secretaries. The board is constituted on a very broad basis, its advisory members, for instance, including representatives of the Royal Academy, the Universities of Oxford, Cambridge and London, the Board of Education, the London County Council, University College, King's College, the Universities of Liverpool and Manchester, University College, Cardiff, the Architectural Association day school, and the architectural schools of important centres in the country. All these have consented to the proposed scheme, and the co-ordination of the work in the several schools is agreed upon. The importance of the advance thus accomplished can hardly be overstated."

The Certificate of the Board of Architectural Education.

"A certain definite standard and right method of architectural training being thus established, it follows that in due course the board's certificate will form a very valuable asset in the portfolio of the rising architect. However desirable it may be that the style and title of architect should be limited to duly qualified men, it does not seem possible for us to do more at present than undertake to certify that the men who pass through the board's curriculum and obtain the certificate are acquainted with the essentials of our art and possess certain definite qualifications. The test thus imposed will be a valuable one, not only in the interests of the public but also of the students themselves. The latter for the most part recognize their obligation to fit themselves for their work, but the natural impatience or perhaps conceit of youth leads some to think that for them at any rate there may be a short cut to success and fame, forgetting the old adage, 'There is no royal road to learning.'

"Then the question arises, Ought not those who have submitted to an arduous course of training and passed severe tests to be distinguished in some special manner? And this is now under consideration. In future those who possess a certificate of the Board of Education will certainly be exempted from some of the Institute examinations, though the final examination for membership, and that probably in a modified form, may be reserved; and we may, I think, be sure that the growing power of this Institute as the representative body will bring to its members, according to their grade, whether Fellow or Associate, not only increasing kudos but an ever-larger share of the greatest and best work that may be called for in our art.

An Architectural Primer for the Public.

"The education of the public in the elementary principles of architecture claims our attention at the present time. I know that this idea is regarded by some as Utopian, but at any rate there is abundant evidence that people generally take more interest in the subject than they used to. A committee was appointed last session to consider whether anything could be done in this direction, and they came to the conclusion that certain proposals laid before them were not only practicable but capable of an extensive application. A 'standard work' issued by the Institute, and directed not so much to the training of the professional student as to furnish information which might with advantage form a part of every educated person's intellectual equipment, would prove of use, not only to the public generally but also to school teachers and others interested in education.

"This question—The Education of the Public—together with that of a diploma for architects, and the best methods to be adopted in the laying-out of cities, will engage the attention of

The International Congress

which is arranged to meet in London in the third week of July next year. This will be the seventh such congress and the first held in London. On previous occasions, for the most part, the Congress has been aided by a State subvention; for foreign Governments are alive to the importance of such events from the point of view of the national interests. Our system of government not allowing of such support, we are thrown back, for the success of the Congress, almost entirely on our own enterprise and *esprit de corps*. An earnest appeal is therefore made to all members of the profession in this country to lend a generous aid in this matter, not so much by special donations—though the Executive Committee are by no means too proud to accept them—as by enrolling themselves members of the Congress, whether they see their way to taking part in it personally

or not. I anticipate that the International Congress will go far to open the eyes of the public to much in their own land that they have not hitherto valued at its true worth."

Street Architecture.

Referring to the question of our street architecture in its hygienic aspect, and the Traffic Commission, Mr. Belcher said that the formation of new main avenues and the widening of important thoroughfares to provide greater facilities for locomotion and transport implied new building frontages; and the façades which were thus to be in the public eye, as it were, for many long years to come ought to be under proper control from the very first. The owners of land bordering on a public thoroughfare ought not to be at liberty to indulge an ill-regulated fancy for what was bad and false in architecture or vulgar and showy in appearance.

In some countries—for instance, Germany and the United States—State interference had been invoked to regulate the "extension of cities," and he was glad to note that the authorities were seriously considering the advisability of similar legislation in respect of the suburbs of London. The attention of the public had been somewhat diverted from this larger subject to what was relatively a minor detail, namely, the character of the small villa residences; but the interest taken in the so-called "garden cities" was evidence of an awakening to the importance of a graduated increase of air-space in proportion as the buildings receded from the centre of the city.

He emphasized the view that the laying-out of such avenues and thoroughfares was not entirely and solely a matter for the engineer and borough surveyor. The architect, and in certain cases the painter and sculptor, might with great public advantage be called in to collaborate with them. It was not the best way in such a matter to take an Ordnance map and rule a straight line from one point to another. Yet such was, in essence, the course frequently adopted; and should any important building or object of interest come in the way, the engineer had little regard for it. There was a great deal more to be determined in connection with a new thoroughfare than the most direct route, the necessary gradients, the sanitary and hygienic requirements, &c.; there were artistic possibilities to be taken, as it were, into the public service, such as the opening up of suitable vistas, the bringing into prominence or the screening of existing buildings, the slight turning from the straight line to heighten the effect, or provide places for carriages to stand out of the line of traffic.

"In the absence of a Minister of Fine Art with duly qualified advisers, an Art Commission similar to that which has been established in New York has been suggested. The Commission referred to has jurisdiction over all designs of municipal buildings, bridges, approaches, gates, fences, lamps, the lines, grades and plotting of public ways and grounds, arches, structures and approaches, and other similar matters. It must be admitted that such powers as are here indicated can only safely be placed in the best and most capable hands.

"I believe, however, there is a better time coming. It is noteworthy as one passes through the country what an increasingly large proportion of the smaller class of houses have evidently been designed by architects. The builder is discovering that an architect's design is not an expensive and unnecessary luxury, but that the initial outlay is more than repaid, if not in the actual building of the house—and this often happens—at any rate in the improved letting which results. I cannot help remarking too upon the advantage which is certain to accrue to the architect himself in the process of studying and designing

small houses. It certainly is not very remunerative work, but it has its compensating rewards. Any real advance must no doubt begin in small things before there can be a true appreciation of greater work. As the true qualities of architecture should be equally seen in small as in large buildings, they may perhaps be more easily grasped and understood by way of the less complicated problems. Increasing knowledge will add to the number of those who appreciate and desire good work, and their sensitiveness in matters of taste will incite the producers to higher efforts, so that by action and reaction our native art will approach a higher level. Let us seek not merely to fan the growing interest in our art, but also to awaken a clear perception of its true qualities. It will not be long, I venture to prophesy, before public opinion will declare itself definitely and decidedly, insisting upon grace and refinement both in our public buildings and our important thoroughfares. Given such an opportunity, we may feel confident that our national architecture will not fail under the test, but will reflect the highest and noblest qualities of our race."

A vote of thanks to the president was moved by Sir John Thornycroft and seconded by Sir Arthur W. Rücker.

Trade and Craft.

Underlining for Roofs.

It is very necessary that there should be some protective covering underneath slates or tiles on a roof. Of course there are circumstances where not even boarding, or indeed pointing on the inside, is necessary, such as in the open roofs of cart-sheds and farm buildings, &c., but our present remarks are intended to apply to a roof where boarding is considered of importance. When this is used it is insufficient alone. There must be some damp-proof covering between the slates or tiles and the boarding, the reason being of course that the slates or tiles cannot be pointed on the underside so as to exclude moisture (it is obviously undesirable to bed them in mortar); and, as rain will drive up underneath and carry dirt with it, if there is no protection a roof will remain damp for a long time after wet weather, on account of the moist paste underneath the slates or tiles. Anyone who has had to deal with the repairing of a roof knows the horrid mess there is in such cases. Naturally if this moisture is allowed to penetrate, rotting must result. The only remedy is to use a waterproof covering. Now, whereas a lining paper may be very useful for an open roof where the tiles or slates are placed direct on the battens, without underboarding—because is a cheap method—it becomes illogical to do so (though, nevertheless often done) on a roof which is boarded, because in this latter case it is apparent that cheapness is not so much studied as efficiency. A roof which is intended to be covered in the best way needs to be protected against heat and cold, which boarding partially does. The ordinary lining paper is of little use in this respect; a much thicker and more non-conducting material is required, such as felt. The ordinary indurated bitumenized roofing felt is not sufficiently satisfactory. It is not particularly non-conducting, and if it is not efficient in this particular it loses its *raison d'être*. We have had our attention called, however, to a very good felt which has been placed on the market by Messrs. Engert & Rolfe, Ltd., of Poplar. This is a bitumenized hair-felt of special character, with very very considerable non-conducting properties. At the same time it is an extremely good sound-deadener, and will be found of considerable service in flooring and in partition work, to take the place of pugging.

NOTES ON VENTILATION.*

By F. ALDOUS.

A VERY great deal in the science of ventilation has been manufactured out of nothing—by that I mean theory. Theorists tell us this must be the case, or that another thing cannot be, because it is compatible with or contrary to given forces. No one will deny that there are natural laws which will assist ventilation, but to depend upon them, as many do, is simply ridiculous, and it is equally foolish to attempt to baffle natural forces.

Of the two general systems of ventilation, "natural or automatic" and mechanical, the former is usually (but not always) considered the most economical, and the latter the most effective.

To bring about the constant changing of the air, inlets as well as outlets are required to every room or compartment, and these appliances should be used with extreme care, otherwise it will soon be discovered that practice will in this case, as in most others, upset the theory laid down as to given laws.

Dealing with the outlet first, I fail to see how there can be such a thing unless it is absolutely proof against down-draught, as it cannot admit the cold air from the outside (which many so-called ventilators do, thus causing a down-draught) and at the same time extract the hot or vitiated air from the inside. All outlets, whatever form they may take, should be placed at the highest point of the place requiring relief; and too much dependence should not be placed upon the apparatus used.

There are very few automatic ventilators with any extracting power. The majority are not extractors, but intakes of wind and air except under very favourable circumstances. The apparatus used cannot be too simple in its construction so long as it is effective. It has been proved in many ways that a rotary cowl is no assistance to ventilation.

When applying fresh-air inlets great care should be taken as to the position in which they are placed, or they will have a destroying effect upon the extractor, or, maybe, a deleterious effect upon the occupants. They should be placed above the height of any person who may be standing near them and also below the lights. If placed above the lights from which the heat or vitiated air is thrown off, there will be the same effect as if air were coming into the extractor; for the cold air coming in above the hot air, or the heavier above the lighter, will cause the latter to fall instead of to rise and escape at the place where provision is made. By placing the inlets below the lights, or hot air, they will act as a help to the hot air in rising.

Changes of air can be brought about automatically if the appliances are correctly placed; but sometimes they are so placed that they have a direct contrary effect to that intended. Let me quote an instance. A short time ago my father and I were requested to test the ventilation at a Wesleyan chapel. We found the following conditions and results:—On the roof were three large ventilators as extractors (so-called). On the north side of the building were five Tobin tubes, and on the south five also. The wind was blowing from the south, at a velocity of from four to five miles per hour. On testing the inlets (or Tobin tubes) on the south side we found there was an inlet of fresh air of 6,000ft. per hour through each tube. We then tested those on the north side, which were sheltered from the wind, and found they were extracting at the rate of 4,000ft. per hour through each tube. Where the inlet or intake was, it was more of

a forced current than the bringing-in of fresh air, in the true sense of the word, because the wind was blowing directly into the collecting bonnets of the air tubes. Now, if the forced current is deducted from the natural inlet of fresh air—as it should be—these inlets, taking them as a whole, were perfectly useless: the reason being that the ventilators and inlets were not working together or helping each other, but quite the reverse, for the so-called exhaust ventilators were acting as inlets, thus bringing down volumes of cold air high above the Tobin tubes. The air thus brought in being more powerful than the air inside, caused a displacement of the existing air, and so forced it out at the inlets. It will thus be seen that inlet ventilators do not always act as inlets, and, therefore, care should be taken in applying them.

Again, when more than one inlet is used in the same room a great mistake is often made by not placing them at the same height; if they are not so placed one will act contrary to the other.

Another great mistake is made with respect to fresh air, and very frequently by architects. This is by such apparatuses as fans, punkahs, water-sprays or any other moving apparatus supposed to create air. The water-spray or fan simply displaces the surrounding air and on its amalgamation produces a cooling effect. That is all. Water-sprays or fans are of no assistance to ventilation in the way which ventilation should be brought about; neither by creating nor bringing in fresh air are they of any use.

No automatic apparatus placed in a room at a temperature of 50 degs. Fahr. can draw in the outside air of the same temperature; if such were the case it would entirely destroy the theory of spontaneous diffusion of two columns of air by their unequal density.

If a room is tested with fifty people in it the temperature will be found to be lowest at the floor line. To reduce the weight and increase the temperature, cold air should be brought in above it. This may appear strange, but it is so. If openings are made in the room 1ft. or 15ins. above the floor line to admit fresh air, and a thermometer is placed 1ft. above the floor line, the mercury will rise, even if the air admitted is colder than the general temperature of the room.

To deal with the carbonic acid gas, collecting bonnets should be placed under the floor; and connected with them should be tubes conducted up behind the stove; the ends which discharge the gas should be somewhat below the fire, so that the heat will destroy the acid, reduce it in weight, and so help it to rise and escape up the chimney flue. This is a way the heavy gas can be effectually dealt with, and it will also show how effectually a change of air can be brought about either by natural or mechanical means.

Of the lighter gas, sewer air is, of all others, the most dangerous, while still more deadly is carbonic oxide, though not nearly so dangerous or so much to be feared as either of the other two gases, inasmuch that there is always a warning with it—it being made by fire.

I am very sceptical about the ventilating powers of the ordinary types of fans. Let us look at some of their names—the air propeller, the cyclone, the blast, the hurricane, and various other names signifying their capabilities; but if they were called air churns it would be more appropriate; for displacing the existing air and causing a powerful wind is not changing the air, and unless the apparatus employed has a perfect and complete contact with the object it is required to move, the results aimed at cannot be attained. On the other hand, if the apparatus is applied and carried out scientifically, then mechanical ventilation can be made a success.

All the supplies to be moved, either as

intakes or outlets, must be connected to an accumulator or collector; and the accumulator to the fan or fans, and all parts being perfectly airtight, the contact is brought about, and thus it operates. Every space is full of air, and no more can come in until some is moved out.

THE SIXTH CAMPAIGN AT KNOSSOS.

Discovery of a "Little Palace."

IN the "Times" of October 31st is a long article by Dr. Arthur J. Evans recording the results of the sixth campaign of excavation on the site of the wonderful palace at Knossos, in Crete. The chief work of the year has been in tracing the paved Minoan Way leading from the palace to the hillside opposite. Here has been uncovered a "little palace" reproducing in its general style and arrangement the larger one to the east, and curiously repeating its history. Unfortunately it runs straight into the hillside at a considerable depth beneath an olive grove, and with the means at disposal it was possible to lay bare only its eastern section. A paved columnar court forms the approach to five spacious doorways of a large hall, divided by a second row of similar doorways—according to the Minoan system—into two sections. This hall was again flanked on its eastern side by another portico with column bases, so that we have an arrangement very similar to the Hall of the Double Axes in the domestic quarter of the palace. Adjoining was a small chamber recalling the bathrooms of the Cretan palaces, from the appearance of balustrades with column bases upon which wooden columns had originally stood. During the period of reoccupation, however, three of these had been backed and half their diameter embedded in a clay or rubble walling. So it came about that when, later, the wooden shafts themselves were destroyed by fire they left in the plaster of the wall behind them almost perfect casts of their embedded halves. A careful excavation of the chamber-wall thus brought out sufficient remains of these moulds of columns to illustrate what for the Minoan and "Mycenæan" architecture is a wholly new type. Columns of this period with the ordinary incave fluting—the prototype of the Doric—were already known, but in this case the fluting was in relief, a decoration obviously taken over from Egyptian columns imitating clustered papyrus stems or sheafs of reeds. The Nile is never very far off from Minoan Crete.

A new School at Bo'ness is about to be erected at a cost of £10,000. It will accommodate 1,000 children, in seventeen classrooms arranged around a central hall. The architects are Messrs. H. & D. Barclay, of Glasgow.

Linear Perspective Illustrated by Photography.—At the last meeting of the Glasgow Architectural Association Mr. Robert F. Sherar, a delegate from the Edinburgh Architectural Association, gave a lecture on linear perspective illustrated by photography. After hurriedly tracing the history of the subject from the conventional representations of the ancient Egyptians to the finished realism of the Middle Ages, he said that the researches of the science, as such, had been practically exhausted by Dr. Brook Taylor and successive writers in the eighteenth century, but it was always possible to improve on the methods of stating facts, and he thought that the illustration of perspective by photography would be something new. He then proceeded to show photographs of buildings taken from different points, illustrative of the angle of view, &c., and at the close of the lecture he presented to the Association's library a copy of his book "Perspective Tables" describing his methods.

* Extracts from a paper read before the Institute of Sanitary Engineers on October 18th last.

CARRON

XVIIIth Century FIREPLACES.

Carron Fireplaces appeal to those who appreciate elegance of design, beauty of finish, and fine workmanship. The above illustration shows No. 1 Suite, a handsome and imposing design suitable for Music or Drawing-Room.

CARRON COMPANY

(Incorporated by
Royal Charter, 1773).

CARRON, Stirlingshire.

Showrooms and Agencies:—LONDON (CITY AND WEST END), LIVERPOOL, MANCHESTER, BRISTOL, NEWCASTLE-ON-TYNE, GLASGOW, BIRMINGHAM, DUBLIN, AND SOUTHAMPTON.

Electrical Notes.

Relative Costs of Gas and Electricity for Lighting a Workhouse.—At last week's meeting of the Lanchester Board of Guardians the Building Committee presented a comparative statement compiled by the architects (Messrs. Newcombe & Sons, Newcastle) of the cost of lighting the workhouse, cottage homes and other buildings with gas and electricity. The cost of gas was estimated to be £500 a year and of electricity £173. The cost of the electric installation was put down at £1,725, while the necessary gas-piping, fittings, &c., would cost £350. The report was referred to the committee for further consideration.

Tests with Osmium Lamps.—Considerable experiment has been made in recent years in respect to new filaments for electric glow lamps, and among the rare earths tested osmium has been found to be very successful. It is therefore interesting to note some experiments carried out recently at the Vienna Technological Institute on the average life and power-consumption of lamps with these filaments. Six lamps of 35 volts and 16-c.p. and six lamps of 35 volts and 25-c.p. were tested. They were connected three and three in series, and the groups thus formed were placed on an alternating current circuit at 105 volts. The horizontal luminous intensity and the consumption were measured every 100 hours until the lamps were destroyed. The results obtained were as follows:—A lamp of 16-c.p. gave at first 15·1-c.p., with a consumption of 1·68 watts per candle-power. After 400 hours the luminous intensity increased to 17·3-c.p., and at the end of 2,100 hours fell again to 15·6-c.p. The consumption went down to 1·46 watts per candle-power, and then went up to 1·58 watts. Another lamp of 16-c.p. gave at first 15·2-c.p., then 17·5 after 400 hours, and 16 at the end of 2,200 hours. The average life of the lamps

was 2,200 hours, the limiting values being 1,793 and 3,036 hours. Among the lamps tested three alone presented a diminution in light of 10 per cent.—one after 1,750 hours, the other after 940 hours, and the third after 820 hours. In taking as a basis the lamp which diminishes 10 per cent. in luminous intensity, the average life is found to be 1,985 hours and the average power consumption 1·60 watts per candle-power for a lamp of 16-c.p. and 1·80 watts for a lamp of 25-c.p. The candle-power is given in terms of the Hefner candle, so that the power consumptions must be increased by 13 per cent. to correspond with British standard candles.

The L.C.C. Proposal to Supply Electricity in Bulk.—The newspapers have announced the fact that the London County Council proposes to bring forward a Bill to enable it to supply current in bulk—thus adding one more to its many undertakings. Our contemporary the "Electrical Review" observes that "some of the borough councils are also combining to promote a Bill of their very own for the same purpose; and of course the Administrative Co.'s Bill will come forward again. We may look forward, therefore, to a delightful 'three-cornered duel,' in which the L.C.C. and the company will fight the borough councils; the company and the borough councils will fight the L.C.C.; and the borough councils with the L.C.C. will fight the company. Could anything be more ludicrous—or pitiable? Truly municipalization in London has reached the extreme limit of absurdity and futility. . . . We prophesy a speedy triumph for the company."

A Lecture on Arc Lighting was given on October 17th by Mr. Frank Bailey, M.I.C.E., at the Electrical Exhibition at Olympia. Reference was first made to the discovery of the electric arc a hundred years ago by Sir Humphry Davy, after which various histori-

cal lamps were mentioned, the Rapiëff lamp (1877) being cited as containing many of the leading features of the lamp of to-day. Flame lamps were discussed. Nearly fifty years ago Harrison used a combination of carbon and metallic salts, and twenty years later (in 1879) Hamel described hollow cylindrical carbons, which appear to have been the forerunner of the modern cored carbons. The lecturer said that multi-coloured carbons could now be made so as to indicate the time of night, white being suggested as a convenient colour up to 8 p.m., yellow until midnight, and red for an hour afterwards. Mr. Bailey then proceeded to institute comparisons between lighting by gas and electricity, to the benefit of the latter.

Coming Events.

Monday, November 13.

SURVEYORS' INSTITUTION.—General Meeting at 8 p.m.

Tuesday, November 14.

MANCHESTER SOCIETY OF ARCHITECTS.—Mr. B. Pendleton on "Two Great Cistercian Abbeys of Yorkshire," at 6.30 p.m.

Wednesday, November 15.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS.—Excursion to Dawdon Colliery.

Thursday, November 16.

CARPENTERS' COMPANY.—Mr. James Bartlett on "Setting-out Work for Acts of Parliament and By-laws," Carpenters' Hall, London Wall, at 7.30 p.m.
SOCIETY OF ARCHITECTS.—First Ordinary General Meeting at 8 p.m.

Friday, November 17.

INSTITUTION OF MECHANICAL ENGINEERS.—Meeting at 8 p.m.
BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Mr. R. Catterson-Smith on "Ornamental Design and how it should be taught," at 6.45 p.m.
ARCHITECTURAL ASSOCIATION.—Mr. J. A. Gotch on "Old Manor Houses," at 7.30 p.m.

Saturday, November 18.

JUNIOR INSTITUTION OF ENGINEERS.—Visit to Messrs. Barclay, Perkins & Co.'s Anchor brewery, Park Street, Southwark Bridge, at 2.30 p.m.

The Edison & Swan United Electric Light Company, Limited,

36 & 37, QUEEN STREET, CHEAPSIDE, LONDON, E.C.

And at Birmingham, Belfast, Cardiff, Dublin, Dundee, Glasgow, Hull, Leeds, Liverpool, Manchester, Newcastle-on-Tyne, Sydney, N.S.W.

List of Competitions Open.

DATE OF DELIVERY.	DESIGNS REQUIRED.	AMOUNT OF PREMIUM.*	DEPOSIT REQUIRED FOR CONDITIONS, &c.*	FROM WHOM PARTICULARS MAY BE OBTAINED.
1906.				
Jan. 15	Hackney—Library	50, 30 and 20 guineas	£1 is.	W. A. Williams, Town Clerk, Town Hall, Hackney.

* Where a dash is given it does not necessarily mean that no premiums are offered and no deposit is required, but that we have not been informed what these are (if any).

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

ARCHITECT and SURVEYOR'S JUNIOR ASSISTANT (21) seeks situation. London office. Good draughtsman. Detail and small scale drawings. 4 years' general experience. Good references. Moderate salary.—R. F. D., 4, Buckland House, Oford Rd., N. 1451

ARCHITECT'S ASSISTANT (24) DIS-ENGAGED. Working drawings, all details, surveying, assist with quantities; experienced; excellent references.—Box 1441, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT (25) DIS-ENGAGED. Nine years' experience. Good draughtsman, designs, working drawings, details, etc. London or country.—W. A. N., 46, St. Augustine's Road, Camden Square, N.W. 1442

ARCHITECT'S ASSISTANT (25) Disengaged. Ten years' experience; working drawings, details, surveying, supervision, assist with quantities; excellent references.—A. C., 37, Hardman Road, Kingston-on-Thames.

ARCHITECT'S ASSISTANT (20) desires ENGAGEMENT; working drawings, details, surveying, assist with quantities; experienced; excellent references.—Box 1474, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT and QUANTITY SURVEYOR'S ASSISTANT (23) desires engagement; working drawings, abstracting and billing, surveying, &c. Provincial and London experience.—Box 1473, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT and SURVEYOR'S ASSISTANT desires engagement. Ten years' practical experience in all branches of the profession.—Apply to S. H., 25, Palace Square, Upper Norwood, S.E. 1481

ARCHITECT'S CHIEF ASSISTANT (30), twelve and a half years' experience, desires ENGAGEMENT in good office. Managership preferred. Thoroughly competent. Five and a half years with noted London architect. Excellent references. Disengaged shortly.—Box 1461, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S COMPETENT JUNIOR seeks engagement, good general experience, excellent reference from well-known architects. Salary 25s.—DONCASTER, 1, Wells Road, Shepherd's Bush, W. 1421

ARCHITECT (26) with several years' provincial and London experience desires ENGAGEMENT as Assistant. Good all-round man.—G., "The Poplars," Collyweston, Stamford. 1440

ARCHITECTS.—Well-educated Youth (18) seeks JUNIOR POSITION. Good draughtsman and tracer. Moderate salary.—Address, ADVERTISEMENT, 91, Tollington Park, N. 1431

ARCHITECT'S JUNIOR ASSISTANT desires engagement in or near London. Accurate draughtsman and tracer; excellent knowledge of construction and quantities. Good references.—A. G. O., 117, Brighton Road, Croydon. 1423

ARCHITECT'S JUNIOR ASSISTANT seeks ENGAGEMENT; whole or part time; 5 years' experience. Good draughtsman, tracer, &c.—A. S., 119, Finsbury Pavement, E.C. 1482

ARCHITECT and SURVEYOR'S JUNIOR ASSISTANT requires situation in Architect or Builder's office. Four years' experience; good draughtsman, tracer, &c. Moderate salary.—A. C. W., "Owlscot," Purley, Surrey. 1425

BUILDERS' CLERK. Re-appointment; 25 years' experience in the West-end trade, and possessing general knowledge of same. Trustworthy; first-class references. Salary moderate.—G. B., 55, Lavender Sweep, Lavender Hill, S.W. 1443

CARPENTER, JOINER, STAIRHAND; PLASTERER, clean workman; piece or day; abstainers; town or country.—A. E., 84, Cambourne Road, Southfield, Wandsworth. 1432

CLERK OF WORKS desires EMPLOYMENT. Many years Government Service. Any district, but Essex preferred; good references.—W. LUMSDEN, "Woodside," Southminster. 1459

CLERK (24) seeks situation in Builders or Estate Agent's Office. Eight years' general office experience; moderate salary; good references.—Wood, 4, Market Place, North Ormesby, Middlesbrough. 1477

GENERAL FOREMAN seeks ENGAGEMENT; long and varied experience; energetic and reliable.—Box 1479, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

GENERAL FOREMAN BRICKLAYER at liberty. Town or country. Thoroughly competent. Five years last (London) employer, to whom references permitted. Good disciplinarian, timekeeper, &c.—G. L., 58, Rosslyn Crescent, Wealdstone. 1426

GENERAL or WORKING FOREMAN (Carpenter); town or country; practical experience all branches, building, alterations, or good jobbing; wages moderate.—A. WEBBER, 29, Pollock Road, Walworth, S.E. 1456

PAPERHANGER, good, wants piecework. Distance no object.—C. MARKHAM, 11, Great Sutton Street, Clerkenwell, E.C.

PLUMBER and ELECTRICIAN (practical workman) wants Situation. Good references. Age 28. Any distance, or abroad. Wages moderate for comfortable shop.—PLUMBER, 1, Queen's Road, Penkhull, Stoke-on-Trent. 1439

PLUMBER, reliable, wants JOB. Well up in sanitary work and lead-laying; wages moderate, or would take piece-work labour and solder only; good reference; age 31.—A. SMITH, 7, Ludwick Road, New Cross, S.E. 1457

QUANTITIES.—Surveyor, with London office, prepares Quantities, Estimates, Variations, &c. Terms by arrangement.—Box 1468, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

SHOP FOREMAN OF JOINERS seeks RE-ENGAGEMENT. Thoroughly capable and accurate setter out. Total abstainer. Refs.—Box 1449, BUILDERS' JOURNAL Office, 6, Great New Street, E.C.

TO LONDON ARCHITECTS.—Advertiser (23) desires change into London office (temporary or permanent); eight years' varied provincial experience in several offices. Prize winner for measured drawings, construction and quantities; 25s. to commence.—Box 1448, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

YOUNG MAN requires ENGAGEMENT as BUILDER'S ASSISTANT, having an excellent all-round home and colonial experience. Abstainer; best references.—Apply, Rookfield, Muswell Hill, London, N. 1413

Appointments Vacant.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

BITUMEN DAMP COURSE. AGENTS WANTED throughout Great Britain for the Sale of Genuine Trinidad Bitumen Damp Course. Superior in quality and low in price. Liberal commission.—Apply W. W. BAMFORD, Ltd., Deep Water Pier, Northfleet.

FIGURE GLASS PAINTER WANTED.—Young man preferred, state wages expected; experience.—Apply by letter EMPLOYERS' ASSOCIATION, 18, Victoria Street, Toronto, Canada.

REPRESENTATIVE WANTED, who thoroughly understands the best class of Metal work and Electric Light Fittings. Must have good connection with the leading Architects and Electrical houses. This is an exceptional opportunity for a suitable man.—Apply, stating age, district, experience, and terms, to J. W. SINGER & SONS, Frome.

SAWING and PLANING MILL.—Wanted an experienced man to control and supervise wood-working mill with the object of increasing the output.—Apply Box 1666, c/o Dixon's, 195, Oxford Street, London, W.

Drawings, Tracings &c.

AN ARCHITECT has time to ASSIST others with working drawings, details, tracings, and perspectives at own office or otherwise. Good general experience. Special terms for competitions.—Apply H. L. FEDDEN, 11, Hart Street, Bloomsbury. 1411

ARCHITECT, fourteen years' good experience, renders competent assistance in design, drawings, perspectives, or competition work at own office.—Box 1467, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

DRAIN PLANS PREPARED.—JOHN LAWRENCE, Jun., M.R.S.I., A.I.S.E., 112, Shirland Road, W.

HOSPITALS and SCHOOLS.—EXPERT ASSISTANCE offered on designs. Placed 1st and 2nd in Competitions for Buildings to cost over £223,000.—G. B., "Woodlands," Ryde, I.W. 1460

PLANS and SPECIFICATIONS prepared for flats or residences, and property measured and planned. Terms can be arranged to suit clients.—C. M. P., 53, Coldharbour Lane, Camberwell, S.E. 1461

QUANTITY SURVEYOR.—Quantities prepared, variations measured, &c., by experienced quantity surveyor. Terms by arrangement.—Box 1315, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

SCHOOLS, HOSPITALS and LIBRARIES.—Assistance given by Scotch Expert. Speculative terms for competitions.—Box 1438, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, London, E.C.

YOUNG ARCHITECT and SURVEYOR desires to assist during his spare time in the preparation of Contract or Competition Drawings. Surveys made. Ten years London experience.—E. C., 100, Archway Road, N. 1437

Businesses Wanted & For Sale

BUILDERS' and DECORATORS' BUSINESS for DISPOSAL, about 30 miles from London, in small town. First-class Premises with House adjoining.—Apply Box 1452, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Partnerships.

ARCHITECT wishes to meet another to share office, with view to future partnership. Good designer and with connection essential.—Apply Box 1480, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Miscellaneous.

ALFRED S. TUCKER'S ALABASTER AND MARBLE WORKS, 143½, Euston Road, N.W. Telephone: 2955 Central.

CAPITAL REQUIRED for the development of well-known patent system of building. A business is already established.—Apply Box 1471, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ESTIMATING FOR DILAPIDATIONS. A few practical lessons (afternoon) required.—Address "London," Box 1450, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

FOR SALE, cheap. A large quantity of BLOCKS and SAWN DERBYSHIRE STONE from Matlock, Darley Dale, and Stanton Quarries. Also BLUE and BROWN YORK.—Apply, J. HODSON & SON, Ltd., Stone Merchants, Nottingham.

FOR SALE. Fire-proof Impregnable Safe Door, 6 ft. by 2 ft. 6 in. by 4½ in. thick. Four bolts and frame complete. By Whitfield, Birmingham. As good as new.—Apply to RAWLANCE & SQUARBY Digby Estate Office, Sherborne.

"GRANDMASTER."—Grove Flanged Draught Chimney Pot. The Noiseless and most efficient Smoke Conductor.—PARKINSON, Greenhill Road, Armley, Leeds; STIDDER & Co., Agent for London. Chief Offices and Showrooms: 16, Percy Street, Tottenham Court Road, W.

MARBLE AND GRANITE WORK. Speciality, Shopfittings, Steps, and Monuments.—KELLY & Co., Masons, Mill Hill, N.W., also Kilburn N.W., and Harpenden, &c. Telephone, 1159 Hampstead.

OFFERS WANTED for last 250 numbers BUILDERS' JOURNAL.—Box L.M., BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

POLING BOARDS, selected lengths and thicknesses (best quality and full measure). Also Scaffold Boards, Putlogs, Scantlings, Deals, Battens, and Boards. Lowest wharf prices. C. H. GLOVER & Co., Ltd., Importers, Hatcham Saw Mills, Old Kent Road, S.E.

TO CONTRACTORS and MANUFACTURING WORKS. Portable Electric Winches and Hoists with Motors attached, and Electrical Systems of transporting goods.—Apply to TILSTONE DUDGEON, Ewell, Surrey.

F. B. HOLLIS, Hon. Sec.,
October, 1905. 17, Bedford Row, London, W.C.

Property & Land Sales.

To Contractors, Motor-car Engineers, and others.

MESSRS. LINNETT & LANE will SELL by AUCTION, at the MART, E.C., on FRIDAY, NOVEMBER 10th, 1905, at TWO o'clock, the following FREEHOLD and LEASEHOLD PROPERTIES:—

KILBURN.—Extensive and valuable BLOCK of FREEHOLD STABLING PREMISES, situated in Pembroke Mews, comprising seventy-six stalls, spacious loft, harness-room, and paved yard approached by double entrance gates, the whole property having an area of about 6,550 super feet, and also the adjoining long LEASEHOLD STABLING PREMISES, comprising four-stall stable with loft, double gateway entrance, and paved yard (the whole is let to the Victoria Omnibus Company at £330 per annum, the tenants paying rates and taxes); and also the substantial ally-built DWELLING-HOUSE, No. 69, Granville Road, adjoining the above property, and let at £33 per annum the tenant paying rates and taxes. Held by lease, together with the last-mentioned property. Unexpired term about fifty-seven years, ground rent £8 10s. per annum.

Particulars of the Solicitors, Messrs. THOMAS FRAME & SON, 37 and 39, Essex Street, Strand, W.C., and of the AUCTIONEERS, 62, 64 and 66, Station Road, Willesden Junction. Telephone No. 41, Harlesden.

To Builders and Land Speculators. — FREEHOLD MANSION, with upwards of an acre of ground. Free from restrictions.

SYDENHAM.—No. 42, NEWLANDS PARK — Large FREEHOLD MANSION, with coach-house and stabling, greenhouses, pit lights, gardeners' sheds, &c. With a frontage of about 420 ft. to existing roads, and thoroughly ripe for immediate development as a building estate and the creation of ground rents. The mansion is adaptable for conversion into good-class flats or eligible for a public institution. Adjoining recreation grounds and close to two stations.

MR. GEO. PRATT, F.A.I., will SELL the above by AUCTION, at the MART, Tokenhouse Yard, London, E.C., on WEDNESDAY, NOVEMBER 8th, at TWO o'clock.

Particulars, plans, and conditions of Sale of the Solicitors, Messrs. POCOCK & GODDARD, 3, South Square, Gray's Inn, W.C., and of the AUCTIONEER, Railway Approach, Sydenham, S.E.

Contracts Open.

BOROUGH of BROMLEY.

MUNICIPAL BUILDINGS, &c.
The Council of the Borough of Bromley is prepared to receive TENDERS for the ERECTION of MUNICIPAL BUILDINGS, &c., in Tweedy Road, Bromley, in accordance with drawings and specification prepared by Mr. R. FRANK ATKINSON, F.R.I.B.A., of 8, Sackville Street, W., which, together with draft Contract and conditions, may be seen at his Office, or at the Office of the Quantity Surveyor, Mr. SAMUEL A. STANGER, F.S.I., 21, Finsbury Pavement, E.C.

Bills of quantities and form of Tender will be furnished on application being made to me not later than the 7th of November next, accompanied by a £5 Bank of England Note, which will be returned on the receipt of a bona fide Tender.

Tenders, endorsed "Tender for Municipal Buildings," to be delivered to me as under not later than MONDAY, the 27th day of NOVEMBER 1905.

The Council does not bind itself to accept the lowest or any Tender.

FRED H. NORMAN,
Municipal Offices, Town Clerk.
Bromley, Kent,
25th October, 1905.

COUNTY BOROUGH OF CROYDON. STROUD GREEN WELL—CONTRACT No. 2. TO EXCAVATORS AND BUILDERS.

Notice is hereby given, that the Council are prepared to receive TENDERS for the EXCAVATING, CONCRETE, and BRICKWORK necessary in the Foundations of the Engine Room at the Stroud Green Well.

Plans can be seen, and Specifications, Bills of Quantities, and Form of Tender obtained at the Office of Mr. GEORGE F. CARTER, A.M.Inst.C.E., Borough Engineer, Town Hall, Croydon, upon payment of a deposit of £1 1s., which will be returned upon receipt of a bona fide Tender.

Tenders to be sent to me by ELEVEN o'clock in the Forenoon on TUESDAY, the 14th NOVEMBER, 1905, endorsed "Stroud Green Well—Contract No. 2."

Tenders will only be received subject to the terms of the Draft Contract, which has been deposited at the Office of the Borough Engineer aforesaid, and may be inspected during office hours.

The Council will not be bound to accept the lowest or any Tender.

F. C. LLOYD, Town Clerk.
Town Hall, Croydon,
2nd Nov., 1905.

GLoucester EDUCATION COMMITTEE.

TO BUILDERS AND CONTRACTORS.

Builders desirous of TENDERING for the ERECTION of COUNCIL SCHOOLS in Derby Road, Gloucester, are requested to send their names to the Architect, Mr. J. Fletcher Trew, M.S.A., County Chambers, Station Road, Gloucester, not later than the 1st NOVEMBER next, between the hours of Ten and Five, at whose office the plans and specifications may be seen.

Bills of quantities may be obtained from Messrs. Vale & Kingsford, George Street, Gloucester, on deposit of £5 note, which will be returned on receipt of a bona fide Tender with the return of all papers supplied.

Sealed Tenders are to be sent in to the undersigned not later than NOON on TUESDAY, NOVEMBER 8th next, endorsed "Tender for Derby Road Council Schools, Gloucester."

The Committee do not bind themselves to accept the lowest or any Tender.

P. BARRETT COOKE, Secretary,
5, Berkeley Street, City of Gloucester Education
Gloucester. Committee.

- 1482.—ARCHITECT'S JUNIOR ASSISTANT; 5 yrs. exp. good draughtsman, tracer, whole or part time.

See p. xx for the Employment Register.

OUR METHOD

OF ADVERTISING

A "WANT"

not only brings results, but it saves you expense.

We give three insertions of an advertisement for the price of two, and in addition we tabulate the particulars you send under a special heading in the Employment Register, and keep it there for *six weeks* free of any extra charge.

Thus for 3s. a four line advertisement appears in two places in our paper, and your "want" is advertised for six weeks.

We know this is generous treatment, but we think when a man is out of a situation it is a time when a little generosity is appreciated. The letters we have already received from those who have taken advantage of this scheme point clearly to the truth of this, and we are glad to know that the Employment Register has already helped many to find good positions.

The only condition we make is that immediately an appointment is obtained we are advised in order that we may take the number and name off the Register, thus saving waste of space.

All advertisements for next week must reach this office not later than 5 o'clock on Monday, the 13th inst.

The Employment Register in this number appears on page xx.

The Three Builders' Journal Insurance Schemes are—

- (1) A Free Accident Insurance of £500.
- (2) An Accident Insurance of £500.

And also

£250 for Permanent Total Disablement.
£2 10s. per week for Temporary Total Disablement.

Premium, 1/-

(For the conditions under which policies Nos. 1 and 2 are issued readers should refer to our pamphlet, sent on application.)

- (3) An Accident Insurance of £1,000,
£500 for Permanent Total Disablement,
£6 per week for Temporary Total Disablement,
with special advantages.

Write for our Insurance Pamphlet to—

 * Recommended for acceptance. [Rest of London.]

Electrical Manufacture of Rivets.—Messrs. Macfarlane & Whitfield, of Dunston, have just had completed by Messrs. Bruce Peebles & Co., Ltd., an electrical installation for the manufacture of rivets.

A steel Suspension Bridge over the Mersey at Warrington is to be erected by Messrs. T. Piggott & Co., of Birmingham. The bridge will have a span of between 200ft. and 300ft., and a clear headway of about 80ft. It will be built from plans drawn up under the supervision of the company's chief designing engineer, Mr. E. A. Candy, which were awarded the premium of £25 offered in competition. More than 100 designs were submitted. The work is to be finished next year, and will be inspected by the American Association of Engineers on their visit to this country in the early part of the summer.

THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

November 15, 1905. Vol. 22, No. 562.

6, Great New Street, Fetter Lane, E.C.

Summary.

Some tests which have been made at Chicago serve to show that in sand for mortars and cements, clay in limited quantities, say not more than 12 per cent., is beneficial. The best mortar sand is one with sharp corners, rough surfaces, and grains neither all coarse, all medium nor all fine, but with the proper mixture of these sized particles. The sand also need not be washed. (Page 285.)

The Co-Partnership Tenants' Housing Council exists, not as a commercial body, but to promote the laying-out of new housing estates so as to provide open spaces—two gardens being allotted to each house. Societies on this basis are established at Ealing, Sevenoaks and Garden City, and are in contemplation for Birmingham, Bournville, Berkhamsted and Manchester. (Page 287.)

The foundations of Liverpool Cathedral are expected to be completed by March 1st next, when the building of the cathedral proper will be commenced. (Page 284.)

The Dean and Chapter of Winchester Cathedral have now received the reports of Mr. Colson, Mr. T. G. Jackson and Mr. Francis Fox, who confirm the statements about the dangerous condition of the building. The mischief is most serious in the south wall of the presbytery, the settlement being attributed partly to insufficient buttressing of the vaulting and partly to the untrustworthy foundations. (Page 288.)

An account of the various new Government buildings in progress in different parts of London is given on page 288.

Ingram House, Stockwell, the first of its kind erected by a company formed for the purpose of providing residential clubs for young men, has now been completed. The plan is that of a St. Andrew's cross. Accommodation in the main building is provided for 208 residents, with staff in addition. (Page 283.)

In the concluding article dealing with new theories of architecture Mr. Claude Bragdon elaborates a theory called that of *Yo* and *In*, these being the Japanese terms for things masculine and feminine. *Yo* is intended to designate that which is simple, direct, primary; *In* that which is complex, indirect and passive. The expression of these terms is shown throughout all styles of architecture. (Page 276.)

The next Arts and Crafts Exhibition will probably be opened on January 15th next at the Grafton Gallery. (Page 284.)

Why not Office Towers?

WHY not build office towers? The American skyscraper, of course, becomes practically a tower, more especially as regards the portion above surrounding buildings, but the office tower we now suggest is quite a different structure, one planned with the special purpose of securing abundance of light and air to the rooms. That is not the case with the skyscraper, because right in the midst of the structure there may be rooms as gloomy and ill-ventilated as any in city basements: and it is just that evil which needs to be got rid of in office buildings. City life necessarily means congestion. Buildings are packed together as tight as possible, so that landlords can get the utmost revenue from every scrap of space. But for the present there is no tax on the air, and as a consequence on costly sites great pillars of rooms are built to meet the needs, just as in housing there is one method of spreading the people out thin in little houses (as in suburban and country districts), and another method of piling them on top of one another (as in city tenements). Both methods are the outcome of conditions, but there can be no doubt which is the better. The curse of the tenement is the want of light and air: and the same curse belongs to modern office buildings. Men and women are compelled to spend most of their lives in rooms so placed that they secure neither sunlight nor free air without a draught. We suggest, therefore, the office tower as a solution. It could be planned in several ways. For example, it might consist of a series of rooms arranged one above the other inside the tower, with stairs and lifts in projections at the angles; or the stairs and lifts might be arranged in the centre with an office on either side; or four towers, each with a room on every floor, might be grouped around a stairs and lift block in the centre. But whatever the arrangement, the particular object to be secured is abundance of light and air. In the case of the tower with single rooms one above the other there could be a window on each face, so that according to the direction of the wind such openings could be closed or opened so as to secure "the open window" without draught; and the same could be done with the other suggested arrangements. Of light of course there would be abundance, more especially at the heights above adjoining buildings—and there is no reason why these towers could not be carried 300ft. high—which is about the

height of the campanile of the new cathedral at Westminster. Of their architectural appearance in a city there is much to be said, but we cite only the beautiful tower of the town hall at Verona as an example of the splendid effect obtainable; while as to fire, each room could be rendered fire-resisting and a fire even allowed to burn itself out there without danger to those above or below. A city of spires we already know, but a city of office towers is a suggestion of what might be, and may perhaps be.

The Architect's Position in regard to Machinery.

ARCHITECTS nowadays are called upon to accommodate a good deal of machinery in buildings. Certain classes of buildings, in fact, are designed primarily to house machinery, such as boiler-houses, engine-houses, electric-light stations, &c., saw-mills, printing works, and factories of all kinds. Where the form of building is determined by the machinery the work has got into the hands of specialists who know enough not to make the many foolish mistakes that are so commonly found in architects' plans when machinery is concerned. It is remarkable that the architectural profession has not given more attention to the subject by having papers read before the societies, dealing with different classes of machinery. The many firms who install this necessary portion of the equipment of modern buildings cite instances where they have been hampered by the ignorance of architects who have omitted to consider machinery in any way, having simply provided a room of any shape or size that happened to be convenient. Any hole or corner was considered suitable, and the engineers were left to get over their troubles as best they could. Everyone has heard of the mouldings that come in the way of steam pipes, necessitating bends which cause loss of efficiency; the partition walls and piers which prevent boilers or engines being placed in proper relation to each other; and the usual cutting away. How frequently, for instance, have floors to be cut to allow for lifts?—even if a hole is provided it is only the size of the cage, and all the paraphernalia is forgotten. It should be a necessary part of a student's training in architecture to go through a course of lectures on the elements of machinery. It need not be very deep, but just sufficient to let the architect realize when he should consult with the engineer-specialist in the preparation of a design.

THE LAW OF CONSONANCE REPETITION & VARIATION

CHATEAU MAUMONT—THE CENTRAL PAVILION WITH ITS TWO TOWERS ECHOES THE ENTIRE FAÇADE WITH ITS TWO TOWERS

Laws of Beauty.

Three is pre-eminently the number of architecture. The division of a composition into three related parts is so universal that it would seem to be the result of an instinctive effort of the human mind. The twin pylons of an Egyptian temple, with the entrance between, for a third division, correspond to the two towers of a Gothic cathedral and the intervening screen wall of the nave. In the palaces of the Renaissance a threefold division, obtained vertically by means of quoins or pilasters and horizontally by means of string-courses, was very common,

as was also the division into a principal and two subordinate masses. The orders are divided threefold into pedestal or stylobate, column and entablature; and each is again divided, the first into plinth, dado and cornice; the second into base, shaft and capital; and the third into architrave, frieze and cornice.

In nature a thing is echoed or repeated in all its parts, and such recurrences, such inner consonances, are common in architecture also. The channelled triglyphs of a Grecian Doric frieze echo the fluted columns below. The balustrade which crowns a colonnade is a repetition, in some sort, of the colonnade itself. The modillions of a Corinthian cornice are altered and elaborated dentils. Each pinnacle of a Gothic cathedral is a little tower with its spire.

Ruskin says: "All good Gothic is nothing more than the development . . . of the group formed by the pointed arch for the bearing line below and the gable for the protecting line above . . ." In classic architecture it is the column and entablature which constantly recurs.

This law of consonance is more obscurely present in architecture in the form of recurring numbers—identical geometrical figures, parallel diagonals, &c. It has to do also with the style and scale of a building—the adherence to substantially one

method of construction and one manner of ornament throughout, just as in music the key, or chosen series of notes, may not be departed from except through proper modulations.

Another principle of natural beauty which finds frequent illustration in architecture, particularly in Byzantine and Gothic work, is that of diversity in monotony, a perceptible and piquant difference between the individual units belonging to a single type or species. The metopes of the Parthenon frieze, seen at a distance, must have appeared very much like one another, yet each is a separate work of art. So also are the capitals to the columns of the beautiful sea arcade of the Venetian Ducal palace; unlike in contour, they differ widely in detail and unfold a Bible story. In Gothic cathedrals and monastery cloisters a teeming variety of invention is hidden beneath apparent uniformity. The gargoyles of Notre Dame make similar silhouettes against the sky; but seen near at hand, what a menagerie of monsters! The mediæval builders of Italian churches varied the sizes of the arches in the same arcade; and that this was an effect of art, and not due to accident or carelessness, Ruskin long ago discovered, and the more recent Brooklyn Institute surveys under Professor Goodyear have amply confirmed his view.

Another law is that of rhythmic diminution. There is in nature and art a universal tendency towards refinement and compactness of form in space, or contrarywise towards increment and diffusion. Its operation may be traced in the widening circles which appear when still water is disturbed, in the diminishing spirals of a shell, in the branching of a tree and the veinings of a leaf, no less than in the decreasing sizes of the pipes of an organ or in the spacing of the frets of a guitar. The entasis of a column is determined by this law; the spiral of an Ionic volute and the annulets of the Parthenon caps variously illustrate it. In the recognition of this principle a building is often made to grow lighter and finer from the ground upwards: an end attained by various devices—in the Riccardi palace by diminishing the rustication of the ashlar in successive storeys; in the Farnese by reducing the sizes of the angle quoins; in an Egyptian pylon by simply battering the wall; and in a Gothic cathedral by a kind of segregation not unlike that to which a tree is subjected—the strong, plain base corresponding to the trunk, and the multitude of delicate pinnacles and crockets to the outermost twigs and branches.

The Arithmetic of Beauty.

Although architecture is based primarily upon geometry, it is possible to express all spatial relations numerically, for arithmetic and not geometry is the universal science of quantity. It is true that the trained eye and not an arithmetical formula determines what is and what is not beautiful proportion: nevertheless the fact that the eye instinctively rejects certain proportions as unpleasing and accepts others as satisfactory is an indication of the existence of laws of number not unlike those which govern musical harmony.

THE BROLETTA AT MANTUA

PALAZZO UGUCCIONI AT FLORENCE

PALAZZO BARTOLINI, FLORENCE

PALAZZO TACCONI, BOLOGNA

VARIOUS PALACE FAÇADES—3 USED AS A MULTIPLE

Numbers, advancing towards infinity singly and in groups (expressed by the multiplication table), at certain stages of their progression come into relation with one another. For example, an important conjunction occurs in 12; for of a series of twos it is the sixth, of threes the fourth, of fours the third, and of sixes the second. It stands to 8 in the ratio of 3:2 and to 9 of 4:3. It is related to 7 through being the product of 3 and 4, of which numbers 7 is the sum. 11 and 13 are not conjunctive numbers. 14 is so in the series of twos, fours and sevens; 15 is so in the series of fives and threes. The next conjunction of 3 and 4 and their first multiples after 12 is in 24, and the next following in 36, which numbers are respectively the two and three of a series of twelves, each end being but a new beginning.

The fact that a series of threes and a series of fours mutually conjoin in 12 finds an architectural expression in the Tuscan, the Doric and the Ionic orders according to Vignola, for in them all the stylobate is 4 parts, the entablature 3, and the intermediate column 12. The affinity between 4 and 7, revealed in the fact that they express the ratio between the base and the altitude of a right-angled triangle of 60 degs., and the musical interval of the diminished seventh, is architecturally suggested in the Gothic chapels of Windsor and Oxford, whose widths and lengths are in the proportion of 4 to 7, and it finds complete

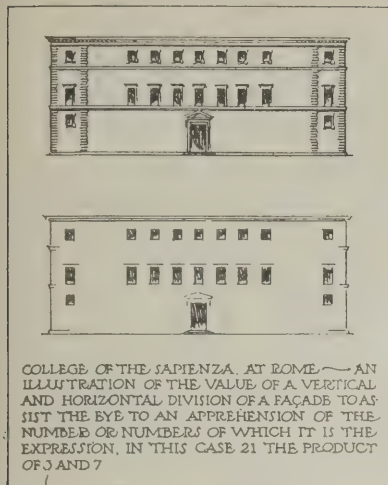

EPISCOPAL PALACE AT LEON, 7 AS 3 AND 4

PALACE IN VICENZA

PALACE IN ROME, 8 AS 3 AND 5

objective expression in the Palazzo Giraud, which is four storeys in height with seven openings in each storey.

The tracery of Gothic rose-windows forms perhaps the highest and finest architectural expression of number. Sometimes, as in the case of the Venetian ducal palace, the numbers involved are too great for counting, but other and different truths of number are celebrated; for example, the multiplication of the first arcade by 2 in the second, and this by 3 in the cusped arches and by 4 in the quatrefoils above them.

Seven is proverbially the perfect number. As a centre with two equal sides it is possessed of symmetry, and as the sum of an odd and even number (3 and 4) it has vitality and variety. All these properties a work of architecture can variously reveal. Fifteen also is a number of great perfection.

In conclusion, it is perhaps well that the reader be reminded that these are the byways and not the highways of architecture into which he has been led—that the highest beauty comes always, not from beautiful numbers nor from likenesses to Nature's

eternal patterns of the world, but from utility, fitness, economy and the perfect adaptation of means to ends. This truth is usually exploited in the literature of architecture to the exclusion, it has seemed to the writer, of every other. and these essays have been attempted in the hope of being able to show that along with this truth there goes another: that in every good work of architecture, in addition to its obvious and individual beauty, there dwells an esoteric and universal beauty, and that by taking more thought of this beauty we may learn to build more worthily.

NOTES ON COMPETITIONS.

Some Explanation of the Hove Affair.

THE dissatisfaction felt by competitors at the result of the recent competition for a proposed public free library at Hove, which has found vent in a flood of correspondence to the professional journals, was based upon an apparently very legitimate cause, namely, the refusal of the assessor (Mr. Belcher) to make an award and the consequent inability of the promoters to award the premiums. It is now possible to give some explanation of what up to the present has seemed such an extraordinary decision, but one cannot help feeling that it is a thousand pities that the assessor could not have seen his way to enlighten the minds of competitors upon the subject, whereby the temper of these often-sorely-tried individuals might have been sweetened and the general indignation of all interested in such affairs brought to a timely end. A recapitulation of the events which have preceded the present issue may not come as ancient history to many.

The competition was advertised and the conditions were applied for in the ordinary course, but it was found that no assessor had been engaged, in consequence of which many architects refused to compete. Nevertheless seventy-one designs were submitted, and the services of an assessor were ultimately obtained. The competitors were astonished to receive from the town clerk of Hove the following information: "I regret to say that after a careful examination of the designs sent in, he" (the assessor) "states that the authors have all either not complied with the conditions or the designs are otherwise defective, and that he is unable to make any award or advise the Council to accept any of them." Seventy-one designs, and not one worthy of acceptance! It was pointed out that although a large proportion of the designs had not complied with the conditions, others, though defective—to use the assessor's own word—might be inferred to have done so, and therefore the assessor ought to make a selection to enable the promoters to fulfil their obligation of paying the premiums. The promoters are on the horns of a dilemma, but the assessor refuses to alter his decision. And now the reasons for his conduct have been discovered, of which the following must be regarded as the gist, no official information being forthcoming.

Out of the seventy-one designs submitted about two-thirds were considered not to have conformed with clause 9 of the conditions, which reads: "In their arrangement the buildings must conform to the by-laws of the Corporation." There seems to have been a considerable misunderstanding on the part of competitors as to the interpretation of a somewhat vague by-law, in consequence of which a number of otherwise good designs were rendered unacceptable. Considering there was some reasonable excuse for this misunderstanding, the assessor endeavoured to persuade the promoters to allow the unfortunate two-thirds to modify their designs,

but this the promoters refused to do and so the assessor declined to make any award. The particular by-law in question had reference to certain open spaces and their relations to the heights of the building. If it had been quoted in the conditions, as it ought to have been, misunderstandings might have been avoided. This is only another instance of the unsatisfactory nature of the conditions.

Matters were not greatly improved by the official list of answers to competitors' enquiries, for in reference to the question as to whether an assessor would be appointed it was stated that such was the intention, but that the ultimate decision would rest with the Council (*i.e.*, the promoters).

It is extraordinary that a member of the R.I.B.A. should have consented to act where the conditions did not even approximately comply with the standard laid down by the body of which he is a prominent member; but assuming that he considered he could do as well or even better than others in assessing a competition which, though bad, might be made worse in less able hands, and excusing his action for this reason, charity of thought can go no further, and no excuse can be felt for the state of darkness in which competitors have been kept, be the motive a feeling of reticence, loyalty to the promoters, or any other. A competitor has a right, earned by his labour and monetary outlay, to an explanation of why his design has not been accepted. In the ordinary way the fact that better designs have taken precedence of his is sufficient reason, but in a case such as this, where no more satisfactory explanation is forthcoming from the promoters than the one issued, it is not too much to insist that it should be furnished by the assessor himself.

This raises a point in connection with the conduct of architectural competitions which was suggested to the Competitions Committee of the R.I.B.A. while they were sitting to draw up a revised set of "Regulations for Architectural Competitions," namely, that the award of the assessor should be published verbatim immediately after his decision. Such a procedure, if the award were sufficiently explanatory, would be extremely instructive to competitors, and would frequently serve to prevent the dissatisfaction so often felt by unsuccessful competitors by showing how and why the selections were made, the reasons for which under the existing system are not always obvious. It is to be regretted that the R.I.B.A. did not see its way to include this suggestion in their new set of regulations, which, on the whole, are otherwise an improvement upon the old ones.

Secondary School, Preston.—The designs submitted in this competition are on view till the end of this month in the Harris Free Library, Preston.

Bethania Baptist Church, Maesteg.—The building committee for this new chapel have been compelled to consider another site, which they hope to settle in a week or two.

Deptford Coroner's Court and Mortuary.—Mr. Horace T. Bonner, A.R.I.B.A., Mr. Albert L. Guy, F.R.I.B.A., and Mr. Alfred Robert, F.R.I.B.A., have been invited to submit designs for the mortuary and coroner's court proposed to be erected at Deptford, London, S.E., at a cost of £4,000. £200 will be paid to the successful architect as commission on the building, and 10 guineas each to the other two architects.

Obituary.

Mr. D. J. Ross, M.I.C.E., formerly engineer to the City Corporation for thirty-four years (from which post he retired a short time ago, being succeeded by Mr. Frank Sumner), died recently, aged 60.

Views and Reviews.

Indian Architecture.

Up to the present the subject of Indian architecture has received quite inadequate treatment. There is much interesting and instructive work in India which few persons have any idea of. The architectural student never thinks of visiting the country, although he occasionally goes as far as Turkey and Egypt in search of examples of Mohammedan architecture, of which some of the finest specimens are to be found in India. This neglect is indeed most unfortunate, because an adequate understanding of the architecture of Greece and Egypt cannot be obtained without an investigation of the movement of architectural thought and tradition which must have come from India and Assyria. Greek architecture is a culmination of the Mycenaean epoch, and the traces of this culture which have been found in Greece and the excavations in Crete and Mycenae show that there is a striking similarity between that and early Indian art, while antiquities that have come to light in Assyria, of which there is very little knowledge published, suggest a connecting link. We know, too, that before the advent of the Suez Canal the overland route to India was the chief means of communication, and the only one before the development of the Cape. Still further back there must have been great commerce, and we can trace from the history of Egypt the wars that went on between that country and Assyria. The Phœnician traders carried the arts and products of the East along the shore of the Mediterranean, and naturally must have left their traces in Mycenaean settlements in Crete. Many of the monuments of India show that there is more than a general resemblance to them, and that many of the architectural forms which we thought to be distinctive of Greece and Rome had their prototype in India. The bracket column, the fluted column, the capital, the entablature, the vault and the dome are alike to be found in India, while in the way of ornament there are all the generic forms, such as the scroll, the acanthus, the wheel, &c.

One of the general things to remark in regard to early Indian art is its naturalistic tendency, the same as is noticeable in all the early arts of the nearer and farther Eastern countries, while the influence of India

has extended, as we know, to China and Japan.

The book now before us, by Mr. Walter Del Mar, author of "Round the World through Japan," does not attempt to deal with the architecture of India, but it serves a useful purpose as a tourist's handbook, and therefore would be of value to architectural students, whom we hope may be encouraged to go to India. The information which the

author imparts regarding the many buildings, ancient and modern, is very scanty, inadequate, and often inaccurate, being based on Ferguson's "History of Indian Architecture," a book which, though it has had a great vogue, is altogether unreliable and incompetent. Many of Ferguson's descriptions and theories were based upon the records of Indian survey officers, who had not the slightest understanding of architecture, and he could not have taken the trouble to go and see the buildings for himself.

There are many styles of architecture in India—Buddhist, Brahmin and Mohammedan—these comprising numerous smaller groups such as Dravidian, Jaina and many others.

There are a number of interesting illustrations in this book, chiefly from photographs by the author, although his selection is not nearly so good as it might have been. We illustrate two views of well-known buildings in India, namely, a rock-cut temple at Ellora, the Kailasa, and another rock-cut cave temple at Karli. The date of the Kailasa is somewhere between the eighth and ninth centuries. It is a Brahminical work. The majority of the cave temples at Ellora are Buddhist, and therefore earlier. It will be noticed from the view how this temple, although excavated out of the solid rock, has been modelled on the form of a timber architecture, indicating that there must have been timber palaces and temples existing at the time, all traces of which have now been lost. Shown in this view are square piers with capitals, bracket capitals, and modelled figures and entablatures. The elaborate form of this temple proves that the architecture from which it was modelled had reached a high stage of development.

The Karli cave temple, on the other hand, is an earlier and simpler type, and is of Buddhist origin. Apparently it was the

THE KARLI CAVE TEMPLE. (From "India of To-Day.")

THE KAILASA, ELLORA. (From "India of To-Day.")

church of a monastery, and it is extremely interesting to see how the tenets of the religion led to the adoption of forms of plan which are very suggestive of the mediæval Christian church plan. In this view the mortise holes by which the wooden decoration of the building was attached can be seen. The peculiar woodwork which reduces the horseshoe opening into a semi-circular arch and other wood screens, &c., still to be found in the temple are believed to be coeval with the other work. The nave is separated from the narrow side aisles by fifteen octagonal columns on each side, while at the back of the dagoba, corresponding to the altar in Christian churches, are seven octagonal pillars forming the apse.

This book makes interesting reading, and will be found of valuable assistance to anyone contemplating a visit to India.

"India of To day," by Walter Del Mar. London: A. & C. Black, price 6s. nett.

Correspondence.

Unsatisfactory Architectural Competitions.

To the Editor of THE BUILDERS' JOURNAL.

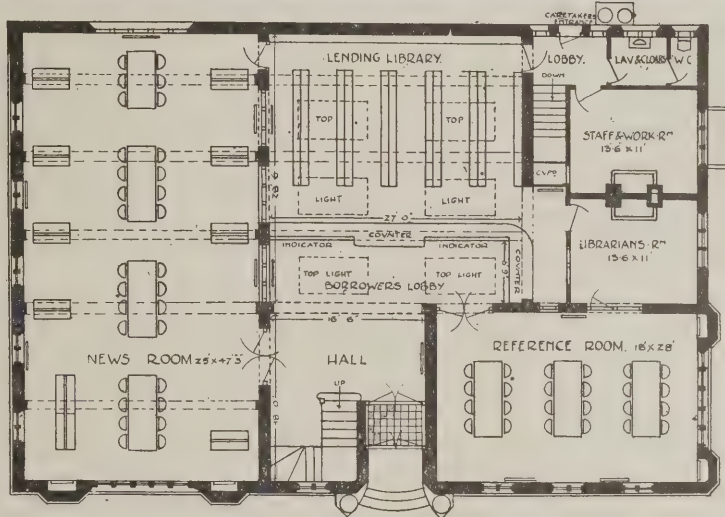

SIR,—You draw attention, I observe, to the question of unsatisfactory architectural competitions, in connection with which I should like to express my views "without prejudice," as the lawyers say, based on nearly forty years' observation.

In my judgment the competition system as now conducted has been "weighed in the balances and found wanting." It is bound to be a failure unless *limited*, with a reliable assessor, and with a payment (great or small, according to circumstances) to each competitor. There is hardly a building in the country the outcome of competition that could not have been done as well—possibly better—without a competition; neither St. Peter's in Rome nor St. Paul's in London was the outcome of one. Why then should the brains, time and money of hosts of young architects be flung away for such inadequate results? Would tailors be so foolish as to make suits of clothes for their clients to select from in the same way and submit to the return of all those that did not in the judgment of the assessor (to wit, the said client) fit to perfection? The present condition of assessors seems to be getting almost as hopeless as that of the competitors themselves.

Judging by the angry letters one reads, competitions appear to have much in common with lotteries, except that they are not illegal.—Yours truly,

E. SWINFEN HARRIS, F.R.I.B.A.
LONDON.

The Transactions of the Edinburgh Architectural Association.—The concluding part of the third volume of these transactions has been forwarded to us. A noteworthy contribution is the paper on Cockerell by the late Mr. Brydon, with some illustrations.—The opening meeting of the session was held on Wednesday last, Mr. Tarbolton presiding. Mr. John Keppie, F.R.I.B.A., read a paper on "Moorish Architecture in Spain," this paper having been written after a visit several years ago to Spain. Mr. Keppie described some of the principal buildings in Madrid, Cordova, Granada and Seville. Moorish architecture, he said, referring more especially to the Alhambra, spoke to the senses rather than to the mind; it pointed to voluptuousness rather than to thought. It resembled a brilliant charm, a caprice of the genii who might be imagined to have disported themselves in the network of stone, in the delicate openwork, light fringes, embroideries, &c. The Alhambra was an Oriental poem.

SECOND-PREMIATED DESIGN FOR CHESHUNT PUBLIC LIBRARY. ERNEST A. SUDBURY, ARCHITECT.

CHESHUNT LIBRARY COMPETITION.

WE publish in this issue the first- and second-premiated designs in the competition for a public library at Cheshunt, in Hertfordshire. More than one hundred and eighty designs were submitted for this little building, the assessor being Mr. J. S. Gibson, F.R.I.B.A. The conditions stated that the author of the design placed first would be employed to carry out the work (unless a sufficient reason existed to the contrary) and would be paid the usual commission of 5 per cent. according to the R.I.B.A. schedule; the author of the design placed second being paid the sum of twenty guineas, and the third ten guineas. In the event of the council giving no instructions to proceed with the work within twelve months after the award, the selected architect would be paid the sum of £45, such sum to merge into his commission of 5 per cent. if the building were carried out from his design.

The site proposed for the library is known as the Manor House, Cheshunt. In the first-premiated design, by Mr. J. Myrtle Smith, of Chelsea, the principal elevation faces Turner's Hill, and the entrance has been made on this, the west side. The plan has been set out so that complete supervision may be effected by the staff from the lending library, which

is directly opposite the entrance, the lending library and the entrance hall being thrown into one so as to give a spacious apartment and avoid unnecessary glazed partitions. The news- and magazine-room to the left is separated by a glazed screen up to the ceiling, with entrance from the hall and with a staff access door from the lending department. The reference-room on the right has a service counter directly adjoining the lending library for the issue of reference books; also an access door for the staff. The ladies' room on the first floor (which was one of the requirements of the conditions) is reached by a stair from the entrance hall. Below the staff room is placed the heating chamber with access stair. The building is to be built with local red facing bricks, five courses to the foot, with white Portland stone base, string-courses and central feature; roofs to be green Westmorland slates, with lead ridges and finials. The architect estimates the building to cost £2,900 inclusive of heating, ventilating, apparatus, lighting and water.

The second-premiated design, by Mr. Ernest A. Sudbury of Nottingham, is estimated to cost £2,770, leaving £230 for interior fittings. The accommodation is shown by the plan above. The third-premiated design was by Mr. R. Wylie, of Gateshead.

LIFTS.

Hydraulic Power v. Electric Power.

WE have received a very interesting pamphlet issued by the London Hydraulic Power Co. on the question of the comparative efficiency and economy of high-pressure water power and electric power for use in connection with lifts and cranes. It is a question which is of considerable interest to a great many people at the present time, as the use of lifts of some kind has become universal in public buildings and is largely extending in private houses also.

Of course, the London Hydraulic Power Co. approach the matter from their own standpoint. The fact, however, as pointed out in their pamphlet, that they have now run over 150 miles of main for the express purpose of supplying power for working machinery, and that there are now nearly 6,000 machines working from their system, sufficiently indicates that their supply has been of immense value in providing motive power and has been very largely taken advantage of.

Electric Power a Serious Competitor.

The introduction and distribution of electric power of course is now proving a very serious competitor, and the advocates of electricity make for it very high claims which naturally tend to threaten the practical monopoly which has been enjoyed by the London Hydraulic Power Co.

In these circumstances a comparison of the various claims made will probably be of some service.

The Hydraulic Power Co. supply through the greater part of London water suited for driving machinery, especially lifts and cranes, at a pressure of 700 lbs. per sq. in., which is obtained by pumping into accumulators at several different stations, the accumulators being loaded to give the requisite pressure per square inch, and the water being delivered at the standard pressure throughout the area supplied. The advantages of working at a high pressure of this description, as compared with the pressure from the ordinary street main of about 30 lbs. to 40 lbs. per square inch, will be obvious, especially as the pressure can be always relied upon instead of fluctuating, as is frequently the case with the ordinary mains.

Hydraulic Power on a Sliding Scale.

The Hydraulic Power Co. supply this motive power on a sliding scale, which varies from a minimum of 25s. per quarter for 3,000 gallons down to about 1s. 6d. per thousand gallons, in proportion to the quantity of water which is consumed, so that for large establishments the economy is greater than for smaller ones.

On the other hand, the electric supply companies are now providing, for the greater part of London, continuous current suitable for driving reversing motors at prices varying from 3d. per unit to 1½d. per unit, at which price some of the borough councils are supplying current for motive power. Current for power purposes is universally supplied at lower rates than for lighting, as the greater part of the demand occurs during the day, when the lighting is not greatly in use, the power supply being intended to furnish a means of employing the plant at the station instead of allowing it to be idle, and thus to provide even at a low figure a profitable revenue. There is a fallacy in this argument, however, for during the winter months the maximum demand for light and power in many cases occurs about the same time, and additional plant is therefore required for the power load.

Both Sides of the Case.

After carefully considering the various arguments introduced in the Hydraulic Power

Co.'s pamphlet, and comparing it with other statements to which they draw attention, it is evident that there is a good deal to be said for both sides of the case. Generally speaking, a hydraulic machine is simpler and has fewer complicated working parts than an electric machine, and consequently for heavy and rough work it is less liable to require adjustment and can be more safely entrusted to unskilled attention.

With the ordinary hydraulic lift, operated by hand-rope control, there is a certain amount of labour in stopping or starting the lift and a considerable amount of judgment required in accurately reaching the landing level: this, of course, is easy where the lift has a regular attendant who is always working it—but with an electric lift it is possible to provide an electric control that may be worked by a car switch with a handle which is self-centering when released, so that it is always perfectly certain when the current is completely shut off; and it is also possible to use an automatic push-button control which can be operated by a lady or a child without the slightest exertion, the lift being started by pressing a button and stopping automatically on arrival at the floor desired. It is easy to fit interlocking arrangements to the doors to prevent the lift being started when any door is open or to prevent the doors being opened when the lift is not there, as this can be simply arranged electrically in connection with a controller of this type. An arrangement of this kind can, however, be fitted to a hydraulic lift at an additional expense and complication, the same as with the electric lifts, an electric supply for this control being necessary, but the fitting is not quite so easy as with an electric lift.

With an electric lift there is no possibility of the lift creeping, which may occur sometimes with a hydraulic lift in case of leakage from the valve or gland.

Caution advisable in accepting Figures.

The main advantage, however, claimed on behalf of electricity is the cheapness of the motive power, and there is no doubt that at the very low rates now in force this advantage is sometimes considerable. A certain amount of caution must, however, be observed in accepting figures which are sometimes published showing the cost of running electric lifts, as, unless the current is taken on some definite basis, the figures are not altogether reliable.

The most satisfactory method of testing the current consumption of an electric lift, and the one usually adopted by leading consulting engineers at the present time, is to run the lift with a specified load a sufficient number of journeys to consume one or more units of current as registered by the meter, and, of course, this gives a reliable test as to the total consumption of all parts of the machine.

It is claimed, with a certain amount of accuracy that in an electric lift the power consumed is more in proportion to the duty being performed than is the case with a hydraulic lift which uses the same amount of power-water with any load in the cage. It must, however, be borne in mind that with an electric lift, in which half the live load is counterbalanced, a very large proportion of the current is consumed in driving the machinery and the working parts, and consequently the variation in current consumption owing to difference in load is not really very large. An electric lift under these conditions, run a good number of journeys with full load up and down, half load up and down and no load up and down, would give much the same current readings in each case. The maximum duty would, of course, be required when the cage was ascending with full load and descending empty, which would seldom happen in the case of a passenger lift, where

there is always at any rate the attendant in the cage. A diagram in the pamphlet illustrates some of the peculiarities of the consumption of current in electric lifts.

In considering the comparative economy of hydraulic and electric lifts there are other factors which have to be taken into account, such as the amount of duty the lift is likely to perform and the number of lifts required in the building, these being important features owing to the sliding scale adopted by the Hydraulic Power Co.

There is also another point to consider in the case of high-speed lifts, namely, that the first cost of an electric lift increases in proportion to the speed, as a larger motor and gear are required; but with a hydraulic lift the size of the machine and the water consumption remain the same, the speed being regulated by the size of the supply pipes.

In the United States, where very high buildings exist and a number of lifts are employed in one building, the latest practice is to use high-pressure hydraulic machinery in order to get high speeds of 400ft. to 500ft. per minute without unduly increasing the cost of the machinery, and also because at these high speeds the wear on hydraulic machines is much less and there is greater safety.

Comparative Costs.

In order to give some idea as to the comparative cost, we may take as a basis case a passenger lift arranged to carry 7½ cwt. a height of about 60ft.

The cost of an electric lift to do this duty at a speed of about 150ft. per minute would be about £320, and the lift would make about twenty-two complete trips (up and down) per unit of current consumed. The cost of a similar lift to run at a speed of 250ft. per minute would be about £375. The cost of a high-pressure hydraulic lift would be about £220 and the water consumption would be about 6 gallons per trip.

The running cost of the hydraulic lift, assuming that the lift made 100 full journeys per day and taking seventy-five days per quarter, would come out about £9 per quarter. An electric lift making the same number of journeys with equal loads up and down, and taking current at 2d. per unit, would cost about £2 17s. per quarter, showing a considerable saving in favour of the electric lift; but from the pamphlet of the Hydraulic Power Co. it appears that such a calculation is not accepted as correct, because in practice equal loads per trip are not taken up and down, and that, in consequence, the current cost may sometimes be considerably increased. There is evidently something in this contention, so that the cost for the electric lift might vary from about £3 to about £5 per quarter.

If, on the other hand, there were two similar lifts working in the same building or in buildings owned by the same proprietors and doing the same duty, the cost of the hydraulic power would then come out about £14 15s. per quarter and the electric current from about £6 to £10.

If there were three lifts, hydraulic power would come out about £20, against from £9 to £15 for current, and of course as the number of lifts increased the difference between the electric and hydraulic power would correspondingly reduce. At 1s. 6d. per 1,000 gallons the hydraulic cost would only be £3 7s. 6d. per lift.

Specimen Figures.

There is, however, another item which is frequently overlooked, and that is the extra allowance which should be made for interest and depreciation upon the greater first cost of the electric lift.

To give a clear view of this we give the following specimen figures based upon the lift considered above:—

Other Considerations to be taken into account.

These, of course, are only specimen figures and they would not work out exactly in such ratios under all conditions but they will be sufficient to suggest that there are various considerations which should be taken into account in order to arrive at an impartial conclusion. Of course, in the case of lifts which are seldom used it would take a long time before the saving in current equalled the difference in the first cost.

As regards reliability and cost of repairs, there would probably be about an equality in the long run. A hydraulic lift requires perhaps more regular attention in the way of packing and adjusting, and probably in the earlier years would cost more to maintain in complete running order than an electric lift. On the other hand, there are more wearing parts in an electric lift; and for a long term of years, while there might be fewer regular adjustments, there would probably be some more expensive renewals, which, during the life of the lift, would work out to about the same result.

There are a number of high-pressure hydraulic lifts in London, Liverpool and other places which have been working for twenty-five years, and these are now running as well as when they were first erected. There are not many electric lifts in this country which have yet been in operation for so long a period, and it would perhaps not be safe to say that they would be in equally good condition when their life has extended to the same length.

From these suggestions it would be seen that the question as to the most suitable arrangement to adopt is largely a question of comparative considerations and conditions which vary greatly according to the requirements of the particular case. In any case it is worth suggesting that whatever form of lifting apparatus is employed it is desirable that it should be of the very best quality in order to ensure a really economical result, and that this especially applies to electric machinery, as cheap appliances of this class are almost certain to cause considerable trouble and expense in running for

a comparatively short time; and as there are a good many firms who are making and supplying parts of electrical machines, these may be purchased and put together by engineering firms who are not in a position to build a complete machine themselves, in which circumstances the various positions are not likely to give such satisfactory results as a completely designed and constructed machine by a first-class maker.

INGRAM HOUSE, STOCKWELL.

THIS is the first house erected in the south-west of London by a company formed for the purpose of providing residential clubs for young men. The building has lately been completed, having been in progress for just over two years. The site is at the rear of four large houses in the Stockwell Road.

The accommodation in the main building is for 208 residents, with staff in addition. The bedrooms are disposed in four floors placed above two floors of social rooms and administrative offices, with a mezzanine in one wing for the staff bedrooms. The lowest floor-level is 5ft. below ground, so that the basement has ample light and air. The principal club floor is thus raised 10ft. above ground, and is approached by a short flight of black Belgian marble steps starting from a vestibule at the ground level and leading up to the principal lounge. From this point the dining-room and library are reached on the left, and the smoking-room and billiard-room on the right. The plan is that of a St. Andrew's cross. The large dining-room, which will seat the 208 residents at small tables, occupies the centre and one wing, the other club-rooms mentioned above occupying the remaining three arms of the cross. In the dining-room the central feature is a high relief of one of the nine labours of Hercules. The library is completely lined with book-cupboards with oak facings, the two chimney-pieces forming part of the design. The billiard-room, which takes three full-size tables, has a high dado of white-painted deal panelling, with the chimney-pieces in oak, one of which has some carving executed by Mr. Markham from the design of the architect (Mr. Arthur T. Bolton, A.R.I.B.A.). In the smoking-room the walls for a height of about 9ft. are divided out by wood mouldings into panels framing on the main piers a set of blue and white tile panels. In all of these rooms there are panelled window seats forming part of the scheme, and where required the radiators are placed beneath the same. The various lobbies and passages are treated with cross-vaulted and intersecting plaster ceilings on wood cradling; these were executed by Messrs. Aubrey.

Bedrooms.

The two staircases to the bedrooms to the right and the left are placed at the junction of the arms with the body of the cross and are all framed in teak with solid newels rising four floors in height by four short flights of four steps, each with quarter- and half-space landings, the staircase cages of brick walls and arches forming a hexagon on plan. There is a glazed lantern over each staircase. From the nature of the plan all the bedrooms look out into the open, and there are no back or courtyard rooms, the rooms being all of equal value. There are three grades in the size, the standard being 7ft. by 10ft., but the twenty-four centre rooms are 10ft. by 8ft. and the forty angle rooms are 10ft. by 9ft., these last having two windows to each room. The rooms are all divided by solid concrete slab partitions 3ins. thick, and each has a fitted hanging cupboard and a bookcase in addition to the movable furniture.

On the asphalted roof of the building, at

a height of 63ft. above ground, a fine promenade is provided commanding an extensive view over South London.

The basement contains a lecture hall fitted as a gymnasium, having a storage cellar under the vestibule for the chairs and apparatus. The kitchens and servants' quarters occupy two arms of the cross on the other side of the lecture hall.

The building has its own water-supply from a well in the chalk, 350ft. deep, raised by a pump driven by a gas-engine, the storage tanks for the water being placed on the roof.

As regards the exterior, above a plinth of purple Luton bricks about 10ft. high the building is faced with stock bricks, with pilasters and a deep frieze and cornice in red bricks. The moulded bricks were supplied by Messrs. Lawrence, of Bracknell, most of the work being special made. The brick carving was executed by Mr. Arrowsmith in Lawrence's red rubbers to the architect's designs.

The central segmental pediment contains a high relief of Apollo, modelled by Mr. Fagan and cast in lead by Italians according to the *cira perduta* process. On either side of the main arch above the entrance are two large ovals in salt-glazed ware, deep-blue and light-green in colour, representing Youth and Age. These, together with the Four Seasons burnt in terra-cotta and used in the internal decoration of the club-rooms, were modelled in low relief by Mr. Broad, of Messrs. Doulton & Co., and at whose Lambeth potteries they were successfully fired.

The Contractors.

The general contractors were Messrs. Rudd & Son, of Grantham, the clerk of works for the first eighteen months having been the late Mr. D. Davies and for the completion Mr. Joseph Weaver. The quantities were taken off by Messrs. Widnell & Trollope, of Westminster; the constructional steel was supplied by Messrs. Dorman, Long & Co., to details worked out by Messrs. Reade, Reilly & Jackson, consulting engineers; the heating and hot-water supply, and also the fitting-up of the kitchen, was executed by Messrs. Clements, Jeakes & Co., of Bloomsbury; the deep-well water-supply was carried out by Messrs. Isler & Co.; the internal plumbing and fire service is by Messrs. Beaven & Son, of Victoria Street, S.W.; the electrical installation was executed by Messrs. Shalders & Davis, of Southampton; the gas cooking apparatus was supplied by Messrs. Fletcher, Russell & Co., of Queen Victoria Street; the oak block floors were laid by Messrs. Turpin; the electrical fittings were made by Messrs. Hands, of Snow Hill; the asphalt roof was executed by Messrs. Faldo; the cart road was laid in Granolithic by Messrs. Stuart, and the tar paved approach roads by Messrs. Constable, Hart & Co. Hall's washable distemper and Charlton white enamel paint have been used in the internal decorations; the plastering (including the decorative work in the same) was executed by Messrs. Aubrey, of Woking; the wall tiling has been supplied and fixed by Messrs. Van Straaten, as were also the black marble stairs and black and white marble paving of the vestibule; the wrought-iron staircase balustrading of the principal stairs to the club floor was made to the architect's design by Messrs. E. & R. Gittins, of Birmingham, as also the two outside lamps, in wrought copper, at the main entrance; the locks and all the ironmongery (mainly in gunmetal) and the cast-iron rain-water pipes and heads were supplied by Messrs. Lockerbie & Wilkinson, of Victoria Street; and Mr. Robert Adams has supplied the swing hinges and Davies's patent automatic lantern and gearing and fanlight openers.

A perspective and plan of the building appeared in our issue for May 11th, 1904.

Keystones.

Liverpool Architectural Society.—Last week Mr. A. Needham Wilson, A.R.I.B.A., read his paper on "Sketch Plans and Working Drawings" before this Society.

A Gigantic Statue of Justice will surmount the dome of the new Sessions House in Old Bailey. It is the work of Mr. F. W. Pomeroy, and is of bronze 20ft. high, weighing $3\frac{1}{2}$ tons.

Stones of Canterbury Cathedral to go to America.—Some of the stones which it has been found necessary to remove from the Bell Harry Tower of Canterbury Cathedral in the course of its reparation are to be sent to America for incorporation in the new cathedral at Washington.

Mr. Goodyear's Last Lecture on Architectural Refinements was delivered at Edinburgh last week. At the outset he showed photographs taken at Lanercost and Hexham, the latter, he said, being especially interesting as a valuable illustration of the outward divergence of the verticals in the choir and transepts. Mr. Goodyear then dealt with Notre Dame, showing the curves in plan in the nave, which were parallel and opposed to the thrust on the north side, and rose to the parapets of the exterior walls as high as the roof. These curves of the nave appeared to be related to the deflection of the choir of Notre Dame, which was already known to exist, but they also appeared to force a new explanation of the deflection of the choir. It was impossible to conceive that incompetence of the builders would explain these curves in plan, because the majority of French cathedrals showed absolutely true lines in the nave. He argued that these variations of alignment were intended to give picturesque effects and to annihilate the monotony of the straight line. Mr. H. O. Tarbolton, president of the Edinburgh Architectural Association, in conveying a vote of thanks to Mr. Goodyear, said that he had thrown a new light on mediæval architecture, and had given them a glimpse behind the scenes. He was convinced that Mr. Goodyear had proved his points in most cases up to the hilt, and there were many who shared that view.

An Epitome of Civil Engineering.—Sir Alexander Binnie, the new president of the Institution of Civil Engineers, said in his address to this Institution last week that civil engineering in this country only dated back to the eighteenth century. The illiterate Brindley constructed the canals which laid the foundation of inland navigation. Smeaton, a man of the highest intellect, engaged in almost every class of engineering work. John Rennie built Waterloo Bridge, and was engaged in the construction of the London Docks. Telford at one time worked as a stonemason for ordinary wages during the building of Somerset House, and afterwards became the great bridge-builder of his age. Summarizing the history of the science, the president said that as the period before 1832 was the age of road-making, canal-engineering and the beginning of docks and harbours, so the period which had since elapsed was essentially the railway epoch. Coincident with the growth of railways had been the advance in electrical science and the development of sanitary and marine engineering. It might be fairly claimed that during the Victorian era the resources of science had been applied to the needs of mankind to a greater extent than in any other age. Looking ahead, the investigations of recent years into the laws which governed the constitution of matter were gradually forming in our minds new conceptions as to the structure of all inorganic bodies, and he thought we might look for developments in the future as much unsuspected as was present-day knowledge by the scientists of the eighteenth century.

An Attractive Calendar commencing December, 1905, and continuing till December, 1907, has just been issued by Messrs. W. Summerscales & Sons, Ltd., laundry engineers, of Keighley, who will be pleased to forward one to any reader who makes application.

British School in Rome.—As the Government grant promised to this school will not be made till next April, it has been decided not to appoint anyone as director during the present season. Meanwhile, Mr. T. Ashby, jun., will be in charge of the school, and has returned to Rome to take up his duties.

Liverpool Cathedral.—At a meeting of the executive of the Liverpool Cathedral Committee held last week Mr. Gilbert Scott, the architect, reported that good progress was being made with the foundations, which would be completed by March 1st next, when the building of the cathedral proper would be proceeded with.

The next Arts and Crafts Exhibition.—The triennial exhibition of the Arts and Crafts Exhibition Society (of which the president is Mr. Walter Crane and the hon. secretary Mr. E. S. Prior, 3, Old Serjeants' Inn, W.C.) will in all probability be opened about January 15th next in the Grafton Gallery, instead of in the New Gallery as hitherto. The receiving days will be December 28th and 29th.

Change of Address.—Owing to the considerable extension of business during recent years, both at home and abroad, Messrs. Wailes, Dove & Co., Ltd., makers of "Bitumastic" enamels, have removed into new offices at 26, African House, 6, Water Street, Liverpool, where their local director, Mr. George R. Brace and his assistants, Mr. O. A. Bley and Mr. W. Nixon Porter, will continue to look after the firm's interests.

Architects and Municipal Elections.—In connection with the municipal elections at Newcastle-on-Tyne the Northern Architectural Association sent out letters to candidates asking whether or not they were in favour of municipal architectural work being carried out by local practising architects instead of by Corporation officials. Of the six elected representatives of different wards, two replied declaring themselves in favour of the Association's desires.

A.A. of Ireland.—A meeting of the Architectural Association of Ireland was held last week, Mr. Harry Allberry presiding. Mr. W. J. Fennell, M.R.I.A.I., of Belfast, delivered a lecture on "The Golden Age of Gothic Art"—the English period spanned by the Decorated and the Perpendicular.—The Green Book of the Association has just been issued. The Committee's programme for the current session includes the co-ordination and extension of the classes to enable Irish students, *inter alia*, to study for the R.I.B.A. examinations; also the formation of a museum of building materials and of a day and evening studio.

Change of Name.—The Automatic Sculpture Syndicate, Ltd., of 62 and 64, Sumner Street, Southwark, S.E., has changed its name to the Sculpture and Carving Syndicate Ltd. It was found that the use of the word "automatic" created a false impression as to the methods employed by the syndicate, and the company desire to point out that all work done by them is carved by hand, machinery being utilized only for roughing out and pointing. Special attention is given to the high-class finish of all work, and in order to ensure this the syndicate has secured the services of Mr. Courtenay Pollock, R.B.A., who personally superintends the modelling and carving of all work. The syndicate can therefore guarantee high-class work at prices considerably below the average. If desired, work can be roughed out at the firm's premises and carved *in situ*.

Builders' Notes.

A new Theatre at Cardiff is being erected in Park Place from designs by Messrs. Ernest Runtz & Ford, of London. The builders are Messrs. James Allan & Son.

Conference of Plumbers.—The half-yearly conference of the National Association of Master Plumbers of Great Britain and Ireland was held in Birmingham on Wednesday last.

Messrs. Mellowes & Co., Ltd., of Corporation Street, Sheffield, have recently been favoured with orders for glazing on their "Eclipse" patent imperishable system the roofs of new car-sheds at Derby, Glasgow University, Devonport Dockyard, extensions of works for Cammell, Laird & Co., Ltd., at Sheffield, North British locomotive shops at Glasgow, and the premises of Beardmore & Co., Ltd., at Glasgow.

Guard Rails on Scaffolding.—At the inquest held at Keighley last week upon the body of a plasterer who was killed by falling off a 24ft. scaffolding at the new Wesleyan schools in Temple Street, Keighley, the jury returned a verdict of "Death by Misadventure," but strongly urged that the Home Office recommendations should be adopted in such trades, namely, that a guard rail should be fixed to platforms above 8ft. high, and that platforms should be 18ins. wide. In this particular case the deceased was working on a single plank.

London Building Trade: L.C.C. and Revised Working Hours.—Revised working rule agreements have been made between the London Master-Builders' Association and the bricklayers, carpenters and joiners, stonemasons, plumbers, general smiths and fitters, and the working hours during the year have been altered so as to provide that forty-four hours a week shall be worked throughout the thirteen weeks of winter, except in the case of plumbers, who will work $41\frac{1}{2}$ hours a week for the first ten weeks of winter. The revised working hours came into operation as from Monday last. There are no working rule agreements between the Association and the mill sawyers', painters' and labourers' societies. The existing working rule agreement between the Association and the plasterers' society does not terminate until March 3rd, 1906, and consequently no alteration is made in the working rules of that trade. The Works Committee of the London County Council think it desirable that the trades of timbermen and scaffolders and of mill sawyers and wood-cutting machinists, who are now classified in the list of rates of wages under "various trades," should be placed under the head of "building trades," and that the rate of pay for overtime worked by the two former trades should be the same as labourers and navvies, namely, after 7 p.m. until 8 p.m., time and a half. The Works Committee also recommend that the hours of labour of the following trades inserted in the Council's list of rates of wages and hours of labour be amended, and be during the thirteen weeks of winter, commencing from Monday last, forty-four hours per week:—Carpenters, joiners, bricklayers, bricklayers (cutting and setting gauged work), masons (fixing), masons (granite work), masons; smiths, fitters, gas-fitters, &c. (In shops, general smiths and fitters to work summer hours throughout the year, should the employer desire it.) The Works Committee further recommend that the hours of labour for plumbers and their mates inserted in the Council's list of wages and hours of labour be amended, and be during the first ten weeks of winter, commencing from Monday last, $41\frac{1}{2}$ hours per week, and for the next three weeks forty-four hours a week.

SAND FOR MORTAR.

Some New Tests, and Conclusions drawn from them.

ONE would hardly have expected, says "Engineering," that in these days it would have been possible to teach engineers (or builders) anything of importance regarding the sand which they mix with their limes and cements; and yet a series of tests carried out during the last few years by Mr. James C. Hain, engineer of masonry construction to the Chicago, Milwaukee and St. Paul Railway Co., seem to show that there is still something to be learnt about it. We have become so much accustomed to the idea that the only kind of sand to use when making mortar or concrete of the first quality is one which is coarse and sharp, as well as free from clay, that any other kind is never mentioned in our specifications; it is, therefore, somewhat startling to be told that these qualifications are really not necessary, it being quite possible to make first-class mortar and concrete by the use of even the finest sand, and that clay, rather than being a drawback is, in certain proportions a distinct benefit. If some careful tests carried out by Mr. Hain during a series of years teach us anything, however, it is that we can materially modify our views with regard to the undesirability of using either a very fine-grained sand, or one that contains a considerable percentage of clay, without

running any risk of obtaining a mortar inferior in any way to one made with sand that is regarded as orthodox.

The reason for making the tests referred to was that in the construction of some large concrete work on the Chicago, Milwaukee and St. Paul Railway a great quantity of sand was required, and it could be procured from various sources over the entire system of 7,000 miles; but the question was to decide which of the various pits belonging to the company supplied the most suitable material with the least haulage. This led to laboratory tests of questionable sands. A full account of the tests is given in a paper read by Mr. Hain before the National Association of Cement-Users at Indianapolis. A mixture of 1 part cement to 3 of sand was used throughout, and each of the tensile tests recorded in the paper represents the average of three briquettes, except in cases where one test appeared exceptionally irregular, in which case it was discarded. The tests have extended over three years, and are still being carried out.

Clay Heterodoxies.

The conclusion arrived at by Mr. Hain is that clay in limited quantities, say not more than 12 per cent., is beneficial in sand if thoroughly distributed throughout the mass; but before using the sand should be compared with an established standard. He also thinks that washed sand may sometimes be less desirable than unwashed, because

washing is apt to remove the fine grains which are required to fill up the voids; and the only safe way to decide this point is to test the sand under both conditions. A fine sand may show up well if the grains are properly graded, and a coarse sand may show up badly if it contains too few fine particles to fill the voids. The best graded sand is one in which the grains are held on a uniform series of sieves, so arranged that the voids in one lot are filled (but not over-filled) by the grains in the next smaller size, and so on.

To sum up briefly, the best mortar sand found in nature is one with sharp corners, rough surfaces, with grains neither all coarse, all medium nor all fine, but with the proper mixture of these sized particles. The sand also need not be washed, but may contain up to 12 per cent of clay, which is more likely to improve than injure it.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Wooden Pegs for Fixing Tiles.

BROMLEY.—W. H. S. writes: "I am advised to use some hand-made Kentish plain roofing tiles on a house about to be erected. I have had no experience of new wooden pegs for fixing the same, but understand that pegs last about ten times as long as nails. Square deal pegs are recommended, two to each tile, which is without nibs; do you consider pegs as described the best for the purpose; if not, what would you recommend?"

Oak pegs should be used.

Testing Sewage Effluents.

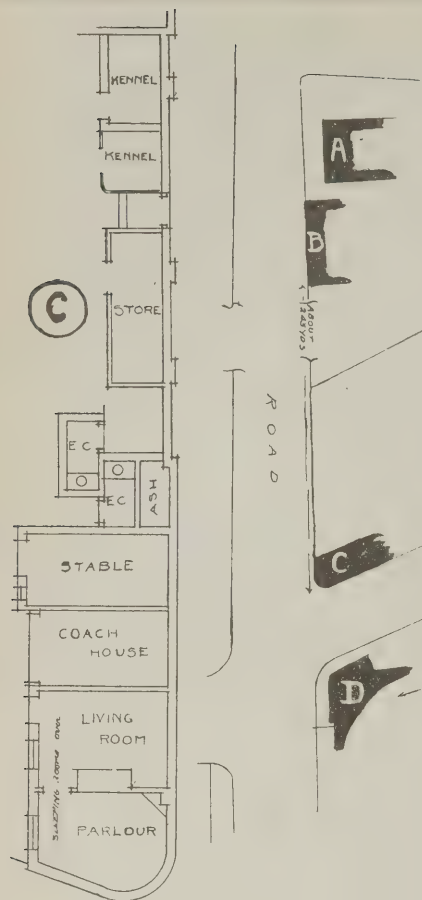

MOFFAT.—ANXIOUS writes: "Please give a simple test for roughly judging the quality of the filtered effluent from a sewage works."

The old-fashioned test of tasting—just tasting—the effluent is going out of fashion, as it is a somewhat unpleasant one. Examination should be made of the transparency and colour—at least 5 ins. or 6 ins. of water should be looked through. Then test for odour by putting some of the effluent in a bottle; shake violently, and on removal of the stopper, smell immediately. An earthy smell, resembling newly-turned mould, may usually be taken as satisfactory. Another test for average conditions may be made by getting a number of clear glass stoppered bottles of equal size, taking a sample each day and keeping each sample for a week. Any tendency to secondary decomposition can then be noted—a green dirty scum is evidence of this. The samples should be daily inspected. The most absolute test is to keep goldfish in a glass bowl, using only the effluent as the water supply. Draw off each morning by means of a syphon the greater part of the water, replacing with an equal quantity of the day's sample, which has been well shaken. If the fish live, and show no sign of distress, the effluent is satisfactory. The gold fish require feeding. We would recommend you to purchase "Simple Methods of Testing Sewage Effluents for Works Managers, Surveyors, &c.," by George Thudichum, F.I.C., 2s. 6d. nett, post free from these offices. This gives various other particulars about averaging samples, &c., of which you should be informed.

REV. F. K. OLIPHANT, ARCHITECT. (Royal Academy Exhibition, 1905.)

This screen has been designed and executed with the extreme simplicity suitable to a small parish church. It is deeply recessed and panelled at sides, and, with a wide rood loft over, the result is effective. Upon the rood loft stands the holy rood, with figures of St. Mary and St. John to be added. Behind the rood are the six rood lights. The work has been executed in oak by Messrs. Skeeler Brothers, of St. Ives. The carving is by Messrs. Thompson & Son, of Alconbury, and the metal-work by Mr. Jude, of St. Ives: from designs by the Rev. F. K. Oliphant, Rector of Houghton.

Street Frontages.

MOSELEY.—X. writes: "The accompanying plan shows some premises proposed to be erected near here. This plan has been submitted to the local authority and disapproved, the surveyor asking that the building shall be set back 9ft. instead of remaining flush as shown [Public Health Act (Buildings in Streets), 1888]. The surveyor contends that the buildings B and C are not in accordance with the Act. This is entirely contrary to what I have always understood. A is a house 9ft. back from the street; B is a coach-house flush with the street; C is flush with the street (see detailed plan); D is a shop the main wall of which is 9ft. back from the street. I shall be glad to have your opinion on this matter and, if I am right in my contention, as to the best course of procedure."

Your question is not quite clearly stated, but I will assume that A and D are existing buildings (and not new ones which you now propose to erect), and that your query refers only to the passing of plans for buildings marked B and C on your sketch plan. The correct frontage line for these new buildings will then be formed by a line drawn from the front wall of A to the front wall of D—this being, I suppose, practically equivalent to the 9ft. the council's surveyor asks for. Section 155 of the Public Health Act, 1875, runs: "An urban authority may prescribe the line in which any house or building or the front thereof shall be erected." Section 3 of the Public Health Act, 1888, enacts "it shall not be lawful in any urban district without the written consent of the urban authority to erect or bring forward any house or building in any street or any part of such house or building beyond the front main wall of the house or building on either side thereof in the same street, nor to build any addition to any house or building beyond the front main wall of the house or building on either side of the same." The Act provides for a penalty of not exceeding forty shillings per day after notice is given.

F. S. I.

White Stucco.

CHELMSFORD.—E. W. H. writes: "Please state the proportions for a good white stucco for external work, so that the colour will last. I have tried several kinds, but they have lost colour after a short time."

See a reply to an enquiry on this subject on p. 440 of your issue for January 9th, 1901.

Earth-closets.

RUSTIC writes: "(1) What is the address of Moule's Earth-Closet Co.? (2) Who are the makers of an earth-closet which has a separate receptacle for the soil and the urine? (3) What is the manurial value of the soil and ashes, &c., taken from an earth-closet? How should it be applied to the garden; and, generally, how is an earth-closet managed?"

(1) The address of Moule's Patent Earth-Closet Co., Ltd., is 5A, Garrick Street, W.C., and Brownlow Mews, W.C. (2) Mr. J. Donkin, 4, Albert Road, Bournemouth. (3) The earth-closet refuse has no manurial value in a fresh condition. The dangerous organic matters must first be resolved into simple harmless constituents by the action of bacteria in the soil; and by other bacteria these harmless constituents are built up into nitrates and nitrites, which form the food of plants. Until these bacteriological processes are effected no manurial benefit accrues to the soil. So the closet refuse should be buried in the ground and left for a time—say three months before disturbance. The most suitable method is to have a long shallow trench prepared (not more than 18ins. deep) and to empty the pail contents into it; covering each deposit with some of the excavated soil until the trench is filled, when another trench must be prepared. In emptying the pail contents see that the refuse is not left in a heap, but spread a little along the trench; otherwise the bacteria will take an unconscionable time to work through the mass. After the necessary time has elapsed the soil where the trench existed should be turned over and a crop planted. The first crop on such ground must not be a root crop. In the manner described the whole of the garden or, at any rate, the kitchen garden will gradually be utilized for the trenches, and thus the soil will be manured. But a good deal depends on the size of the garden. The soil takes times to digest the strong organic matters offered it, and the application of the refuse must not be done too often. How frequently an earth-closet should be emptied is a matter of opinion. Once a week is often reckoned sufficient; but more often the pail is emptied when it is full—and how long this takes depends on the number of people using the closet. It is better to have the pail emptied daily, and it will be found less troublesome to remove.

Cement Floors.

DORSET.—INTERESTED writes: "(1) Why is it that a cement floor which has been laid more than five months wears up every time it is scrubbed, or when a stiff broom is used for cleaning, after the floor is washed with hot water? The floor was put down to the following specification:—'Pave the floors with cement granite concrete 2ins. thick, composed of 1 part of the best London Portland cement to 2 parts granite, on a 6in. bed of broken stone or flint.' (2) Will it be necessary to break up the floor and relay? (3) The cement used is of a good bluish-grey colour. I have roughly tested it with the flask test, and by putting it under water on a piece of slate for twenty-four hours. These tests it bore excellently. Do you consider it should be analysed?"

It is not unusual to find persons blaming the cement for any trouble that may occur in concrete work, when they never think of

investigating the aggregate, the water used, or conditions of laying. We should think the trouble in this instance has arisen from one of the following causes:—(1) That the broken granite was composed of much dust, which would make the concrete crumbly; (2) that the concrete was worked up again after it had begun to set; or (3) that the dry broken stone foundation had absorbed all the moisture, and that the work was not kept wetted with moistened sand or sawdust over it so as to get it to set hard. The floor should be relayed, and we advise an under-layer of rough concrete 4ins. thick, and 2ins. of fine granite aggregate concrete on the face. It is nonsense to talk of judging the quality of a cement by its colour.

Institution of Civil Engineers' Examinations.

STRATFORD-UPON-AVON.—P. H. writes: "Where can I obtain questions set at the students' examinations of the Institution of Civil Engineers for the past two or three years?"

Apply to the secretary of the Institution, Great George Street, Westminster.

Concrete Floors.

DUNFERMLINE writes: "Is ammonia from horse or cattle urine injurious to a concrete floor which has only been laid one week after the admission of the animals, the top surface having been broken?"

Not at all, provided the concrete had been kept moist so as to become thoroughly set. Urine has no chemical action in concrete when once set.

R.I.B.A. Final Examination.

BRADFORD-ON-AVON.—G. E. P. writes: "What books are necessary to study for the R.I.B.A. final examination? I shall make Renaissance my special subject."

See the R.I.B.A. Kalendar, price 2s. 6d. nett, from No. 9, Conduit Street, Regent Street, W.

Reinforced Concrete Lintels.

BROMLEY.—W. H. S. writes: "In reference to Prof. Adams's valuable reply about reinforced concrete lintels on p. 221 of your issue for October 18th, what proportions of Portland cement to ballast or coke-breeze is to be used to suit the formula?"

The lintels should be composed of 1 part Portland cement, 1 part sharp sand and 4 parts coke-breeze or other small clean aggregate.

HENRY ADAMS.

Partitions.

BROMLEY.—W. H. S. writes: "In a certain house all the internal walls are to be 4½ins. There are ground floor, first floor, and attics in roof. The partitions in the attics are to be stud partitions. Is it expecting too much for 4½ins. to carry the inside walls up the two storeys? They would be built in grizzlies in Portland cement mortar. The longest wall without a cross-wall or a chimney breast in it is 13ft. 6ins."

Half-brick walls are not so strong for partition walls as brick-nogged partitions, unless built of hard stock brickwork in cement.

HENRY ADAMS.

At the Parish Church of All Hallows, Whitechurch (Hants), the Bishop of Dorchester dedicated on November 5th new oak clergy seats and choir seating, which have been erected from the designs of Mr. Walter E. Hewitt, A.R.I.B.A., architect, of 22, Buckingham Street, Strand, W.C., and carried out by Messrs. H. H. Martyn & Co. of Cheltenham. The chancel screen by the same architect was put up a few years ago in memory of Queen Victoria.

THE ARCHITECTS' CONGRESS.

Subjects to be dealt with.

THE following is a list of the subjects for discussion at the Seventh International Congress of Architects which is to be held in London next year from July 16th to the 21st:—

- (1) The execution of important Government and municipal architectural work by salaried officials.
- (2) Architectural copyright and the ownership of drawings.
- (3) Steel and reinforced concrete construction: (a) The general aspect of the subject; (b) with special reference to æsthetic and hygienic considerations in the case of very high buildings.
- (4) The education of the public in architecture.
- (5) A statutory qualification for architects.
- (6) The architect-craftsman: How far should the architect receive the theoretical and practical training of a craftsman?
- (7) The planning and laying-out of streets and open spaces in cities.
- (8) Should the architect have supreme control over other artists or craftsmen in the completion of a national or public building?
- (9) The responsibilities of a Government in the conservation of national monuments.

The executive committee will be glad to receive papers on any of the above subjects for presentation to the congress.

Papers may be written in English, French or German, and each must be accompanied by an abstract of not more than 1,000 words. Papers and abstracts must reach the executive committee before April 30th, 1906.

All communications should be addressed to the secretary of the committee at 9, Conduit Street, London, W.

CO-PARTNERSHIP HOUSING.

Results and Proposals.

AT a meeting of the Co-Partnership Tenants' Housing Council held at his house in Park Lane last Wednesday, Lord Brassey said this council sought to encourage the laying-out of new housing estates so as to provide for open spaces—two gardens being allotted to each house—and for the permanent social wants of the community. The object was to promote on such estates the erection, the co-operative ownership, and the administration of houses by methods similar to those of the Tenant Co-operators, Ltd., the Ealing Tenants, Ltd., the Sevenoaks Tenants, Ltd., the Garden City Tenants, Ltd., &c., which, while avoiding the dangers that too frequently accompanied the individual ownership of housing and speculative building devoid of public spirit, harmonized the interest of tenant and investor by an equitable use of the profit arising from the increase of values and the careful use of the property. In order to attain this end the council advocated the registration of societies with limited liability in building districts to acquire undeveloped building sites and to organize as shareholders in such societies possible tenants in houses when erected on the sites acquired. The council was not a commercial body, but an educational, propagandist and advisory body. In addition to the societies already referred to, others were contemplated in Birmingham, Bournville, Berkhamsted and Manchester, while interest in the scheme prevailed elsewhere. Lord Brassey said the movement had brought together £16,000 capital and £35,000 worth of property. Mr. H. Vivian (chairman of the council) said that experience at Ealing showed that the risk of not letting was practically eliminated. Of the 100 houses there contemplated about eighty were already constructed. The society had paid the

interest on capital from the start. With regard to the Garden City Tenants, it was intended to erect about 100 houses during the next eighteen months. For future extensions these two societies would require £30,000 between them, on which 4 or 5 per cent. would be paid.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following application under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:—

Buildings upon a site abutting upon the south-western side of Finchley Road and northern side of Lymington Road, Hampstead, on the application of J. D. Hunter, on behalf of W. F. Cave. (*Consent.*)

Shop and dwelling-house with stable and coachhouse at the rear, on low-lying land situated at the corner of Abbey Wood Road and Bostal Lane, Woolwich, on the application of E. J. Bennett, on behalf of Patterson. (*Consent.*)

Two blocks of dwellings on low-lying land situated at the corner of Webber Street and Barron's Place, Southwark, on the application of W. Hobern, on behalf of W. Sumpton. (*Consent.*)

Rebuilding of Nos. 133 and 135, Regent Street, on the further application of R. C. Harrison & Son, on behalf of the London Joint Stock Bank, Ltd. (*Consent.*)

Conservatory at the rear of No. 66, Holland Park, Kensington, to abut upon Holland Park Avenue, on the application of Stimpson & Chambers, on behalf of C. Wilkinson. (*Consent.*)

A church on a site abutting upon the southern side of Mitcham Road and eastern side of Rookstone Road, Wandsworth, on the application of Gordon & Gunton. (*Consent.*)

Buildings (public baths and washhouses) on a site abutting upon the north side of Scots Road and west side of Lime Grove, Hammersmith, on the application of J. E. Franck, on behalf of the Council of the Metropolitan Borough of Hammersmith. (*Consent.*)

One-storey shops and one-storey addition at the rear of No. 379, Bethnal Green Road, Bethnal Green, to abut upon Teesdale Street on the application of C. M. Shiner, on behalf of W. A. Balls. (*Refusal.*)

A building on the east side of Torrion Road, Lewisham, to abut upon the north side of Hazelbank Road, on the application of A. C. and R. A. Blake. (*Refusal.*)

A new iron and glass shelter at the Comedy Theatre, Pantion Street, and Oxenden Street, Haymarket, on the application of Gillow & Co., on behalf of the proprietors of the Comedy Theatre. (*Refusal.*)

Six houses with bay-windows on the west side of Vestry Road, Peckham Road, Camberwell, on the application of E. Crosse & Co., on behalf of G. Pedley. (*Refusal.*)

One-storey building at the rear of No. 37, Ladywell Road, Lewisham, to abut upon a passage out of the west side of Church Grove, Lewisham, on the application of G. Kimble, on behalf of F. Kimble. (*Consent.*)

A boundary wall at the "Hugh Myddelton" schools on the north side of Sans Walk, Finsbury, on the application of the Education Committee of the Council. (*Consent.*)

A workshop on the northern side of Richmond Terrace, Clapham Road, Kennington, westward of No. 90, Clapham Road, on the further application of J. A. J. Woodward & Sons, on behalf of C. Blatchford. (*Refusal.*)

A new street for carriage traffic to lead from Napier Avenue to Cromwell Avenue, Fulham, and in connection therewith the widening of portions of Napier Avenue and Cromwell Avenue, on the application of Cluttons on behalf of the Ecclesiastical Commissioners. (*Consent.*)

A new street for carriage traffic to lead from Gawber Street to Cyprus Street, Bethnal Green, on the application of the Council of the Metropolitan Borough of Bethnal Green. (*Consent.*)

An extension of the period within which the conditions contained in the resolution of 3rd September, 1903, sanctioning the formation or laying out of new streets on the east side of Wood Lane, Hammersmith, at the corner of North Pole Road, Hammersmith, were to be complied with on the application of Weatherall & Green. (*Refusal.*)

A deviation from the plans approved on 26th January, 1904, for the erection of a building on a site abutting on the River Thames and approached from Blackwall Lane, Greenwich, on the application of Mark Fawcett & Co. (*Consent.*)

Means of escape on the fifth (top) storey of Nos. 22 and 23, Fenchurch Street and No. 2, Rood Lane, City, on the application of E. B. Ellis, on behalf of Kleinwort, Sons, & Co. (*Consent.*)

New Docks at Seaham Harbour were formally opened on Saturday by Mr. A. J. Balfour. The works were designed by Mr. H. H. Wake, of Sunderland, and carried out under the supervision of Mr. P. W. Meik, of Westminster. The contract was let to Messrs. S. Pearson & Son, Ltd., of Westminster, for £378,000, and the work was begun in 1899. The main dock is 1,000ft. long, 450ft. wide and 27ft. 6ins. deep. The gateway is 65ft. wide, enclosed by a pair of storm gates, constructed of karri wood, weighing 90 tons each.

Law Cases.

Surveyors' Certificates.—In the Chancery Division of the High Court of Justice on Friday last, before Mr. Justice Swinfen Eady, an important case was heard in which the Wimbledon House Property Co., Ltd., were the plaintiffs and Mr. William Butt, builder, was the defendant, he having been engaged under a building contract dated March 1st, 1904, to erect two houses at Wimbledon on the plaintiff company's estate. Mr. Eve, K.C., M.P., and Mr. Horne represented the plaintiff company, and Mr. A. A. Scanlan (instructed by Messrs. Richard Davies & Sons) was counsel representing defendant. The facts were as follows:—Under his agreement for the erection of the houses the defendant had received eight advances, amounting in all to nearly £2,000, after the presentation of a certificate signed by a surveyor named Power. The latter's last certificate, dated November, 1904, was dishonoured by the plaintiff company, and hence this action arose. The building agreement stated that the work was to be carried out under the supervision of a surveyor, but at the trial it was contended for the plaintiff company that although Mr. Power had approved the specifications prepared by the builder and had, in fact, held himself out as their surveyor, Mr. Lancaster, the secretary of the company, was the surveyor appointed by the plaintiffs under the agreement. The point to which Mr. Scanlan, for the defendant, attached most importance was that payments had been made without demur on the part of the plaintiff company on the certificates given from time to time by Mr. Power, and he submitted that these certificates were final with respect to the amount due to the builder, citing the case of *Robins v. Goddard*, 1905. He argued that the plaintiffs had no power to refuse the advances after a certificate had been given by Power. The learned judge, however, held that the plaintiffs were entitled to succeed, and granted possession of the premises with the perpetual injunction asked for, holding that Mr. Power's certificates were given subject to the approval of Mr. Lancaster, who was said to be the plaintiff company's surveyor.

Teignmouth Reservoir Appeal.—On Wednesday last the Court of Appeal gave judgment in the case of the *Teignmouth Urban District Council v. Slocombe*. Defendant contracted to re-line, roof and divide a water reservoir for something under £6,000. Plaintiffs were not satisfied with his work, and the Official Referee awarded them £2,000. Against that decision defendant unsuccessfully appealed to a Divisional Court. He now appealed to the Court of Appeal.—Without calling upon counsel for the respondents, the Master of the Rolls said in his opinion the appeal failed. The Official Referee was of opinion that although alterations were assented to they did not relieve the contractor from putting down concrete to the depth originally prescribed of 12ins., nor did it justify him in putting down half-bricks instead of whole bricks. He also found that the bricks were not laid at all in the way prescribed. He found as regarded the concrete that both in quality and quantity the original obligation remained of good concrete and concrete of a certain depth, and he found that the concrete actually put in failed radically. The joint result of these failures, taken together, was that instead of having a good foundation for the concrete the plaintiffs had an imperfect foundation made up of half-bricks and rubbish, and that they had concrete of inferior quality. The consequence was a worthless reservoir instead of a sound one. He saw no ground whatever for the appeal, and considered it should be dismissed with costs. The Lords Justices concurred.

THE FACTS ABOUT WINCHESTER CATHEDRAL.

THE Dean and Chapter of Winchester Cathedral have received full and careful reports from Mr. J. B. Colson, their architectural surveyor, Mr. T. G. Jackson, R.A., and Mr. Francis Fox, the eminent engineer; and it is now possible to state exactly what are the facts about the danger threatening this great building. The mischief is most serious in the south wall of the presbytery, and is of long standing. During at least 400 years there has been from time to time a settlement of the east portion of the building, and the movement has been of late more marked. This is attributable partly to the insufficient buttressing of the vaulting, partly to the untrustworthy foundation—a bed of soft marl, only 10ft. below the surface, permanently washed by water, which in wet seasons rises some feet above it. The wall has been already securely shored, and Mr. Jackson advises that, as soon as it has been made solid by bonding and grouting, and the spread of the vaulting arrested, the buttresses should be underpinned on a solid stratum of gravel which has been found at a depth of 16ft. In other portions of the fabric there is a progressive subsidence little less alarming. The east wall of the south transept will also have to be underpinned on the gravel bed. And the vaulting at the east end of the crypt is in a dangerous condition. It is now supported by shores, and the central column must be underpinned. Unhappily this is not all. Though the danger caused by the subsidence is so urgent that it must be grappled with at once, there are other portions of the fabric which are seriously out of repair and must be taken in hand in the near future. The roof of the nave was thoroughly restored eight years ago at a cost of £13,000, but the roof of the north aisle and a part of the roof of the south aisle require re-leading, and the spires and pinnacles of the west front are in a dilapidated, if not dangerous, condition. All this is in the truest sense work not of "restoration" but of preservation. It is impossible to form at present any accurate estimate of what the cost will be. It will probably amount to £20,000, and a yet larger sum may be required. An appeal is therefore made for funds, which should be forwarded to Mr. W. M. Furneaux at the Deanery, Winchester, or to the hon. treasurer, Mr. Fred Bowker, jun., Southgate Street, Winchester.

NEW GOVERNMENT BUILDINGS IN LONDON.

LAST year the Royal College of Science at South Kensington, the first of the four great Government buildings now in course of erection, was finished, as far as the exterior was concerned, and is now nearly ready for occupation. This year the second one, the War Office in Whitehall, is completed—that is to say, the scaffolding is removed and the windows are in . . . Of the two remaining works, the most advanced is the Victoria and Albert Museum, which is built up to its full height, and is being roofed, while the small domes and towers are rising, and will be finished this year. The great central dome over the principal entrance, to be 150ft. high, is already 30ft. above the roof. The fourth of the new large Government buildings—the new offices for the Local Government Board at the bottom of Whitehall—has made such good progress during the year that the side opposite the Abbey is built up to its full height, and the towers here are rising, but in Parliament Street matters are not so advanced, the cornice not being yet reached, while the pediment and several other features of the building have still to be done.

Of the smaller works, the south block of the Admiralty facing the Horse Guards Parade is finished. The new processional road in the Mall has been brought on from the Duke of York's steps to the Admiralty, and a new road has been cut from the memorial across the Green Park to Piccadilly. At the Palace heavily-gilded gates have been placed in position, the lodge of Buckingham Gate has been rebuilt, and square columns for the carriageways and footpaths of each of the roads leading up to the central point where the statue will be placed have been erected.

The new Land Registry Office in Lincoln's Inn Fields is nearly ready for occupation. It is a large Gothic building of red brick with oriel windows and doorways of stone, and a low square tower at one end.

The following works have been commenced this year:—At Spring Gardens the ground is being cleared for the triumphal arch which is to bring the processional road into Trafalgar Square. After lying derelict for some years, the site of the old Civil Service Commission, by Westminster Bridge, is being utilized for the annexe to New Scotland Yard. It will be similar in style to the parent building—granite below and brick and stone above. It is already three-fourths built, and will be finished next year. The foundations of the Royal Medical College at Millbank, in connection with the barracks and military hospital there, are laid; also the foundation-stone of the new post-office building in Newgate Street. Nothing has been done about the extension of the British Museum, though the site for it was cleared two years ago.—[Extracts from the "Globe."]

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending November 10th thirty failures in the building and timber trades in England and Wales were gazetted.

- W. SAMPSON, builder, Watford. R.O. Oct. 31st.
C. G. TOWSEND, builder, Deal. Adj. Oct. 28th.
H. S. ROBERTS, architect, Rhyl. R.O. Nov. 3rd.
B. J. BATES, builder, Hedge End. R.O. Nov. 3rd.
J. WELHAM, builder, Lowestoft. Deficiency £1,775.
H. EVANS & SON, builders and contractors, St. Albans. Deficiency £484.
E. CORNER, builder and contractor, Bridlington. R.O. Nov. 3rd.
J. A. CRAIG, builders' material merchant, Southend. Liabilities £1,667; estimated assets £560.
G. W. GREGORY, builder, Sutton-in-Ashfield. Deficiency £400.
J. T. BROWN, builder, Nottingham. Liabilities £662; assets £382.
M. MORLEY, architect and surveyor, Wellington. Deficiency £900.
C. C. CROWE, timber and builders' material merchant, Tottenham and Kensal Rise. Adj. Nov. 2nd.
A. G. DEANE, builder and decorator, Reading. R.O. Oct. 31st.
A. L. GENLLOND, architect, Cherryhinton. P.E., Cambridge Guildhall, Nov. 15th, at 11.
J. A. McKAY, plumber, Sunderland. First meeting, O.R.'s, Sunderland, Nov. 15th, at 3.30. P.E., Sunderland, Nov. 16th, at 11.15.
H. PALMER, plumber, Southsea. First meeting, O.R.'s, Portsmouth, Nov. 16th, at 3. P.E., Portsmouth C.C., Nov. 27th, at 11.
E. SMITH, contractor, Edenbridge. First meeting, Swan Hotel, Tunbridge Wells, Nov. 16th, at 2.30. P.E., Tunbridge Town Hall, Dec. 4th, at 12.
TIMSON & ADAMS, builders' merchant and contractors, Leicester. First meeting, O.R.'s, Leicester, Nov. 24th, at 12. P.E., The Castle, Leicester, Dec. 1st, at 13.
T. F. CHARLES, builder and contractor, Waddingham. First meeting, O.R.'s, Lincoln, Nov. 16th, at 11.30. P.E., Sessions House, Lincoln, Nov. 30th, at 3.
A. W. FOX, painter and plumber, Great Yarmouth. First meeting, O.R.'s, Norwich, Nov. 15th, at 12.30. P.E., Great Yarmouth Town Hall, Dec. 1st, at 10.
BROWN BROTHERS, builders' merchants, Salisbury. First meeting, Bankruptcy Court, London, Nov. 17th, at 12. P.E., Council House, Salisbury, Dec. 14th, at 2.

Coming Events.

Wednesday, November 15.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS.—Excursion to Dawdon Colliery.
EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. A. Morrison on "Improvements in Plumbing and Sanitary Works," at 8 p.m.

Thursday, November 16.

CARPENTERS' COMPANY.—Mr. James Bartlett on "Setting-out Work for Acts of Parliament and By-laws," Carpenters' Hall, London Wall, at 7.30 p.m.
SOCIETY OF ARCHITECTS.—First Ordinary General Meeting at 8 p.m.

Friday, November 17.

INSTITUTION OF MECHANICAL ENGINEERS.—Meeting at 8 p.m.
BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Mr. R. Catterson-Smith on "Ornamental Design and how it should be taught," at 6.45 p.m.
ARCHITECTURAL ASSOCIATION.—Mr. J. A. Gotch on "Old Manor Houses," at 7.30 p.m.

Saturday, November 18.

JUNIOR INSTITUTION OF ENGINEERS.—Visit to Messrs. Barclay, Perkins & Co.'s Anchor brewery, Park Street, Southwark Bridge, at 2.30 p.m.

Monday, November 20.

SURVEYORS' INSTITUTION.—Junior Meeting at 7 p.m.
ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Mr. R. A. Denell on "American Methods of Erecting Buildings," at 8 p.m.

Tuesday, November 21.

ARCHITECTURAL ASSOCIATION CAMERA AND CYCLING CLUB.—Mr. E. Gunn on "The Southern Border Towns of Suffolk," at 7.30 p.m.

Wednesday, November 22.

NORTHERN ARCHITECTURAL ASSOCIATION.—Opening Meeting of Session at 7.30 p.m.
EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. J. A. Morris on "A Scottish Town," at 8 p.m.

Thursday, November 23.

BUILDERS' BENEVOLENT INSTITUTION.—Fifty-eighth Annual Dinner, Hotel Metropole, at 7 p.m.

Monday, November 27.

SURVEYORS' INSTITUTION.—Ordinary General Meeting at 8 p.m.

Tuesday, November 28.

MANCHESTER SOCIETY OF ARCHITECTS.—Mr. R. W. Orme on "Italian Renaissance," at 6.30 p.m.

Wednesday, November 29.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. T. Haddon on "A Practical Demonstration of Wrought-Iron Work," at 8 p.m.

Friday, December 1.

ARCHITECTURAL ASSOCIATION.—Mr. E. F. Reynolds on "Turkish Architecture," at 7.30 p.m.
BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Mr. J. Starkie Gardner on "Metal Applied as External Decoration to Buildings," at 6.45 p.m.

Monday, December 4.

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. E. A. Rickards on "Intention in Ornament."

Tuesday, December 5.

MANCHESTER SOCIETY OF ARCHITECTS.—Mr. J. H. Gibbons on "Some Hints on the Sketching of Churches," at 6.30 p.m.

Tuesday, December 6.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. E. Macrae on "A Tour in Belgium," at 8 p.m.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Barry.—Accepted for the erection of a small-pox hospital, for the Public Works Committee:—
H. S. Rendle, Barry £4,554

Bournemouth.—Accepted for the erection of shelters and retaining walls, &c., near Bournemouth Pier, for the Town Council. Mr. F. W. Lacey, M.I.C.E., borough engineer:—
McWilliam & Son, West Station Works, Bournemouth £3,860

Clatterbridge.—For the erection and completion of infirmary, nurses' home, receiving wards, laundry, &c., at the workhouse, for the Guardians of Wirral Union. Messrs. John H. Davies & Sons, architects, Chester:—
G. Roberts & Brother, Llandudno £10,086 0 0
G. Ellidge, Birkenhead 9,776 15 0
H. Sumpter, Chester 9,380 0 0
Brown & Backhouse, Liverpool ... 9,324 0 0
D. Davis, Cardiff 9,317 0 0
Waring-White Building Co., Liverpool 9,257 9 0
J. Thomas & Sons, Birkenhead ... 9,247 0 0
J. Hopley, Little Sutton, Chester ... 9,210 18 5
R. Allen, Birkenhead 9,206 0 0
P. Rothwell, Birkenhead 9,128 10 0
W. Moss & Sons, Loughborough ... 9,097 7 2
L. Jones, Wolverhampton 9,040 5 0
W. Flemming & Co., Neston 9,019 4 3
W. Williams, Hoole, Chester 9,012 11 10
S. Webster, Bootle, Liverpool 8,991 0 0
J. Merritt, Birkenhead 8,971 10 0
J. E. Gabutt, Birkenhead 8,860 0 0
J. Mayers & Son, Chester 8,815 15 0
W. H. Ford, Birkenhead 8,752 16 6
Hughes & Stirling, Liverpool 8,700 0 0
A. White & Sons, Liverpool 8,700 0 0
F. Matthews, Nantwich 8,652 5 2
J. Bellis, Liscard 8,595 0 0
Gerrard & Sons, Swinton, Manchester 8,555 0 0
T. Huxley, Malpas, Cheshire 8,555 0 0
Dryland & Preston, Littleborough 8,250 0 0

* Accepted.

Crook (Durham).—For the whole of the work required in extensions to the Co-operative Store, Crook, and stables, loose-boxes, &c., for nineteen horses. Mr. F. H. Livesay, architect, 107, Newgate Street, Bishop Auckland:—
Davison & Bolam, Blaydon-on-Tyne £2,817 0 0
W. Lister 2,717 0 0
H. C. Howe, West Hartlepool 2,685 3 8
G. C. Young, Stanley, Crook 2,632 2 0
P. C. Scott, Darlington 2,628 14 0
W. Walton 2,560 0 0
G. Lax 2,557 0 0
W. Matchell 2,547 0 0
J. Kyle & Son, Barnard Castle 2,540 0 0
R. Wilson, Barnard Castle 2,500 2 11
T. Atkinson, Coundon 2,497 0 0
T. Walton 2,449 16 6
Wright & Freeman, Welbeck Road, Byker, Newcastle-on-Tyne 2,176 10 0

* Accepted. [Rest of Crook.]

Hampton.—For the erection of a new public elementary school for 800 children, for the Middlesex Education Committee. Mr. G. E. T. Lawrence, architect, Buckingham Street, Adelphi, W.C.:—
J. Barker & Co. £12,112
J. Ward & Son 11,931
Goddard & Sons 11,829
T. J. Messom & Sons 11,675
T. H. Kinglerlee 11,229
G. Godson & Sons 10,944
F. G. Minter 10,757
Patman and Fotheringham 10,728
Wisdom Brothers 10,609
Fassnidge & Sons 19,518
D. D. Neale 10,439
C. F. Dickens 10,385
W. J. Dickens 10,294
A. & B. Hanson 10,253

J. Dorey & Co. £10,192
Fairhead & Son 10,106
H. Knight & Son 9,432

Henbury.—For the erection of a new police-station and petty sessional court at Henbury, near Bristol. Mr. R. Phillips, county surveyor, Gloucester:—

A.—Police station.		B.—Petty sessional court.	
E. Browning	£3,008 10 0	£1,557 0 0

OUR METHOD

OF ADVERTISING

A "WANT"

not only brings results, but it saves you expense.

We give three insertions of an advertisement for the price of two, and in addition we tabulate the particulars you send under a special heading in the Employment Register, and keep it there for *six weeks* free of any extra charge.

Thus for 3s. a four line advertisement appears in two places in our paper, and your "want" is advertised for six weeks.

We know this is generous treatment, but we think when a man is out of a situation it is a time when a little generosity is appreciated. The letters we have already received from those who have taken advantage of this scheme point clearly to the truth of this, and we are glad to know that the Employment Register has already helped many to find good positions.

The only condition we make is that immediately an appointment is obtained we are advised in order that we may take the number and name off the Register, thus saving waste of space.

All advertisements for next week must reach this office not later than 5 o'clock on Monday, the 20th inst.

The Employment Register in this number appears on page xx.

The Three Builders' Journal Insurance Schemes are—

- (1) A Free Accident Insurance of £500.
- (2) An Accident Insurance of £500.
And also
£250 for Permanent Total Disablement.
£2 10s. per week for Temporary Total Disablement.

Premium, 1/-

(For the conditions under which policies Nos. 1 and 2 are issued readers should refer to our pamphlet, sent on application.)

- (3) An Accident Insurance of £1,000,
£500 for Permanent Total Disablement,
£6 per week for Temporary Total Disablement,
with special advantages.

W. Lawrence & Son	4,974
Knight & Son	4,820
J. Dorey & Co.	4,799
W. J. Renshaw	4,765

Mr. A. A. Paterson, architect, has in hand the new additions to the municipal buildings at Helensburgh, the total outlay on which will be £6,000.

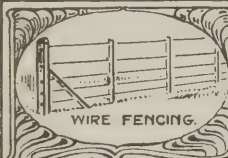

Colonial House, Liverpool, the large block of new offices for Messrs. Elder, Dempster, & Co. at the corner of Water Street and Tower Gardens, has been opened. The building has a total frontage of 284ft., and is built of Cefn stone, with granite pillars. The office staff department is 140ft. by 70ft., lighted by seven domes.

Proposed Subway at Tunbridge Wells.—At Tunbridge Wells it is proposed to form a subway 53ft. long under the South-Eastern Railway from the Upper Grosvenor Road to the east end recreation ground.

Villa Asylums.—The villa system is to be adopted by the Hoddington Lunacy Board. Each villa is to accommodate thirty-five patients. The estimated expenditure works out at £100 per bed, exclusive of heating (£20 more per bed), lighting and painting.

A South African War Memorial at Gateshead, in Saltwell Park, was unveiled on Saturday by Lieut.-General Sir John French. It was designed by Mr. F. Doyle Jones, of Hartlepool and Chelsea, and is surmounted by a bronze figure of "Peace crowning the heroes."

Fears for the safety of the Tower of Cripplegate Church, which is nearly 800 years old, have lately been entertained. Expert opinion has been taken, and while there is no reason for serious apprehension, the stonework, which is a facing of Kentish rag, is crumbling away. A scheme is about to be devised for re-facing the tower.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

November 22, 1905. Vol. 22, No. 563.

6, Great New Street, Fetter Lane, E.C.

Summary.

In the paper on American methods of erecting buildings which he read before the R.I.B.A. on Monday night, Mr. R. A. Denell ascribed differences in practice to changed conditions, and thought that "skyscrapers," which had caused somewhat of a revolution in building methods, were simply the outcome of commercial evolution. (Page 301.)

A number of architects have petitioned the Institute to hold an open competition for their proposed new premises. (Page 300.)

A big competition is likely to be held for the proposed extension of the Birmingham Council House, to cost £137,000. (Page 300.)

The Edinburgh Architectural Association in connection with the Brooklyn Museum of Arts and Sciences proposes to issue a five-guinea volume on architectural refinements, comprising 250 plates. (Page 298.)

A correspondent raises the question of the employment of foreign fireproof floors in buildings on Crown property. (Page 299.)

The old foundations of St. Mark's Campanile at Venice have been added to and cut into, with the result that there is only a nucleus of old work in the centre of the new tower. 3,076 larch piles have been driven. These are calculated to have a total bearing capacity of 90,000 tons. The weight of the new tower is estimated at 20,000 tons. (Page 290.)

Mr. Gotch read a paper on "English Manor-houses" before the Architectural Association last Friday. Speaking of the time when the Italian influence began to be felt, he said the actual causes of the change of style in mediæval times had never yet been thoroughly explained. How was it that within ten or fifteen years the forms given to the ornamental parts of buildings should have altered so completely as to constitute a new and distinct style, and that the change should have affected work over the whole country at the same time? (Page 294.)

Huge new law courts are being erected in Rome. They are the outcome of a competition held as far back as 1885, and are likely to cost £1,316,000 when complete—in 1908. (Page 290.)

Gas-producer plants for builders are rapidly winning favour. Indeed, there can be little doubt that for moderate loads—say, from 20 to 200 horse-power—this form of energy has an immense future. It is claimed that, under ordinary working conditions, power may be produced at from $\frac{1}{2}$ d. to $\frac{1}{4}$ d. per brake-horse-power hour. (Page 299.)

External Treatment of Basements and Ground Floors.

In Renaissance work the treatment of the basement of a building received the careful consideration of architects. Basements included the lower horizontal division of an elevation, and might include two storeys, while even with one storey this might be what we now call the ground floor. By virtue of its position the lower portion of an elevation seems to need some emphasis so as to give that appearance of strength necessary to sustain the upper floors. In Renaissance design this becomes of increased necessity when columns or pilasters make up the façade and the upper treatment is of an elaborate nature, requiring some simpler treatment below to give a restful effect. An appearance of strength is generally given by rustication of the masonry, such as vermiculating the surface or using rough-hewn blocks. We have already taken objection to vermiculated work, because of its worm-eaten appearance, its facility for collecting soot and the subsequent sure decay of the stone. Rough-hewn or axed work is very suitable, as it is economical, while the unevenness of surface breaks up the light falling upon it and gives a feeling of greater strength than can be obtained by any other means. The reason of this effect is probably due also to the display of the texture of the stone, from which the mind instinctively grasps the strength of the material. If, however, the treatment of the elevation does not require so much emphasis, sufficient strength of appearance can be obtained by sharply defined lines of joints and the use of large blocks. Windows are frequently made smaller and fewer, and not emphasized more than necessary by surrounding mouldings. Still, another treatment has been adopted recently, namely, the use of a stone of stronger structure, such as granite: the granite, however, is often polished, and this destroys the effect. If granite is intended to give an appearance of strength it must be unpolished. But there is another treatment which has not been much adopted, namely, to add strength by means of colour, such as the use of a darker stone or a stone of stronger colour. It is often inadvisable to use rough masonry, especially in towns with smoky atmospheres, where decay and dirt in a few years produce a distressing effect. Where expense may forbid the use of granite, then we suggest recourse to the use of a stone of a different colour.

The Roaming Assistant.

READERS will recollect that the late Mr. Alfred Waterhouse bequeathed a number of legacies to the assistants who had been with him at one time and another throughout his distinguished and busy career, and very general appreciation of the man's generosity has been expressed. It is not often that architects' assistants are rewarded in such a way and some recognition is made of the services which they have rendered to their principal. We note in this connection that one of our American contemporaries takes occasion to point out what a roaming item the modern architectural draughtsman has become by reason of the strenuous times in which we live—times which compel architects and builders to do their work at a speed which the world has probably never seen before. Our contemporary observes that formerly a draughtsman, once he had proved his ability, felt that he was a fixture in his employer's office just so long as his own inclinations were satisfied. "Nowadays, however, most draughtsmen know that they are not engaged by the year or even by the month, but almost always and merely 'by the job'; and when the job is finished and they are once more thrust out into the stream of their fellows, ever seeking another job, they hardly perceive with how real an inhumanity they are being treated, an inhumanity their recent employers in many cases did not themselves experience. The consequence is that the draughtsman of to-day is, and must be, a permanent member of the country's floating population, to the detriment of his own happiness and the injury of his moral and business well-being. It is unfair and unjust, but so far as we can see the situation has but a single cure, and that is so radical a one that we hesitate to express our views." Like the writer of the thrilling serial, our contemporary here breaks off and leaves us tingling to know what it would do. Instead of telling us that, we are merely left with the reflection, based on the late Mr. Waterhouse's gifts to his assistants, that "evidently life in England is, even to-day, less strenuous than it is here." Probably that is so, but then there are not enough bequests to go round, and we are sure the many thousands of assistants in architects' offices in this country will agree that even in drowsy England life is not all sweet and quiet, with never a prod to remind them that they are part of the floating population. The problem of the unemployed has many phases.

THE HUGE NEW LAW COURTS IN COURSE OF ERECTION AT ROME: TOTAL ESTIMATED COST, £1,316,000. SIGNOR CALDERINI, ARCHITECT.

NEW LAW COURTS AT ROME.

A VERY large building in Rome—the new Law Courts—is being erected. The design was secured in competition. First a competition was held in 1883, but none of the designs sent in were considered suitable, and a second competition was held two years later, in which Signor Calderini was successful. In 1889 the building was begun. It had been fixed in a law of 1885 that, exclusive of bas-reliefs, statues and frescoes, the cost of the work should be approximately £320,000. As a matter of fact, says the Rome correspondent of the "Morning Post," Signor Calderini's accepted estimate for the whole work was £1,080,000, and even that enormous sum has been quite inadequate. The whole of it had been spent by last year, when the Giolitti Cabinet applied to Parliament for a supplementary vote of £236,000, to be spread over the four years 1904 to 1908, by which time—a quarter of a century from its inception—it is hoped that the building will be finished. Thus, from first to last, the Palace of Justice will have cost the nation £1,316,000. The building occupies a commanding position on the right bank of the Tiber, exactly opposite the new Ponte Umberto I. In the courtyard four seated statues are seen, representing Licinius, Julianus, Modestinus and Gaius, while behind them are figures of Cicero and Papinian; above, along the front of the Palace, fourteen medallions contain portraits of great jurists of more modern times; over the doorway is Justice, enthroned between Law and Force; and above this large group two stone wolves, nourishing Romulus and Remus, personify the legendary foster-mother of the Romans. All round the building runs a frieze of bulls' heads, with here and there a lion's head above the frieze, while inside there are eagles in plenty. There is an inner court, also adorned with four sitting statues, above which will be placed a colossal statue of the Law. On the ground floor are three assize courts and four other tribunals, but there is an immense waste of space in corridors, passages and courtyards, and the result has been to make the actual courts unduly small. One great advantage, however, which the Italian Courts will possess is in the admirable lighting and ventilation and the heating arrangements. A fine double staircase ascends to the first floor, on which are situated the court of appeal and the Corte di Cassazione, while on the

second floor are a large library (one of six scattered about the Palace) and six civil courts. Three kinds of stone have been used for the building—that of Brescia for the staircases and that of Tivoli and Cività Vecchia for the outside work. Of the interior decorations it is too early to judge, for the painting of the frescoes is only just beginning.

ST. MARK'S CAMPANILE.

The Construction of the new Foundations.

AN authoritative article on the foundations of St. Mark's Campanile at Venice, by Mr. Horatio F. Brown, appeared in the "Times" for Thursday last. The foundation work is rapidly approaching completion, and it is hoped to begin the building of the new tower in January next. When it had been decided to rebuild the campanile after the fall on July 14th, 1902, considerable discussion arose as to what should be done with the old foundations, some authorities urging their entire removal and substitution by new foundations, and others (on the fact that the collapse was not attributable to any weakness of the old foundations) that they should simply be enlarged to suit the new tower. The work actually carried out is a compromise between these two contentions. A ditch about 16ft. deep and 12ft. wide was dug all round the old foundations and carefully bratticed, and into this area were driven 3,076 larch piles, fresh cut so as to ensure abundant resin. The average diameter of the piles is 8½ ins. and the average length 13ft. They were driven home to almost absolute resistance, that is to say, till they yielded only 1 millimetre to each blow from a weight of 570 lbs. raised 4ft. 6ins. They are calculated to have a carrying capacity of 30 tons each, giving a total carrying power of about 90,000 tons; the weight of the tower they are to support being estimated at 20,000 tons. The driving of these 3,076 piles was a slow process. It was carried on by the primitive method of hand-rope and pulley and weight; eleven ropes and eleven hands to each pile-driver. Day after day all through the summer, from behind the palisade that hid the works, came the long monotonous drone of the foreman giving the time to his hands.

At length on October 8th, 1904, the initial step of pile-driving was completed; and

having now reached the level of the old platform the question of bonding the new work into the old came up for consideration. The new platform had to be superimposed upon the old, and this led to the latter being cut into for a depth of 8ft.; the new platform in its upper layer was then laid on the top of the old, a union which, says Mr. Brown, is neither complete nor quite satisfactory. The new platform, like the old, is made of two layers of oak beams, fresh cut. The lower layer runs parallel to the sides of the foundations, the upper is laid across; but at each angle there is a third layer, placed in the form of a fan of seven sticks, an ingenious device by which the pressure at the angles is distributed over a wide area. The layers are fastened together by pins of dog-wood, and the interstices filled in with cement and chips of the porous Monselice stone. The question of bonding the platform has virtually decided the fate of the old foundations, for the incision of 8ft. all round means 19½ft. of new foundations in every direction, and leaves only 200 cub. metres of the old foundations as a mere nucleus in the centre of the new tower. On the top of the new platform come massive blocks of Istrian stone in eleven courses, stepped inwards. These blocks are bonded into the old foundations to the depth of 6ft. 6ins., the largest blocks being 9ft. 9ins. long and 4ft. 7ins. wide; so that, as a matter of fact, the new campanile will rest almost entirely on new foundations and a new platform, while its weight will be borne partly by new and partly by old piles. As regards cost, it is likely to be well within the £8,000 estimated for the construction of the new foundations.

Housing the Very Poor.—In Dublin last week the first block of buildings erected by the recently-founded Association for the Housing of the Very Poor was formally opened by the Lord Mayor at Sumner Street, on the south side of the city. This block comprises 116 tenements, two shops and men's reading-room; but it is the intention to proceed with the second portion on the east side of Sumner Street—comprising 138 tenements, baths and washhouses—as soon as the requisite funds have been obtained. The entrances from the street and staircase give access in each block of the dwellings to two tenements on each floor and two in the rear. The rents vary from 1s. 6d. to 2s. per week. Mr. Arthur Dudgeon is the architect and Mr. J. B. Pite the contractor.

SOCIETY OF ARCHITECTS.

Presidential Address.

THE opening meeting of the session of the Society of Architects was held on Thursday last at Staple Inn Buildings, Holborn, when the new president (Mr. A. E. Pridmore, F.S.I.) delivered his inaugural address. In connection with a summary of the inception and history of the Society (which was founded in 1884) Mr. Pridmore dealt with

The Question of Registration.

He said a representative body of architects met in London in 1886, when it was determined that it would be in the best interests of the profession to make it compulsory for all architects to hold a Government diploma, and that a committee should be formed to consider the best means to obtain an Act of Parliament for that purpose. A circular was then issued to about 2,500 architects practising in the United Kingdom, with a request to sign, if they thought fit, a declaration in favour of obtaining legislative powers making it obligatory that all persons thereafter entering the profession should be duly qualified by examination. About 1,300 favourable replies having been received, the "Architects' Registration Bill Committee" was formed, by whom a Bill was introduced into Parliament in 1887 which included architects, civil engineers and surveyors. The two latter professions raised certain objections, and a fresh Bill was introduced dealing only

with architects. The Society, said Mr. Pridmore, had been most persistent and energetic in its attempts to secure registration, and Bills had been introduced from time to time—the last having been set down for second reading in the last session of Parliament, but owing to pressure of public business unfortunately was not reached. In December, 1902, the Architects' Registration Bill Committee was amalgamated with the council of the Society of Architects as a general registration committee under the chairmanship of the president of the Society for the time being. It had since been ascertained that about two-thirds of the members of the profession had declared themselves in sympathy with the movement for obtaining the statutory examination and registration of all persons entering the profession.

Various Matters.

The president then proceeded to refer to various matters connected with the Society, such as the library, municipal engineers and surveyors, &c., particulars of which will be found in the annual report (see page 238 of our issue for October 25th).

Speaking of the financial condition of the Society, he said that seven years ago they had a deficit of £150, while now there was a reserve fund of £1,100.

The London Building Acts (Amendment Act) of 1905

called for his attention. This was proposed to come into force on January 1st, 1906, and was a modest measure of about forty-three

sections, instead of the 196 included in the first proposed Bill. Its effect was limited to the provision and maintenance of proper means of protection and escape in Metropolitan buildings in case of fire, and he thought it would be admitted that the promoters of the Act had reasonably dealt with the requirements of the public.

It was, however, clear that when that Act came into operation next year property owners and others interested in buildings throughout the Metropolis would be compelled to incur considerable expense in carrying out the requirements of the London County Council.

The president then proceeded to give advice to students, urging the importance of draughtsmanship, geometry and the knowledge of materials, and then went on to speak of

London Street Improvements.

One of the most important improvements deserving immediate attention was, he said, the main thoroughfare connecting the north of London with the City at the north end of Bishopsgate Street Without. Part of this improvement had been carried out by the clearance of numerous dilapidated houses in order to permit the erection of the terminus buildings of the Great Eastern Railway at Liverpool Street, which resulted in the thoroughfare being partially widened, but not right through. The remaining houses should be removed, as they were a source of danger to traffic. Constitution Hill

Devereux Court, Temple.

The Lych-gate, Penshurst, Kent.

DRAWN BY MISS ETHEL WILLIAMSON.

should be widened to the same width as the Mall.

The Proposed Westminster Improvement was not far-seeing, as there might be a time when even the Houses of Parliament would require extra buildings; therefore the Victoria Tower Gardens should be continued the same width along the new Embankment, skirting the Thames as far as Horseferry Road. Further, Horseferry Road might in the future become a main thoroughfare, in conjunction with the Lambeth Road on the Surrey side, and 50ft. was insufficient. It should certainly be nearer roof, in width than 50ft., and Lambeth Bridge should be reconstructed during the next decade to conform with the streets on either side of the river. It should be made one of the most important bridges of the Metropolis, thereby

relieving the traffic over Westminster Bridge and beautifying the surroundings of the Houses of Parliament.

Proposal to take down St. Clement Danes Church.

Mr. Pridmore said he was opposed to the widening of Blackfriars Bridge by adding a few feet to it, as done with London Bridge. A new bridge was necessary to cross the river at Temple Pier about midway between Waterloo and Blackfriars Bridges, with a street to the central entrance of the Law Courts in the Strand one way and a street to St. George's Circus, Southwark, the other; this would link up with Aldwych; but to carry this scheme out in its entirety the church of St. Clement Danes, which was externally far from pleasing and stood awkwardly in the road, should be taken

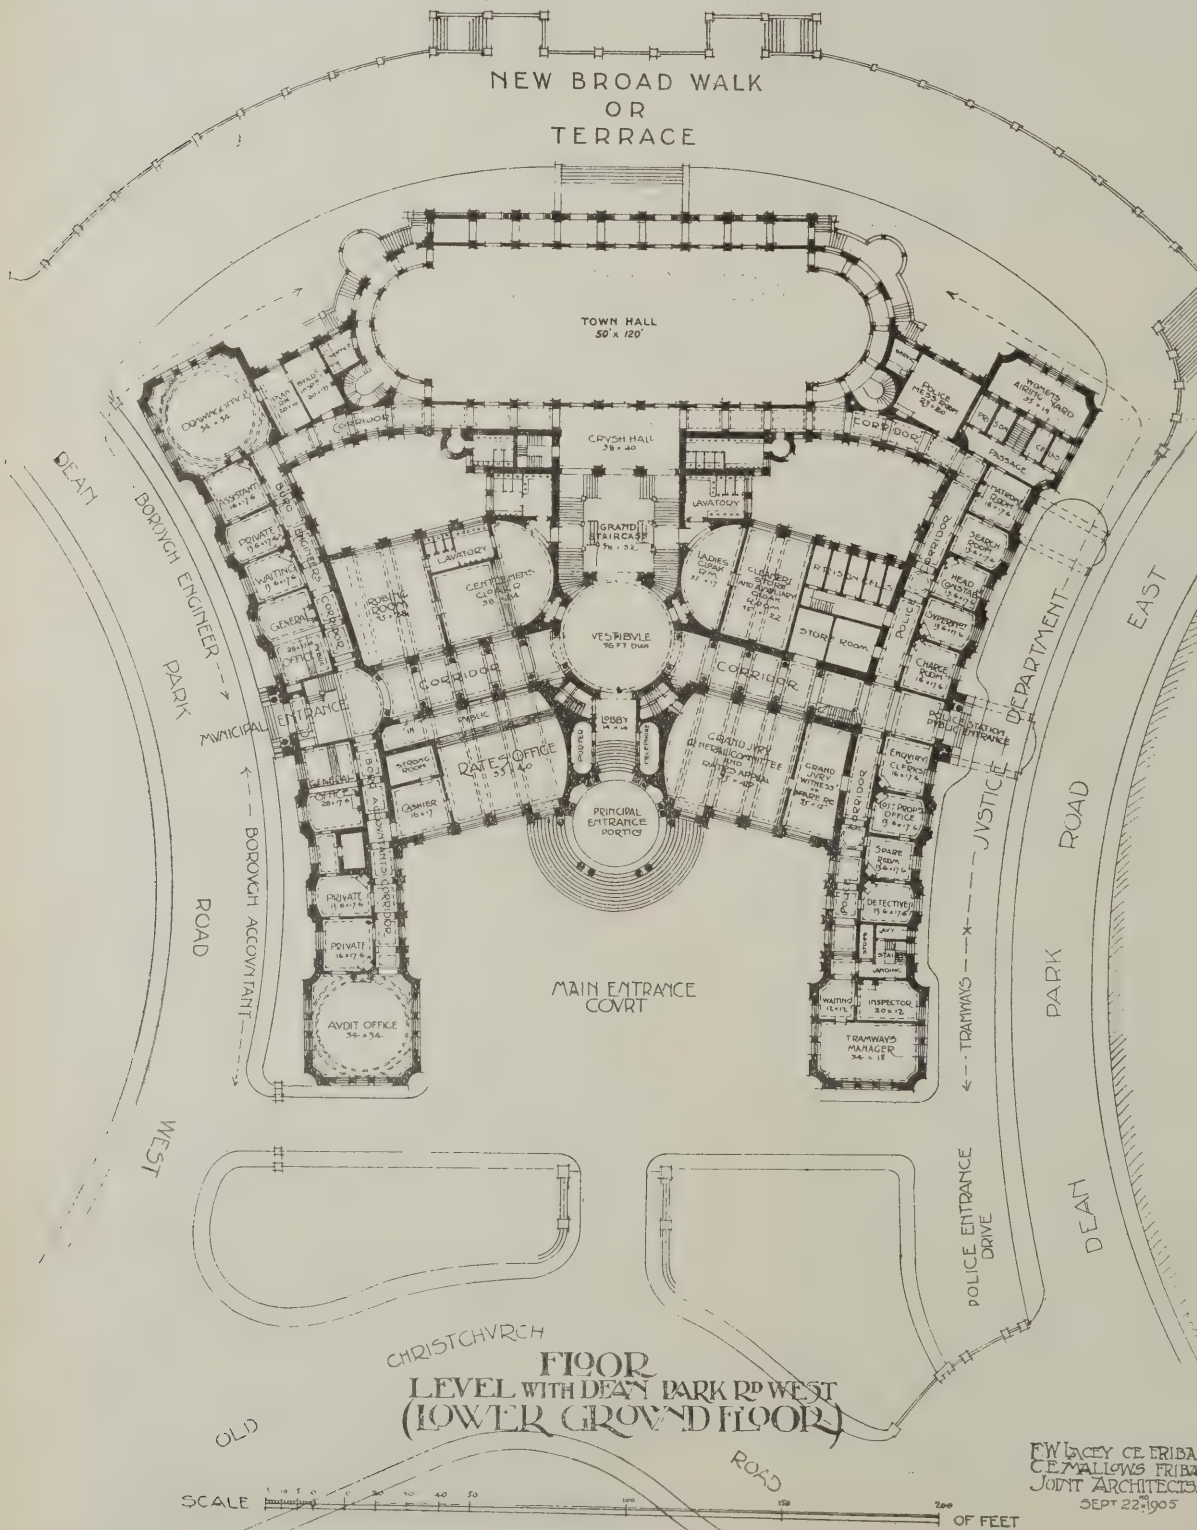

down, retaining the tower. London was seriously underbridged, and new bridges should be erected, and architects appointed to assist in designing the architectural features and details of them.

BOURNEMOUTH MUNICIPAL BUILDINGS.

WE illustrate herewith the design for proposed municipal buildings, law courts and town hall for Bournemouth which has been prepared by Mr. F. W. Lacey, C.E., F.R.I.B.A., borough engineer of Bournemouth, and Mr. C. E. Mallows, F.R.I.B.A., of London. The scheme shown has been approved by the Bournemouth Town Council, and has now only to go before the Local Government Board.

The site proposed is an irregular one with frontages to Dean Park Road West, Christchurch Road and Dean Park Road East. The varying levels of the ground have afforded an opportunity (which is quite unique) of planning a building in such a manner that three distinct ground-floor levels are obtained, each with a separate entrance from the street. At the northern end it is proposed to form a new broad walk or terrace, from which access is given to the town hall. The law courts are placed upon the east side of the building and the municipal buildings on the west side, the principal entrance being arranged in the centre of the front facing Christchurch Road. The entrance to the municipal buildings is in the centre of the Dean Park Road West elevation, and is also an additional entrance to the council-chamber, reception hall and committee rooms on the first floor. The main entrance to the law courts is also centrally placed on the Dean Park Road East elevation. Two large courts are planned on the ground level on either side of a wide corridor leading to the circular reception-room above the vestibule, the various other rooms for witnesses, &c., being conveniently placed along the front, with a corridor behind.

The police-station is planned beneath the law courts group, as shown by the accompanying plan. The work is estimated to cost £78,000 for the municipal buildings and law courts, and £48,000 additional for the town hall.

PROPOSED MUNICIPAL BUILDINGS, TOWN HALL AND LAW COURTS FOR BOURNEMOUTH.

DESIGN FOR PROPOSED MUNICIPAL BUILDINGS, TOWN HALL AND LAW COURTS AT BOURNEMOUTH. F. W. LACEY AND C. E. MALLOWS, F.F.R.I.B.A., JOINT ARCHITECTS.

THE ARCHITECTURAL ASSOCIATION.

Mr. Gotch on English Manor-houses.

A MEETING of the Architectural Association was held on Friday evening at 18, Tufton Street, Westminster, the chair being occupied by the president, Mr. E. Guy Dawber, F.R.I.B.A.

The following were elected members of the Association:—Messrs. Winter Rose, Philip E. Webb, J. W. Jarvis, A. C. Bridger, H. L. Kiddle, J. Seddon, B. Clough Williams Ellis, H. G. Taylor, J. E. Henderson, R. C. Adamson, R. W. A. J. Cosway, G. W. Goslin, W. H. Hatchard Smith and G. Flint Clarkson.

The following further donations to the building fund were announced:—

	£	s.	d.
H. P. G. Maule (2nd donation)	-	-	5 5 0
C. R. R. Clark	-	-	2 2 0
F. S. Chesterton	-	-	1 1 0
W. Dewes (2nd donation)	-	-	1 1 0
H. White	-	-	1 0 0
F. T. Baggallay	-	-	0 10 6
C. H. Brodie	-	-	0 10 6
A. E. Bullock	-	-	0 10 6
A. O. Collard	-	-	0 10 6
W. J. Davies	-	-	0 10 6
H. T. Hare	-	-	0 10 6

The president proposed a vote of thanks to Professor Henry Adams for a donation of several samples of wood and stone to the Association, after which he announced that he would be "At Home" at 18, Tufton Street on December 8th, at 8.30 p.m., when an exhibition of work done by students during the summer would be held.

Mr. J. A. Gotch, F.R.I.B.A., F.S.A., then read a paper on "Old Manor-houses"—not necessarily manor-houses in the technical sense of being the dwelling-place of the lord of the manor, but rather those of medium size and importance, of which the ordinary manor-house is the type.

There were many houses of the kind in existence even in the days which we are accustomed to picture to ourselves as being dominated by castles. But a great number of them have disappeared, having been replaced in many instances by more modern dwellings.

Consequently, early houses are not very numerous, and most of those which have survived have undergone frequent alterations. It is therefore difficult to find examples of untouched domestic work. Nevertheless, by comparing one fragmentary specimen with another, it is possible to ascertain what were the main lines upon which they were built.

The General Arrangement.

Many of them were not strongly fortified, even in the turbulent times of the Edwards. They were arranged with a view to defence, it is true, with thick walls and small windows, but it was defence from a casual attack and not from a set siege. They were generally surrounded by a moat, and the stronger ones were furnished with a drawbridge and portcullis; but many of them had merely an ordinary bridge and a strong door. The larger sort were built round a courtyard, which was entered either through a gateway in the house itself or through a gatehouse set in a wall of enclosure. These early dispositions, which took their rise from the necessities for defence, were retained long after the need for such precautions had disappeared; and, without any conscious endeavour on the part of the builders, they added piquancy and interest to the composition.

Were the Old Houses the outcome of Careful Design?

An interesting speculation which suggests itself is how far were these old manor-houses the outcome of careful and pains-taking design? How much was there of intentional composition in the grouping of their parts? The answers to these questions would probably be found to be "Not very

far" and "Not very much." There was, we must remember, a particular style in vogue at each period and a particular type of plan. Half the difficulty of the present-day designer, therefore, was removed at once, or, rather, it never arose. The wants to be supplied were simple, and so also were the means of supplying them. There were a few well-recognized apartments which had to be provided in every house; if more accommodation were required it was added in the simplest way and without much endeavour to harmonize it with the rest of the building. Hence, the planning of many old houses is very haphazard, with the result that their appearance is picturesque; but it may be doubted whether the designer aimed intentionally at a picturesque effect. In fact, half the delight which these old houses inspire arises from their unstudied beauty; they look as inevitable as a natural growth. The masons had their traditional methods of solving the simple problems with which they had to deal, especially as regards the smaller and less pretentious houses. In those of more importance a greater foresight was often exercised, and where a "surveyor"—or, as we should now style him, an "architect"—was employed a good deal of skill was displayed. No one can examine John Thorpe's drawings, for instance, without coming to the conclusion that he was a very ingenious planner and always bore in mind the outward effect which the disposition of his various rooms would produce.

Stone the Predominant Material.

But now let us consider in detail some old manor-houses of various dates and from all parts of the country. We shall see how much they have in common, and yet how widely different they appear, owing largely to the materials of which they were built. They were naturally influenced in great degree by local conditions. Most of them are built of stone. Where stone was not readily procured, the walling was perhaps of brick or of timber and plaster, but even then stone was used for the ornamental portions; not so much in half-timber work, because the wood was easily worked. But, in regard to brick, and its ally terra-cotta, although they furnish some fine examples in certain districts, yet in point of number they are comparatively insignificant. They occur chiefly in the southern and eastern counties, and even there the mouldings of the windows and doors will sometimes be found to be worked in plaster or cement in imitation of stone.

The first example which we shall consider is

Longthorpe Tower.

situated in a small village of that name about two miles west of Peterborough, the village of which Thorpe Hall is now the principal house, a fine and interesting specimen of the work of Inigo Jones's son-in-law, Webb. The tower is of very different character from the Hall. It was a country-house of the abbots of Peterborough, built for peaceful purposes, but made of sufficient strength to render it secure against casual attack. There is not much left of the original building besides the tower and the end of an apartment which may have been the hall. This is of Early English date, and may be put at about 1250. What the original accommodation may have been is a matter for conjecture; but it probably consisted of a hall, the tower, in which the abbots' private rooms were placed, and some kitchens which have disappeared, possibly because they were built of wood. The house has undergone many alterations. At the end of the limb, which was presumably the hall, there is a fifteenth-century window on the ground floor and a seventeenth-century window above it. There is also a wing of the latter date, and a further addition of modern times. In fact, the house shows signs, like nearly all ancient dwellings,

of continuous occupation and continuous changes to meet changing conditions.

The Most Interesting Part

is the tower itself, which is a Midland version of the northern peel-towers. It consists of only three floors, whereas in the towers of the north of England and south of Scotland there are usually five floors; but it must be remembered that northern peel-towers were generally self-contained and had no adjoining apartments. The ground floor here is provided with extremely small windows, only 4ins. wide; the other two floors, being less accessible from outside, have windows of more cheerful size; but even in the case of the middle storey, which was the chief apartment, it was considered necessary to enlarge the original windows in the seventeenth century. The lights of the two lower storeys are glazed, and it is not impossible that those of the principal room were glazed from the outset, but glass was far too great a luxury to be bestowed upon inferior rooms, and in those days all but the most important windows were provided with nothing more than shutters. The windows of the top floor at Longthorpe have clearly never been glazed from the outset to this day, and it is needless to say that the room is not used for domestic purposes. The ground-floor room was approached from the adjoining building, and so also was the room above it; but access to the topmost room was gained by a narrow staircase in the thickness of the wall, and from this room a second staircase wound round a newel up to the battlements of the roof. The ground floor was merely a cellar or store-place; the first floor, which alone has a fireplace, was the solar, or lord's private room; while the room over it was probably devoted to his retainers as a sort of watch-tower. In this room there is a latrine in the thickness of the wall.

There were probably some outer defences to the house, but, if so, they have entirely disappeared, including the moat, which must almost certainly have existed.

The next house in point of date is

Woodcroft Castle.

not far from Stamford. This presents features which are absent from Longthorpe, but lacks others which exist there. For instance, there is no ancient staircase, nor any sure indication of where it was. The whole place has been more drastically remodelled inside, and restoration (necessary no doubt) has played havoc with the ancient arrangements. On the other hand, the moat remains, and the entrance gateway, as well as the chapel above it. Although called a "castle," the house was nothing of the kind; it was not even strongly fortified, since there are no indications of either a drawbridge or portcullis. It depended upon its gates for preventing unwelcome access, and upon its moat, its thick walls and narrow windows for security in other respects. It seems to have been of much greater extent originally, and to have occupied most of the area enclosed by the moat. Of the remains left not many rooms can be identified with certainty. There is no doubt, of course, about the archway, which was the entrance; the small room on its right was probably the porter's, and the large one on the left was perhaps the guard-room. There is nothing to show where the hall and kitchens were. It is equally certain that the room over the archway was the chapel, since the piscina still remains; and there was a gallery over part of the chapel, as indications exist of the gallery front and of the stairs of access.

The round tower, which has survived, was balanced by another at the other end of the front, which has completely disappeared, but it is impossible to say whether there was a tower at each of the other corners. The whole treatment of the place has a somewhat unfamiliar air, and it is quite

possible that a foreign architect (shall we call him?) may have been sent from the Abbey of Peterborough, which is not very far distant.

This place also has work of different periods. The original house was built in the closing years of the thirteenth century; the east wing was either built or remodelled in the fifteenth; the chapel was made into a living-room in the seventeenth; and in the nineteenth many evidences of its previous history were blotted out.

Kirby Muxloe.

Nearly two centuries had elapsed before the next house of our series was built. It is at Kirby Muxloe, in Leicestershire, and is again wrongly called a castle. Castle it was not, but a fortified dwelling-house, rather more carefully fortified than the former examples. Unlike them, it was not in continuous occupation for very long; there is no history attached to it, nor are there any contemporary records to throw light upon its origin or decay, but judging by the excellent preservation of the little moulded work which has survived, it could not have been subject to the wear and tear of daily life for any great length of time. Unlike them, too it is built of brick, but its mouldings are of stone. There is not an abundant supply of stone in that district, and what there is is hard to work; accordingly, the detail is large in scale. The actual remains of the house are not extensive, but the outline of the walls can still be traced, and they indicate that it must have been of considerable size. It was surrounded by a moat which washed the walls on every side, and the main disposition was almost truly symmetrical. This fact is interesting in view of the dominating part which symmetry played some centuries later when the Italian influence was becoming paramount in English design. The gatehouse is the most important feature left. This consists of an archway, with a porter's room on each side, the whole being surmounted on the next floor by a large guard-room. There was a drawbridge and a portcullis. The recess into which the former was drawn up and the holes for the chains which raised it are plainly visible. So also are the grooves for the portcullis and the recess in the wall of the guard-room which contained it when elevated. These means of passive resistance were supplemented by others of an active kind, for in the flanking powers are circular orifices, through which the muzzles of cannons were thrust, a method of defence of which there are not many examples to be seen of this date, which is about 1480. The red brickwork is ornamented in places with a diaper of blue; a fashion which became very prevalent during the next century. Among the patterns which a patient scrutiny reveals are the letters "W. H." and a heraldic "manch," the initials and cognizance of William Lord Hastings, who, if tradition can be believed, built the house for the celebrated Jane Shore. It may be so, and in that case the strength of the defensive works seem to indicate that his lordship, having got the lady there, intended to keep her.

Of about the same date, but rather earlier, is

The interesting Manor-house of Stoke Albany.

in Northamptonshire, which, again, is only a small half of the original house. Its principal features are the windows, buttresses and entrance door on the main front. The doorway is a well-moulded pointed opening, surmounted by two shields of arms, the forerunners of the heraldic displays with which the Elizabethan designers loved to adorn their porches.

To the Gothic period belongs also the quaint fireplace of a small farm-house in Somerset called Churchill Park, where the great oak beam is cut to form a flat-pointed

arch and is panelled with quatrefoils and cusps.

The Cause of the Mediaeval Changes never yet explained.

So far, the houses which we have examined have all been Gothic in their treatment. We now come to the period when the influence of the Italian manner began to be felt. The change was gradual, more gradual than that from any one of the preceding styles to the next. The actual causes of the change of style in mediæval times have never yet been thoroughly explained. How was it that within ten or fifteen years the forms given to the ornamental parts of buildings should have altered so completely as to constitute a new and distinct style, and that the change should have affected work over the whole country at the same time? Where was the dictator of fashion located? And how came he, in those days of difficult communication, to influence simultaneously districts so far apart as Yorkshire and Devonshire, Norfolk and Cheshire? Whatever he was—guild or fraternity or society of free-masons—and wherever he existed, his ways were less sudden in the sixteenth century than they were in the thirteenth, for when the foreign forms had found a lodgment in England they were by no means universally adopted, and the old traditional methods of work were retained side by side with the new for thirty or forty years.

The Italianising of English Work

was a slow process. It began in Henry VII.'s tomb, at the instigation of the king, his son, and it was more or less in Court circles that the new mode was practised. One or two houses of the nobility built between the years 1520 and 1530, such as Layer Marney, in Essex, and Sutton Place, in Surrey, were strongly touched with the new influence. But even here the ancient ideas lingered, and Gothic work is to be found side by side with a rendering, more or less faithful, of Italian detail. Sutton Place is a case in point, where the main lines are still Gothic, while the applied ornament is of the Italian type.

At the Vyne, in Hampshire, the paneling which covers the walls has curious new touches about it, and a Gothic-headed doorway is surmounted by a panel of thoroughly Italian feeling.

The same infusion of foreign ideas is to be found in much, though not all, of the work of the first half of the sixteenth century. At Deene Park, in Northamptonshire, for instance, it is visible only in the scrollwork attached to the coat-of-arms of Henry VII. At Clifton Maybank, in Dorset, the beautiful front had much of the new detail, while the bulk of the work was largely English. So fine a piece of work was this front that it was removed and re-erected at Montacute, and the remnant of the house at Clifton has but little of the new fashion about it. It is impossible to look at this house without noticing the bay window high up in the gable—a somewhat unusual position, but one which was copied at Montacute, and this feature serves to remind us what an important part the bay window played in the design of Elizabethan houses.

The Influence on the Masons.

The worthy masons of England were much exercised by the new fashion. Brought up in Gothic traditions, they found themselves compelled to adopt a style of ornament quite strange to them, and of which they did not grasp the underlying principles. Some of them were clever, some were merely honest plodders, and the result of their endeavours sometimes arouses admiration, sometimes amusement, sometimes pity, and sometimes, in unsympathetic breasts, contempt not wholly free from rage. At Dingley, in Northamptonshire, is one of the most curious examples of the good Englishman striving with these puzzling foreign fashions. His arches are

pointed, but they spring from Classic columns, his gables assume strange outlines, and his Classic mouldings are diversified with curious Gothic beads introduced in a manner which would have shocked Palladio.

The Gradual Decrease of Defensive Features.

But we must return from this digression on style to the consideration of the growth of our manor-houses. By the time at which we have now arrived, halfway through the sixteenth century, the fortification of houses had gone out of fashion; there was no longer need for it. Nevertheless, as it was difficult to get rid of old habits, so it was difficult to dispense with old features and old methods of planning. The courtyard idea lingered on long after the need for such a disposition had ceased. But no doubt the desire survived for keeping control over those who went in and out, and therefore the porter's lodge was still retained; and this was flanked in some cases by towers which preserved the appearance of those which in former days defended the gateway of a mediæval castle, although they no longer fulfilled the same functions. But, as time went on, so the defensive precautions grew less, and houses were made more and more cheerful. Windows were made larger, and placed without hesitation on outside walls. Prospect was taken into account, although it did not yet determine the whole position and arrangement of the house: the garden was cared for and laid out with an eye to display; and the whole place was arranged with a view to a quiet peaceful country existence. The development of this side of life may be well traced in such a house as Canons Ashby, in Northamptonshire.

Richness Everywhere.

The prevailing idea of the well-to-do squire was, like Dogberry, to have everything handsome about him. The body of the house was spacious, and in obedience to the custom, now well established, it was usually planned in a symmetrical manner. The walls inside were panelled, the ceilings covered with designs of greater or less intricacy, the chimney-pieces were made large and handsome, the staircases wide and massive. Heraldry was called upon to help in the decoration, and there are very few houses at all well preserved which do not reveal much of their history through the help of this beautiful and fascinating science—or art should it be called?

Detail.

The same general treatment was adopted in all parts of the country, and the result varied according to the nature of the local materials and the skill of the craftsmen employed. In districts such as Lancashire, Yorkshire, and Derbyshire, where the stone is hard, and in Cornwall, where granite was used, the detail is plain. In the Midlands it is often rich and elaborate. The plaster-work is sometimes admirable in design and execution. In remote places it is often puerile. Many of the smaller houses depend for their effect more upon their simple and picturesque outline than upon richness of ornament.

Planning.

Throughout all these years the plan of the house had been of the same type, namely, a large hall as the chief apartment, supplemented by rooms for the family at one end and rooms for the servants at the other. An adaptation of this idea on a small scale may be seen at Cold Ashton, in Gloucestershire, which also retains its forecourt and entrance gateway. The formal arrangement of the approach, even though on a quite small scale, as in this house and at Eyan, in Derbyshire, lends distinction and dignity not to be obtained by a haphazard arrangement.

With the advent of the seventeenth century the Italian influence gained more ground, and began to affect not merely the detail

but the actual disposition of houses; and yet, side by side with this change, there lingered on the methods of fifty years before. At Houghton Conquest, in Bedfordshire, is a house built for the accomplished Countess of Pembroke. This combines mullioned windows with a very pronounced Italian treatment of the loggia: while at Ragdale, in Leicestershire, built by Sir Henry Shirley in 1629-31, is a hall which retains the far simpler treatment reminiscent of Elizabeth's days. In the same county is Stapleford Hall, where at about the same time (1633) William Sherard had rebuilt a wing in which he combined some ancient Gothic niches and statues with the gables and dormers which were characteristic of his own period.

The change towards stricter Italian detail produced many interesting pieces of design, in which it is evident that the mason, although compelled to adopt the prevailing fashion, yet rebelled against giving up his ancient freedom in favour of strict rules, with a result both quaint and interesting. Such is the doorway at Chevey Cant, not far from Bath. The advance of formalism and the change in the disposition of the accommodation of the house may also be seen at Chelvey Court, in Somerset, where there is no longer a central hall but merely an ante-room leading to the living-rooms and the staircase. Here, although the plan has changed from the Elizabethan and Jacobean types, the porch and many of the windows are still of that style.

Formalism

continued to increase as the years went by, especially in the larger houses, but in those of the manor-house type it was restrained chiefly on account of expense, and the simpler forms of the eighteenth-century house are nearly as pleasant to look upon, and harmonize as well with the English landscape, as the mullioned houses of a hundred years earlier. They frequently exhibit a little play of fancy in parts of the design, although in the nature of things the increased deference paid to set rules precluded those unrestricted flights which are so charming a characteristic of earlier and freer days. But if the houses offered less scope for the imagination, the garden gave it a wide range, and we owe to the eighteenth century some of the most charming designs for the surroundings of the house which could be desired. This is not the occasion for pursuing that branch of design at any length, but, broadly speaking, all the most delightful old gardens, with their straight walks, their clipped edges, their statues, lead vases and pleasant summer-houses, were laid out in the early years of the century before last. Not that the seventeenth century neglected this part of the process of making a home—not at all. The Parliamentary surveys of the houses belonging to Charles I. give dry formal descriptions which the imagination can easily expand into the most glowing pictures. Sir William Temple was a great gardener. Numberless examples might be mentioned of splendid lay-outs—Hampton Court, Boughton House, Badminton, Wrest; but these are much vaster in scale than our manor-houses, and many of them have been destroyed. We may fairly say that the high-water mark of beautiful gardening was attained in the first quarter of the eighteenth century.

Such is the account of the old manor-houses of our English counties.

Discussion.

Mr. H. D. Searles-Wood, in proposing a vote of thanks to Mr. Gotch, mentioned the heraldic devices found on old manor-houses, and he expressed regret that there was no handbook which gave them in a succinct form. He thought that such places as Barrington Court should be preserved to the public.

Mr. S. F. Clarkson seconded and Messrs

ONE OF THE NEW GATES FOR BUCKINGHAM PALACE IN THE WORKSHOP OF THE BROMSGROVE GUILD OF APPLIED ARTS AT BROMSGROVE, WORCESTERSHIRE.

John Murray and W. A. Forsyth supported the vote of thanks. Mr. Theo. Moore thought it would be interesting to know whether the planning of the old houses was evolved from small houses upwards or from large houses downwards. He thought in many cases the plan had grown from the nucleus of a hall and kitchen.

Mr. Gotch, in reply, mentioned that Barrington Court was still in the market, but he believed that an effort was being made to raise the necessary money to preserve it to the public. With regard to the development of the manor-houses, he believed they began from a small type and worked upwards. The early houses consisted of a hall with a private room at one end and the servants' quarters at the other. The plan was gradually extended at each end, and so, as time went by, developed into the courtyard plan. He did not think so much attention was paid to appearances, but the old builders built constructionally and, as often happened, this resulted in something beautiful.

BAALBEC.

IN the course of a lecture on Baalbec which he delivered recently before the Bradford Scientific Association Mr. E. Naylor said the city was the site of a very early city, though no scrap of reliable history in regard to it existed prior to the Roman invasion. According, however, to the local tradition, Adam, Abel, Seth, Noah and Shem were all buried within a short distance of Baalbec. Under the Romans the city was known as Heliopolis. The sole attraction of the city to the visitor lay in its possession of the ruins of a marvellous series of temples,

which covered 15 acres of land. These temples were built probably during the first three centuries of the Christian era, and were of enormous size, but with such excellence of proportion that it was only when one began to measure them that the full magnitude was realized. The great feature was the so-called cyclopean masonry of one of the great temples, which included two courses of immense stones. Three of the stones which Mr. Naylor measured were respectively 62ft., 61ft. and 63ft. long, while they were 14ft. wide and 12ft. in height as they lay in the wall. Another temple presented a colonnade of six columns which, with their base and their entablature, were almost exactly the height from the ground to the centre of the clock of the Bradford Town Hall. In another part of the buildings two landings and steps of a staircase were carved through the middle of a solid cube of stone roft, in each of its dimensions. This was placed by the builders, not on the ground level, but at the top of a staircase between 60ft. and 70ft. high. The builders, in fact, seemed to have delighted in making difficulties and overcoming them. The stone had evidently been quarried a mile or so from the spot, and in the quarries there lay one stone evidently intended for the building, though it was not fully separated from the parent rock. This stone was 70ft. long, and varied in width from 14ft. to 70ft.; it was 14ft. in height. Such a stone, if it could be placed on end and hollowed out, would make a cottage of the floor dimensions ordinarily adopted, and seven storeys in height! Into speculations as to the means by which the old builders continued to deal with such enormous masses of stone Mr. Naylor declined to enter.

THE MERITS OF GLAZED WORK.

TERRA-COTTA has not yet reached its highest development. Architects have been deterred from using it by the imperfections of its early manufacture, such as hot hard colours, the irregularity of shape and size resulting from the burning, the opportunity which the surface gave for the accumulation of dirt in smoky town atmospheres, and the chance of its crumbling in atmospheres charged with chemicals, or at seaside towns, unless thoroughly vitrified throughout.

The manufacture of terra-cotta has progressed, and it is now a much more satisfactory material. Various surface textures have been given it in order to overcome the liability to collect dirt, while better manufacture has overcome the crumbling tendency in strong or impure atmospheres; also the manufacture has greatly overcome the warped and twisted surfaces that were formerly obtained. Terra-cotta has many advantages which should have brought it into greater favour, and there is another important recent development that has produced a form which appears to be the most suitable material for the majority of commercial buildings in cities, namely, glazed terra-cotta or faience. The latter word was formerly applied only to the modelled and coloured glazed terra-cotta known as Robbia ware, the most noted examples of which were the works of the Della Robbia family in Italy, world-famous in art history. These, however, were only produced in small pieces, and never on a commercial scale; and it is only within the last few years that we have been able to obtain sufficient quantities to bring faience forward as a building material pure and simple. Now the manufacture is not limited to modelled work but applies to plain or simply moulded blocks in architectural form suitable for encasing steelwork or to be backed by bricks in the same way as stone.

By reason of the improvements in manufacture, blocks of glazed terra-cotta can now be produced in sizes as large as stone, so that the detailing is much the same, and the jointing can be suited to any desired scale.

The advantages of cleanliness which a glazed surface possesses are apparent. The surface must of course be a lasting one and free from serious imperfections, just as with glazed bricks no glaze can be tolerated which

cracks or crazes, because then, even if the frost does not splinter the glaze from the body, moisture will carry dirt into the cracks and under the surface and produce a bad effect.

Glazed terra-cotta is now made in a wide range of colours, perhaps the most serviceable for external purposes being the lighter tints, such as white or cream and light-blue or green, because of their bright and cleanly appearance, but fine polychromatic effects may be obtained by the judicious blending of colours. The softest and most delicate tints can be obtained from the best manufacturers. For interior work in offices the lighter tints are equally valuable, but as there is often sufficient light available from

windows the darker colourings can be used more readily than for exterior purposes and great richness of treatment can be indulged in. The many advantages outweigh the objection which has been raised by some architects to the sheen of the glazed surface.

Faience can be combined with glazed bricks. In fact, where, of necessity, these latter are used in a building, it seems out of place to combine any other material than glazed terra-cotta with them.

One of the most important buildings that has been executed primarily in glazed material is the head office of the Prudential Assurance Company, Ltd., at Holborn Bars, London. The elevations of the newer and larger portion of the building had, of course,

PRINCIPAL STAIRS AT FIRST-FLOOR LANDING, PRUDENTIAL ASSURANCE BUILDING, LONDON: SHOWING BURMANTOFTS FAIENCE; TILES AND GLAZED BRICKWORK.

to conform with the first block erected many years ago, and therefore red terra-cotta and bricks of terra-cotta clay have been employed for the external elevations. In the interior, however, glazed bricks and terra-cotta have been exclusively used for the surfaces, ceilings being in many cases no exception. The late Mr. Alfred Waterhouse, R.A., particularly favoured terra-cotta in his buildings, and in this building of the Prudential Co., with the completion of which his son, Mr. Paul Waterhouse, F.R.I.B.A., had so much to do, the use was extended beyond his early works.

On the preceding page we give an interior view showing the use of glazed terra-cotta with glazed bricks, demonstrating the possibilities in this direction. The fan vaulting to be seen is all of glazed terra-cotta. The many barrel and Gothic rib-vaulted ceilings, it will be understood, require special care and attention in the manufacture, and they show the exactitude possible under modern processes of manufacture.

An interesting pamphlet has just been published by the Leeds Fireclay Co. (whose Burmantofts works carried out the scheme in the Prudential Co.'s offices) containing many illustrations of their work in the building. Of course, the colour schemes cannot be shown in photographs; the colours of some parts are brown, running into light fawns, with delicate tints of ivory and blue, while in others greens merge into green-greys, with either the ground or ornament relieved by a delicate tint of colour.

The Burmantofts works supplied nearly three millions of glazed bricks for this building; in many rooms they form the decoration alone, patterns being made with different coloured bricks.

This branch of the Leeds Fireclay Co. has a great advantage by reason of the fact that it is able to produce all the glazed work for a building of such large size, which enables the whole of an architect's design to be controlled and carried out from one source, so avoiding many mistakes and eyesores which are often so apparent where such work has to be assembled from many sources.

Keystones.

Mr. Herbert Goodman, A.R.I.B.A., has removed to new offices at 53, New Broad Street, London, E.C.

A new Lighthouse has been erected on the extremity of Portland Bill, and will be opened in January. The lantern will be of 255,750 c.p.

Change of Address.—Owing to increase of business the Spottiswoode Advertising Agency, Ltd., have removed to larger and more commodious premises at Oswaldestre House, 34, Norfolk Street, Strand, W.C.

Great Queen Street Chapel has been acquired by the Wesleyan West London Mission. Plans have been prepared for the conversion of the building into a central mission-hall to seat 2,000 persons. The total outlay is estimated at £25,000.

Proposed new Pier at Hull.—The Hull Corporation Markets Committee have approved a scheme for the erection of a new pier, to facilitate the landing of fruit and other goods at all states of the tides of the Humber. The scheme is estimated to cost £215,000.

St. Peter's Church, Dorchester.—The restoration of this church has now been completed. The tower, which contains a peal of eight bells, has been repaired by Messrs. Meyrick & Son, of Glastonbury, under the direction of Mr. Caröe, and the roof of the fabric has been renovated according to the plans of the diocesan architect, Mr. Ponting, of Marlborough. The total cost of the work has been about £1,700.

A new Conservative Club at Brampton, Carlisle, has been built by Mr. J. Heward from designs by Mr. Taylor Scott, architect, of Carlisle, at a cost of £900.

Reconstruction of Buildings in Princes Street, Edinburgh.—Nos. 26 to 30, Princes Street, Edinburgh, are to be reconstructed for Messrs. R. W. Forsyth, Ltd., outfitters, by Mr. J. J. Burnet, A.R.S.A.

Abergwili Palace, the residence of the Bishop of St. David's, has been rebuilt after the fire which occurred there in April, 1903. The work has been carried out at a cost of £13,000 from designs by Mr. W. D. Caröe, the builders being Messrs. A. Turner & Sons, of Cardiff.

New Inland Revenue Offices at Cardiff have just been completed at a cost of £20,000. The architect was Mr. H. N. Hawks, I.S.O., of H.M. Office of Works, the contractor being Mr. James Allen. The work was carried out under the supervision of Mr. Thomas.

Surveyors' Institution.—At last week's opening meeting of the session Mr. Charles Bidwell delivered his presidential address. It was announced that the council's gold medal for the best paper read during the past session had been awarded to Mr. E. Morten, barrister-at-law, for his paper on "Surveyors' Reports and Certificates."

"Office Towers."—The suggestion for the erection of "office towers" which we made in our issue for last week has attracted considerable attention in the daily press, but we notice the idea has been enlarged into meaning "skyscrapers." That, of course, was not the idea set forth in these columns. It is evident, however, that the need for better ventilated and better lighted offices is widely recognized.

Proposed Work on "Architectural Refinements."—The Edinburgh Architectural Association, in conjunction with the Brooklyn (U.S.A.) Museum of Arts and Sciences, in response to a generally expressed desire, propose to publish a permanent record of the architectural refinements exhibition recently held in Edinburgh. The record will be in the form of a volume comprising 250 plates in 10 vols. printed on paper 15 ins. by 11 ins., with notes and descriptions by Professor Goodyear. The book will, if published, be brought out by Mr. B. T. Batsford, the well-known architectural publisher of London. It is considered unlikely that the published price can be less than £5 nett, but the Edinburgh Architectural Association invite such support as will warrant them in putting the preparation of the work in hand, and of giving to the members and friends of the Association some advantage in subscribing for copies at the special reduced price of £4 4s. The issue of the volume might be looked for early next summer. Applications should be made to Mr. Ingleby Wood, hon. exhibition secretary, Edinburgh Architectural Association, 122, George Street, Edinburgh, before December 1st.

The Leeds and Yorkshire Architectural Society held its opening meeting of the session last Thursday, when Mr. G. Betram Bulmer delivered his presidential address. It was usual, he said, to give some account of the important buildings of the year, but he regretted to say that within the city there was little to mention. The completion of many important works last year and the stagnant condition of trade at the present time accounted for this. Turning to the amenities of the city, he urged that some action should be taken against the advertising fiend, who had planted his boards and letters everywhere. This growing nuisance should be controlled, and town and country authorities should have more power to deal with transgressors. Owners of property also could

assist by prohibiting their tenants from defacing buildings with sign-boards and prominent lettering, confining all privileges in this direction within strict limits. Alluding to the desire for the clean and cheerful aspect of streets, Mr. Bulmer instanced the use of cleansable material, such as hard bricks and terra-cotta, of which there were two examples in Leeds that periodically renewed their pristine beauty, and would continue to do so for years to come, by the application of water supplied by a hose-pipe. Unfortunately terra-cotta lent itself so readily to the repetition of ornament that there was danger of making designs too elaborate, and the multiplication of ornamental features made the cleansing process more difficult. Therefore we should aim at plain wall-surfaces, with high-class decoration sparingly used.

Builders' Notes.

Preston Savings Bank.—The constructional steelwork, fireproof floors, wood-block flooring and asphalt flat roofs of this new building, in course of erection from designs by Mr. Thwaites, are being carried out by Messrs. Homan & Rodgers, of 10, Marsden Street, Manchester.

Birmingham Master-Builders' Association.—The annual meeting and the annual dinner of the Birmingham Master-Builders' Association was held last week, Lieut.-Colonel Barnsley presiding. The annual report stated that a deputation from the Association had waited on the Corporation Water Committee to urge the importance of supplying quantities when inviting tenders for work of any magnitude. With regard to the questions of wages and hours of labour, a set of rules had been agreed to by the members of the National Federation and the various societies of operative masons, carpenters and bricklayers for the establishment and government of conciliation boards in the building trades, with a view to obtaining an amicable settlement of disputes without resorting to strikes or lock-outs; and the Association had arranged with the above-mentioned branches of the trade for these rules to apply in Birmingham. Lieut.-Colonel Barnsley, referring to the depression in trade, said that not for at any rate thirty years past had the building trade generally been so depressed, and it had been especially so during the past year. He noticed, however, there were signs of increased activity among manufacturers, though that might not affect them for some little time to come; for it was always a year, and sometimes two years, in the case of a revival of trade before they saw any corresponding activity and revival in the building trade. They had not given any notice to operatives this year for a reduction of wages. They believed their Association did not exist for that purpose. Though the committee felt the condition of trade quite warranted coming to a reduction, yet they were always reluctant to make any suggestion of that kind, and felt at any rate they should see for another year what the outcome of the present rate of wages would be.

OUR PLATES.

THE scheme of colour decoration for the new chancel of Clapham Parish Church, shown in Prof. Beresford Pite's Academy drawings, is not yet carried out, though the structural work was completed about a year ago. The old reredos was refixed, as well as the former choir stalls, pending this complete scheme of decoration. The scheme is very harmonious in colour, soft greens and blues being predominant.

NEW COTTON MILLS.

(By our Manchester Correspondent.)

AFTER a period of deep depression the Lancashire cotton trade is reviving briskly, and new mills are springing up like mushrooms. At the beginning of July forty-eight mills, containing four million spindles, were just opened, in course of erection or projected, all the companies being registered. To build and equip these mills it is estimated that £5,000,000 will be required and that work will be found for 10,000 operatives. Additions to this list are being made almost weekly.

Unfortunately this great movement is not so much direct help to the building trade as the figures appear to suggest, though full of promise for the general trade of the district. The mills, of course, are mere shells, with little internal builders' work. Moreover, the companies are formed upon a joint-stock principle which has little to learn from even Yankee astuteness. In very many cases the various contractors form the major part of the initial concern, and builders, machinists, engineers—even the merchants who supply belting and sundries—are all more or less paid in shares, the working capital being mainly found by the operatives. A significant fact is that in any description of a new mill the architect's name is seldom given. Yet these immense buildings furnish no mean opportunity for the display of really good architecture, and in many cases a simple treatment, with bold outlines and good proportions, has resulted in fine elevations—which are possibly quite lost upon the matter-of-fact shareholders. The one new feature in these mills is an experiment towards electric driving. At Pendlebury a cotton mill containing 80,000 spindles is running, driven entirely by electric motors, the current being taken from a public power station. This is the first cotton mill in the country so driven. In another case—Messrs. Ashworth, Hadwen & Co.'s Droylsden mill—electric transmission is being substituted for shafting, and the generators are to be driven by steam turbines. It is stated that a syndicate formed to erect new mills in Macclesfield and other towns proposes to use gas-producer plants and gas-engines.

All this means a great breaking away from old traditions. Hitherto a cotton mill, with its regular and heavy load—running up to 1,000 or 1,200 horse-power—has been considered a typical steam-engine drive. The new departure will be watched with great interest.

Gas producer Plant for Builders.

The power used by builders, is so small relatively that any comparison with a large mill would be absurd. It may be stated, however, that two firms in this district have found electric driving terribly expensive, though the intermittent running of builders' machinery should suit electric motors perfectly. On the other hand, the gas-producer plant is rapidly winning favour. Indeed, there can be little doubt that for moderate loads—say from 20 to 200 horse-power—this form of energy has an immense future. The two advantages of the plant are the low cost of fuel and the little attention required. It is claimed, that under ordinary working conditions, power may be produced at from $\frac{1}{2}$ d. to $\frac{1}{4}$ d. per brake-horse-power hour, according to the size of the engine, these amounts including maintenance, depreciation and interest. As a case in point, a Manchester contractor is driving a 100-b.h.p. load at a cost of about 25s. per week for fuel. He states that ten minutes at starting and a few minutes at intervals during the day is all the attention required by the plant. "In fact," the foreman said, "we scarcely know that we have an engine running." But with gas-producer plants, as with gas-engines, the true economy is to buy only makes of proved excellence.

Correspondence.

Foreign Fireproof Floors.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—A question of considerable importance to architects is raised by some newspaper correspondence as to the specific materials adopted in the construction of the fireproof floors in buildings on Crown property. It is stated that the fireproof constructional work has been given to a foreign firm and that, considering the number of unemployed at the present time, an injustice has been done to the British working man.

I think that such a charge, which is incorrect, should not in the interests of the architectural profession be allowed to pass unchallenged. I understand the materials used, although imported from Italy, are fixed by trades-union bricklayers and labourers, that the steelwork and concrete is of English manufacture, and that the agents in this country are Englishmen. If an architect, after considering the cost, strength and fire- and sound-resisting qualities of various materials used in the construction of a floor, decides in favour of a material of foreign importation, would he be justified in discarding it solely from the fiscal point of view? Then again, were it found that this material was considerably cheaper than that of English production, would he be studying the interests of his client by favouring home industries?

I think the profession generally will agree it is the duty of an architect to obtain for his client materials in the cheapest market that will best meet all requirements. If the profession is to be dictated to by the British working man, we shall next hear that it is not to specify marble, terrazzo, asphalt or even timber because it is not English and in many cases is executed with foreign labour.

There are two ways of looking at most things, and this seems to be the case with regard to the matter under discussion. I feel sure it will be the opinion of readers that the question of materials specified, whether of English or foreign manufacture, should be left entirely to the discretion of the architect responsible for a building.—Yours truly,
LONDON. A. C. F.

[We publish the above as a matter of interest to architects and builders; but, of course, our correspondent's opinions are not necessarily our own.—Ed. B.J.]

The Reform of Architectural Competitions.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I am glad to see by the recent articles in your journal that you propose to take up the question of competitions with the object of improving the conditions under which they are carried on. I notice that you refer to two causes of complaint—the ignorance or bad faith of promoters, and assessors; but you do not mention the third—the ignorance or bad faith of the competitors themselves. Ought not this to claim your equal attention?

While everyone who has thought much about the matter realizes (or so it seems to me) that the root of the trouble lies far deeper than any question of mere mismanagement, and is to be found rather in the bad and unsystematic education of the architect, with its resultant ignorance of and difference of opinion about the fundamental principles of architecture and the qualities which distinguish a fine design—the righting of which must be a matter of time and slow development—yet surely there are certain reforms in management which might be considered by all to come within the area of practical politics.

To me the most urgent question of practical reform at this present moment is the need of a jury in the place of a single assessor—to which I notice you refer—and I believe that

in saying this I am only giving expression to general opinion.

It is impossible to point out in a short letter all the arguments in favour of this reform, and all the other improvements which I feel sure would incidentally grow out of it. I can only commend it to you as a matter of the first importance, calling for immediate attention, and as a reform which I am convinced will have a far-reaching influence for good.—Yours truly,

WESTMINSTER.

A. R. JEMMETT.

NOTES ON COMPETITIONS.

An Elgin Competition.

REGARDING our references to the Elgin Cemetery Extensions Competition, we have received the following letters:—

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Your issue of November 8th and the article therein, "Two more Unsatisfactory Competitions," has been brought under our notice. With regard to your remarks on the competitive plans for the extension of the Elgin Cemetery, we have to state that the competitive plans were submitted to a professional assessor and reported on, and the design was selected before the envelopes containing the names of the competitors were opened; further, the design was selected without any knowledge on the part of the committee of who the author was. The plan selected was afterwards considered by the committee and their own architect, and certain alterations made thereon, but these alterations were irrespective altogether of any ideas contained in the other plans. We are not aware that it is necessary to submit such plans for the ultimate decision or criticism of "The Builder" or any other newspaper, and it is, we consider, unnecessary and very inconvenient to do so. We will expect this letter to appear in your paper as an answer to your article.—Yours truly,

ELGIN.

STEWART & McISAAC.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—As a reader of your paper for many years I regret to find that you have been so misled about the competitive plans for the above. In justice to the committee I beg to give you the following information:—(1) When the plans for the new extension were under consideration the committee wished to give local men, as ratepayers, an opportunity of competing, and accordingly, after preparing a memorandum of conditions, advertised the competition in the local papers. (2) The memorandum of conditions contained the following clause: "The Cemetery Committee will adjudicate upon and select the best plan for their purpose, and will take the advice and assistance of a qualified assessor in doing so" . . . "The works are to be carried out by the committee under their own architect, and the committee reserve right to make such alterations on the plans selected as to them may appear necessary" (3) On the designs being submitted, I was asked by the committee, as their own architect, to go over the three most likely ones, independently, preparing a report on the relative cost of each on a common basis, and a few notes on their suitability for the purpose. (4) This report was laid before the committee together with the designs, and after careful consideration the design marked "Moray" was unanimously selected, the author's name being only ascertained after the envelope containing his card had been opened. (5) Immediately the selected design had been fixed upon, the secretaries were instructed to pay the premium, and, after ascertaining the authors' names and addresses, to return the whole of the others.

Personally I am pleased to assure you that no unfair advantage was taken of the designs

submitted by any other than the successful competitor. I hope these explanations will modify the views expressed in your leader, although doubtless it may never come under the notice of any of the parties interested.—I am, yours truly,

JOHN WITTET,
Elgin. Architect and Surveyor.

[The information which we published was furnished by Messrs. Stewart & McIsaac, solicitors, secretaries to the committee, in reply to a letter from us asking (1) for the names of the architects placed first, second and third; (2) whether the designs were to be on exhibition, and if so the date of this exhibition, so that our representative might have an opportunity of seeing the designs with the object of criticizing them; and (3) for a copy of the conditions for use in connection therewith. The reply from Messrs. Stewart & McIsaac stated: "The prize for the competition was awarded to William C. Reid, architect, Elgin. The design is under consideration with a view to alterations on it, and we do not think that the committee will care to have it criticized." Nothing is said as to any other architect being employed or as to any exhibition of designs having been held, and no copy of the conditions was sent; nor were we furnished with any information which would have allayed suspicions likely to be aroused by such a letter. Even now the firm of solicitors does not furnish the name of the professional assessor; though the knowledge that he was the committee's architect is afforded by our other correspondent. As regards the other remarks contained in the firm's letter, when a public appeal is made through the newspapers it is generally reckoned that the press and public have a right morally, if not legally, to an opportunity of obtaining a knowledge of the facts. Whether the competitors were able to see the designs submitted we do not know. Mr. Wittet provides more information. Apparently from his statement the committee did not desire to obtain ideas, but just to give local men as ratepayers the opportunity of joining in a competition. They had their own preconceived ideas, we learn, by which they modified the accepted design, and it seems to us illogical for them not to have gone further and appointed the successful ratepayer to carry out the work. Whereas the committee's solicitors state that an assessor was employed, the committee's architect says that he only reported on the designs and that the committee, after careful consideration, unanimously selected a design. Our readers can draw their own conclusions from the facts above stated.—Ed. B.J.]

Preston Schools Competition.

[1st (£50), Woolfall & Eccles, Liverpool; 2nd (£30), Alfred E. Corbett, Manchester; 3rd (£20), Charles B. Pearson, Lancaster.]

In reference to this competition we have received the following letter from a well-known Manchester architect:—

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Believing you are taking more than ordinary interest in the evils of many public competitions, I take the liberty of bringing before your notice the decision in the competition for a secondary school at Preston limited to architects of Lancashire. The evil to me is that the assessor has failed considerably in his judgment, and although there are several very good plans he has chosen the first three from what I should consider very inferior results. Several competitors, together with myself, are thinking of protesting in some combined form, as we strongly feel this wrong decision. The plans are open to the public until the end of this month, and the names of the competitors

are affixed to the drawings. The assessor I understand is local.—Yours truly, X.

Having regard to the eminent source of the information received, it seems that this is still another instance where the judgment of the assessor has been at fault.

It is to be hoped the protest of competing architects referred to by our correspondent will not be in vain. We shall be pleased to put any competitors into communication with our correspondent. Cases of this nature are occurring with such frequency that it is time the whole system governing the conduct of competitions was looked into very thoroughly with the object of devising some method whereby the regrettable results to which attention has lately been directed in these columns may be prevented. In all fairness, it must be conceded that promoters are not always to blame. In fact, they are often in as unenviable a position as the competitors themselves. Could they not in many instances retaliate upon objecting competitors as follows: "We have based our conditions upon recognized standards, we have obtained the services of a professional assessor, we have agreed to abide by that assessor's award, you have taken no exception to his appointment but have sent in your designs, whereby we were confirmed in our opinion that he was a suitable person for the position, and now you are dissatisfied with his award. What are we to do—adjudge the designs ourselves, allow you to do so, or put ourselves to the expense of engaging another assessor?" Competitors themselves are greatly to be blamed; leaving the case of Preston out of the question, they are often only too ready to rush into competitions regardless of the ability of the assessor and the quality of the conditions; they lack *esprit de corps*, as is evidenced by their unwillingness to come forward and protest in a body when flagrant injustice has been done to their own or their fellow-competitors' designs, by the mistrust with which they view the efforts of any society promoted for the purpose of battling with abuses, thereby crippling that society's power for working good, and neglecting their own opportunities for becoming one of a mighty combination which should possess the power over life and death as regards competitions. But for a millennium it seems useless to hope, and other methods must be sought for the mitigation of present evils. The great thing to be realized is this, that no matter how carefully assessors are chosen they may be liable, being but human, to an occasional error of judgment. To provide for such a contingency it ought to be possible to organize a body, preferably in connection with the R.I.B.A., of architects of repute to which an appeal against an assessor's decision could be made by a definite proportion of the competitors, such body to exist for the purpose of dealing with the appeal, considering the designs, making a fresh award, or affirming the assessor's decision. It is hoped to deal at greater length with this suggestion at a later date.

Proposed Extension of Birmingham's Council House.

Let all competing architects who are deploring the present dearth of anything worth "going for" take hope and stifle the sighs which rise at thoughts of the well-fought battles of Hull and Westminster, for there are great doings at Birmingham, where a field of battle is being prepared in the vicinity of Edmund Street, Concreve Street and Margaret Street. Next Tuesday, November 28th, the Council is to meet and consider a report which will be presented by the General Purposes Committee stating the particulars of the accommodation which will be required by the several Corporation departments, upon which matter they have obtained the advice of the Corporation's consulting architects, Messrs. Aston Webb & Ingress Bell.

The scheme provides for the accommodation of the Gas Department with an extension of the Art Gallery upon an upper floor at an estimated cost of £74,000, Tramways Department £15,000, and other departments £48,000, making a total proposed expenditure of £137,000. The consulting architects recommend that preliminary sketch plans be invited, from which not less than six nor more than ten be selected, the authors of such selected designs to submit others in a final competition, for which they should each receive 100 guineas. From the final designs the best will be selected by the consulting architects in consultation with the committee. Suggestions are made as to how the competition should be conducted, and these are all sound. The committee are in favour of the architects' recommendations, and are applying for authority to obtain plans in accordance therewith. It is intended that the sketch designs shall be sent in by March 31st next.

New Premises for the Royal Institute of British Architects.

"We, the undersigned members of the Institute, having learned from the president's address delivered on the 6th instant that the R.I.B.A. is about to erect a new building for its own use, feel that an opportunity of designing this should be open to all its members. In the event of this opportunity being afforded, we suggest that a competition should be held and its conditions based on the 'Regulations for Architectural Competitions,' and that the members should select a jury of three assessors by vote." Such is the wording of a petition which was delivered to the secretary of the Institute on Monday (November 20th) bearing about 150 signatures of members of the R.I.B.A. in London, Liverpool, Birmingham, Manchester, Leeds, Cardiff, Nottingham, Leicester, Plymouth, &c.; a remarkable number of signatures in view of the short time allowed for obtaining them—four days. The R.I.B.A. charter and by-laws require that questions affecting the property of the Institute be subject to a resolution of a general meeting. No doubt a special general meeting will be called in due course. It ought to be productive of some interesting discussion.

Swansea Competition.

We have received the following communication from a correspondent: "For an especial piece of competition cheek I beg to draw your attention to the Swansea Corporation Housing Scheme, 1905. I am unable to send you the particulars, as they only came to me indirectly. These gentlemen require builders (and possibly architects) to submit plans, specifications and tenders for about twenty-eight houses. There are no stipulations as to cost, accommodation, premiums or assessor, and they will not be responsible for any expenses incurred in preparing the scheme, nor will the lowest or any tender necessarily be accepted. A significant clause is that builders will be required to pay the trade-union rate of wages. These gentlemen, who desire to obtain ideas and designs for nothing, are extremely anxious that the workmen should be fairly paid. And why? From humanitarian motives? Not a bit of it. But because the workmen have had the sense to combine and demand fair treatment. How soon will the profession cease to whine and commence to hit?"

New Municipal Buildings, Dartmouth.

For the proposed guildhall, municipal offices and markets at Dartmouth thirty-seven sets of drawings were received by the borough surveyor (Mr. Arthur Smith), and after careful consideration the town council has awarded the premiums as follows:—First (£50), No. 108, Mr. R. Montague Luke, C.E., architect and surveyor, Plymouth; second (£30), No. 11, Mr. Horace T. Bonner, A.R.I.B.A., C.E.,

architect and surveyor, London; third (£20), No. 132, Messrs. Bridgman & Bridgman, F.R.I.B.A., M.S.A., architects and surveyors, Torquay and Paignton. The designs were exhibited in the Market Hall last week. Mr. Luke's elevations are in a somewhat free treatment of the eighteenth-century Renaissance, in Devonshire limestone. The nautical associations of the town are expressed in all the sculptured ornament, and on the façade are bas-reliefs representing admirals who may have been connected with the town's past history, while other sculpture illustrates its naval history. The skyline of the front is broken by a central dome supporting a clock turret. At the sides are two angle turrets. On either side of the dome-lighted entrance hall are the municipal offices, and above these the council-chamber, mayor's parlour and guildhall, whilst the main staircase leads directly through a crush hall to the town hall. From either side street are entrances to the meat and general produce market and the butter and poultry market, each covered with glass roofs and connected by a covered way. Entered from the Market Square and entirely separate are the fish markets, office and weigh-house, also the fire-engine department, over which are the dressing-rooms to the stage of the hall. Provision is made for cold storage underneath the hall.

R.I.B.A.

Mr. Denell on American Methods of Erecting Buildings.

A MEETING of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the president (Mr. John Belcher, A.R.A.) occupying the chair.

Mr. R. A. Denell, managing director of the Waring White Building Co., Ltd., read a paper on "American Methods of Erecting Buildings." In his opening remarks the author referred to the increase of rapidity of construction and economy as being the dominant factors in the consideration of the subject. American contractors are generally good business men, and apply business principles to their affairs. They try to make every man in their employ responsible in his own position or sphere, advancing him when he shows capabilities to trust his own judgment and to go ahead alone successfully. The best builders in America, as a general rule, have served a large portion of their apprenticeship in architects' offices, and this has resulted in a better understanding of the architects' ideals and demands.

Careless of Labour.

We get careless of our labour here because of its cheapness; were it more expensive we should watch over it more and give it better supervision. The best American contractors never allow more than twenty-five men to work without a foreman, the result being that he sees that they work and, what is more important, that the work is planned out for them in advance, and that their materials will be ready as wanted. One of the chief reasons for the rapidity of construction in large buildings in America is the way in which materials are dealt with. Time being an essential factor, it would be impossible for a contractor there to execute joinery, stonework, marble work and ornamental plastering so efficiently or so well with his own plant and in his own shops as each man in his own particular trade who has made it a speciality and has had lifelong experience in it. Such work as steel, terra-cotta, partitions and mechanical plant is manufactured by much larger firms than here, and can therefore be supplied much more quickly. The builder stands, however, between the architect and the specialists,

seeing that the material is correct in quality and workmanship, and is being worked carefully to details, and also that it is being advanced so as to be ready at the proper time to fit in with the other work.

Remuneration of Architects.

Coming to the larger aspect of the subject, the author observed that the difference in the methods of construction in American practice is the result of evolution in response to certain conditions, climatic and economic, and public demand. The predominating client being practical and commercial, his demands are those that result in the greatest financial benefit to himself, such as speed, economy in construction, greatest available space to let, &c. The remuneration of American architects is the same as here; but for this much more work is required, more detail drawings having to be furnished, and no assistance from clerks of works or quantity surveyors being afforded. In America the quantity surveyor is unknown. The time given to builders in which to estimate is rarely over a fortnight, and each builder keeps his own staff of estimators. If consulting mechanical, sanitary and structural steel engineers are required, they are generally employed by the architect; and to avoid the expense of this many architects have these engineers on their office staff. This would only be remunerative when a large amount of work was done annually—in the case, for instance, of men who deal with the largest work, amounting to from one to four millions sterling per annum. In some cases an architect's establishment costs would be about £50,000 a year.

Authorities in the States.

In America each city has its own building department, which is the only authority to be consulted. Before starting work plans must be filed and approved, after which, except for variations, &c., one can proceed without further interference if following plans which have been filed. The larger cities have a competent staff to deal with building works; and also an engineering staff to calculate the strength of the various parts from the drawings, so as to see that they conform to the by-laws and are structurally safe, and thus prevent "jerry" building, &c. Again, each city has its land surveyors, who at once, upon notification, fix according to law, and to deed and title, the exact boundaries of your client's property. Thus the architect, immediately upon starting his work, obtains exact dimensions for his plans, so that the builder has these fixed dimensions to work to and from which to order materials in advance.

Materials.

With regard to materials, a small brick is used, measuring on the average about 8½ ins. by 4½ ins. by 2½ ins., except glazed bricks, for which the English size is generally used. The bricks are laid in all manner of bonds, such as English, Flemish, no-bond, &c. For this last reason English brickwork is superior structurally to American. Timber is much more extensively used, and is much cheaper than here. This is the reason of so many wooden houses being erected, and also so much "mill construction," or what is called "slow-burning construction." Terra-cotta, the author considered, has reached a higher usefulness in America than here, the reasons being, first, the greater variety of clays, which gives the opportunity of furnishing almost any colour or shade; and, secondly, it is particularly fitted for an external covering to a steel skeleton frame. America is also in advance in its manufacture, the terra-cotta being straighter, truer, and produced in much larger blocks than here, thus more nearly approaching stone in design.

There is very little concrete stair work in the States, cast-iron being used in fire-resisting buildings on account of the lightness of

construction. In the author's opinion it would be better for American practice, especially as regards fire-resistance, to follow the English by using concrete staircases in all fire-resisting buildings, and also as regards the system of concrete lintels in use here but not in America.

For buildings over eight storeys in height the prevailing system of floor construction is either hollow terra-cotta blocks built in arch form, with either flat or segmental soffits or some form of reinforced concrete. Partitions in these buildings are of hollow terra-cotta blocks, expanded metal or "Mack." Breeze building blocks are not yet used. In New York all buildings over twelve storeys in height must not only have the floors and partitions of fire-resisting material, but if woodwork be used it must be treated, whatever its kind, by a fire-resisting process. All exterior window frames and sashes must be of metal with fire-resisting glazing.

Party-walls are not customary in the larger buildings, and the cantilever foundation has been devised to meet the need of supporting adjoining walls on their respective curtilages without the expense of underpinning and guarding against disturbance that comes from using spreading foundations which enter upon neighbouring land.

The author called particular attention to the large amount of cast-iron work used in the States in the framework of buildings up to twelve storeys in height. Cast-iron, he believed, could be used to great advantage here for stanchions.

The Skyscraper.

Passing on to consider the "skyscraper," a type of building that has more or less revolutionized building practice, the author referred to the tales occasionally heard of forty-storey buildings. Such, he believed, could be safely built; but he thought that the practical commercial building would not be higher than twenty storeys, and that would soon be the limit. When built on proper lines the life of these steel-frame buildings is as long as that of other buildings. The steel is entirely buried in concrete, all exterior stanchions being enclosed in brickwork, and the interstices grouted full of cement-mortar. The interior stanchions are similarly covered by bricks or fireclay. As to a comparison in cost between buildings supported on steel stanchions and by ordinary brick walls or piers, the cost of carrying a load on a steel stanchion is about one-third that for carrying the same load on a brick pier, provided the load is about 60 tons. There is also a saving of floor space by steel construction. The advantages too in the way of planning are great, for walls can be taken out and large areas gained wherever desired. Again, the building's advancement does not entirely depend upon weather or even daylight, as work can be carried forward in the various shops and well in advance. Not only that, but the steel frame can be pushed ahead and the enclosing shell can follow at any floor.

In conclusion the author said that architect and builder should work together. The builder must have plans, details and instructions complete and definite at the earliest moment in order to accomplish the desired results. Give him full control and make him alone responsible. If the architect deals with one person for a portion of the work and another for something else, he not only relieves the builder of a portion of that responsibility, but he actually hampers the builder's progress, for then the other person looks to the architect and not to the builder.

Mr. Benjamin I. Greenwood (president of the Institute of Builders) proposed and Mr. John Slater seconded the vote of thanks. Messrs. Howard Colls, William Woodward, E. W. Hudson and A. T. Taylor (Canada) also took part in the discussion.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Moment of Inertia.

BRADFORD.—F. writes: "Please explain how to use the least moment of inertia (1) for a 12in. by 6in. by 54 lbs. r.s. joist over a span of 12ft. with a load of 4 tons 3ft. from one end, and (2) for a similar beam used as a stanchion, height 16ft., ends fixed."

A rolled joist may have the moment of inertia taken in two directions. When it is resting on one flange, as in its ordinary position as a girder, the greatest moment of inertia comes into play, that is, the tendency to bend takes place in the direction of the greatest resistance, which is the depth. When the rolled joist is used as a stanchion the least moment of inertia comes into use, as the tendency to bend will be in the direction of the least width. For example a 12in. by 6in. by 54 lbs. rolled steel joist on a span of 12ft., with a load of 4 tons concentrated at 3ft. from one edge of the span will have a maximum bending moment $M = \frac{Wxy}{L} = \frac{4 \times 3 \times 9}{12}$

$= 9$ ton-feet or 108 ton inches. The moment of resistance $R = \frac{I}{c}$, $I =$ greatest moment of inertia $= 369.91$, $y =$ distance from neutral axis to furthest edge of section $= \frac{1}{2}$ depth, $= 6$ ins., $c =$ strength modulus, say 8 tons per sq. in. Then $R = \frac{369.91}{6} \times 8 = 493.21$ ton-inches, which the joist is capable of standing, while the actual bending moment put upon it is only 108 ton-inches. The same joist used as a stanchion 16ft. high would carry a safe load of about 60 tons, worked as follows: By Rankine's modification of Gordon's formula

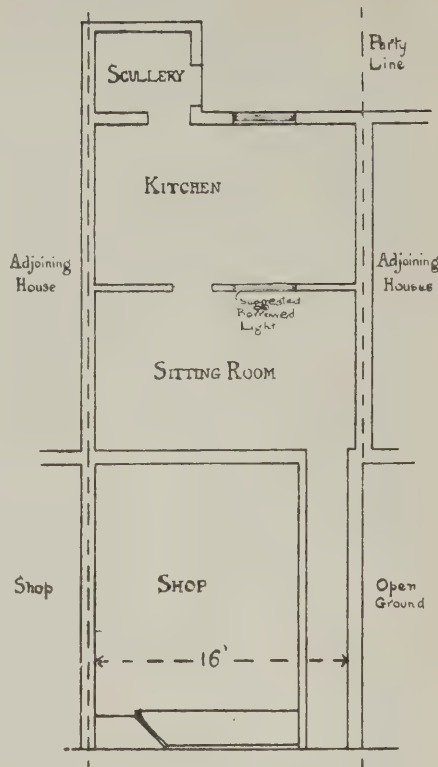

$p = \frac{f}{1 + \frac{f^2}{c^2}}$, where $p =$ safe load in tons per sq. in., $f =$ maximum working stress in tons per sq. in. on a short specimen (say 6 for mild steel), $l =$ length of stanchion in inches, $c =$ constant $= 36,000$ for flat ends, $r^2 =$ radius of gyration in inches squared $=$ moment of inertia. The area of section being 15.9 sq. ins. and the least moment of inertia 31.43, the radius of gyration squared $= \frac{I}{A} = \frac{31.43}{15.9} = 1.976$. Then $p = \frac{6}{1 + \frac{(6 \times 12)^2}{36000 \times 1.976}} = \frac{6}{1 + .518} =$ say 4 tons per sq. in. The sectional area being 15.9 sq. ins., the safe load will be $15.9 \times 4 = 63.6$ tons.

HENRY ADAMS.

Paving Apportionments.

WIGAN.—PAVEMENT writes: "An estate, A, at the corner of a street and a highway, faces another estate, B, on the opposite side of the street. Can the owner of estate A be compelled to pay the cost of paving apportionment of street laid down by estate B? The street was laid out by B. for his own convenience and benefit up to and adjoining A, but is not used by A."

We should say not; but can find no record of any legal decision on this point. Certainly the owner of estate B cannot make the owner of estate A pay anything. It is only the properly constituted local authority who can compel payment for making up a road.

Books on Architectural Design and Construction.

(1) CHATHAM.—NAVAL writes: "Please recommend one or two books on the principles of architectural design, giving prices."

(2) X. Y. Z. writes: "Do you know of any books that deal solely with ancient Roman construction and architecture; also a good work on Etruscan architecture, giving plenty of detail. I should be glad if you would give an illustration showing the method of roofing the ephebeum or large hall in the ancient baths (I presume that the brick vaulting was not exposed externally); also the method of lighting. I am aware that M. Choisy has written the most extensive work on Roman construction, but do not know where his works may be seen in England nor what is the price of them, and being but an indifferent French scholar would much prefer a book written in English."

(1) There is no one book that deals thoroughly with the subject of architectural design. In fact, the subject embraces the whole of building construction, art history and social and intellectual life. We can only recommend you to read Ruskin's "Seven Lamps of Architecture" and the chapter on "The Nature of Gothic" in "The Stones of Venice"; Viollet-le-Duc's "Rational Building"; Eidlitz's "Nature and Function of Art, more especially of Architecture"; Fletcher's "History of Architecture"; Prior's "History of Gothic Art in England"; Blomfield's "Renaissance Architecture in England"; and H. H. Statham's "Architecture for General Readers" and "Modern Architecture," taking them in the order stated.

(2) Early Roman architecture has been very inadequately treated by English writers. We only know of Choisy's work as at all a proper treatment. You can probably obtain a copy from Mr. B. T. Batsford, of 94, High Holborn, W.C. The Roman method of roofing by concrete domes in the Roman baths is explained by Choisy, with fine plates of suggested restorations. Copies can be seen in the library of the Royal Institute of British Architects, 9, Conduit Street, W., and at the British Museum. Some of Choisy's conclusions are summarized by Viollet-le-Duc in his "Rational Building," of which there is an English translation (post free 12s. 6d. from our offices).

A SHOP ALTERATION.

A Shop Alteration.

BARROW-IN-FURNESS.—H. J. A. writes: "The accompanying plan shows a proposed shop addition to some houses. Which is the best way to light the sitting-room? You will notice that this room is practically in darkness except for the borrowed light, which could be put in the wall dividing it from the kitchen. The positions of the two rooms may be altered in any way, but the property adjoining must not be touched."

Your proposal to gain light to the sitting-room with a borrowed light would, in our opinion, be most objectionable, and the ventilation would become difficult. We suggest two methods of improving the lighting of the sitting-room. In the first place, we suppose the shop will be a single-floor one, and therefore it would be possible to obtain a top light in the sitting-room in a similar way to that usually adopted with basements, as shown in the section above. A portion of the shop could be cut back so as to give a greater amount of window surface. If the window extended across the whole width of the sitting-room a good light should thus be possible, for the maximum light is obtained within the angle of 45 degs. to which the floor and the ceiling are raked back; but if the window cannot be made of good length, by the use of prismatic glass the lighting could no doubt be rendered fairly good. By use of a wood-block floor in the shop greater height could be gained. We assume the floor of the sitting-room to be of the ordinary kind—boards and joists with concrete under. You do not show the position of the staircase on the plan. If the shop is to be built over, then we suggest the second method, namely, to relegate the kitchen to a back addition with the scullery. The extra cost of this would not be very great; and although it might be thought that the sitting-room would thus be enlarged beyond what was necessary, the extra space would no doubt be much appreciated, while the lighting could by such means be adequate.

Architects and their Assistants.

KEIGHLEY.—X. writes: "Last July I was suffering from a nervous breakdown, partially caused by overstrain of the eyes, and left the office where I was employed without first consulting either of the principals. I

wrote explaining the cause of my absence, and enclosed a doctor's certificate. In reply I received a curt letter saying my services were no longer required. I again wrote on July 17th and September 27th, but the letters have not been acknowledged. Please advise me what to do in the circumstances. Would it be advisable to bring an action against the firm (1) to obtain a testimonial, (2) for breach of agreement in not giving me a month's notice? If so, could you give me some idea of the expense? In previous cases of illness I have always received the most considerate treatment, but this last appointment was with a firm who regarded architecture simply as a business for making money. Both partners in the firm are Fellows of the Institute, and the senior partner is, I believe, a J.P. I send copies of correspondence and agreement."

After carefully reading your agreement and correspondence, I am of opinion that you have absolutely no case against your late employers for not giving you a testimonial or reference. No employer is required to give one unless he has agreed to do so, which is almost an unheard-of agreement. But in regard to the month's notice you have something of a case, though a very doubtful one. Speaking generally, an employer (in such a case as this, and in the absence of agreement or custom to the contrary) is liable to pay the wages of his employee while the latter is ill. It was decided in the case of *Cuckson v. Stones* that the "incapacity of the servant from sickness is not a determination of the contract, nor will it justify dismissal without regular notice." At the same time, it might be successfully argued for the employers (I do not know all the facts) that the plaintiff had waived any claim he had by his subsequent conduct and correspondence, or by his method of leaving them. He would claim damages equal to a month's wages, namely, £11. The cost of a county-court action of this kind would vary from £2 to £10 or more, according to whether the plaintiff conducted the case personally or employed a solicitor and counsel. S. P. J. M.

Old Chelsea Church and Greenwich Hospital.

LAVENDER HILL.—AKANTHOS writes: "Would complete measured drawings of Chelsea Old Parish Church form, in every way, a suitable testimony for the R.I.B.A. final; or would a portion of Greenwich Hospital be better? If the latter, would the façade only be required, or would the rooms, &c., have to be shown completely, and which portion would you recommend? Is not some of it Inigo Jones's design?"

The following opinion of the Old Church, Chelsea, expressed by Walford in his "Old and New London," is that shared by all who feel themselves in a position to criticize architecture: "The old parish church of Chelsea, dedicated to St. Luke, stands parallel with the river. It is constructed chiefly of brick, and is by no means conspicuous for beauty. It appears to have been erected piecemeal at different periods, and the builders do not seem to have aimed at the slightest degree of architectural arrangement; nevertheless, though the building is sadly incongruous and much barbarized, its interior is still picturesque." If, therefore, you wish to choose between Old Chelsea Church and part of Greenwich Hospital, the latter place is superior in every respect. The R.I.B.A. examiners would probably accept a good drawing of the façade, but a plan, section and elevations are usually sent in for the measured drawing testimony of study. If you propose to draw a plan as well as an elevation, any one or part of one of the five blocks would be satisfactory for the purpose. One side of a courtyard of any of the four main blocks could probably be measured

and drawn within a reasonable time, but your best plan would be to go to Greenwich and select the whole or part of one of the blocks according to the time at your disposal. The block known as the Queen's House, which was built in 1615-32 for Henrietta Maria, was from Inigo Jones's design, as also was the right-hand block looking from the river on to the river-front. This latter block was built as a palace for Charles I., and is usually known as the King's House. The greater part of Greenwich Hospital is by Sir Christopher Wren, but parts also are by Ripley, Hawksmoor and Vanbrugh.

H. Y. M.

Shrinkage of Measuring Tape.

WORCESTER.—VERGE writes: "Is it a fact that an ordinary metallic wire-woven measuring tape (66ft. roller) sensibly expands and contracts under different temperatures? A friend of mine asserts that his tape is 3ins. shorter in winter than in summer (in the 66ft. length), and I question his statement."

The wire-woven tapes are only useful for approximate measurements; for accurate work a steel ribbon tape must be used. A 66ft. Chesterman's wired tape was used by the writer on wet grass and wound up again. Two days after it was tested at the Guildhall, London, and found to measure 65ft. 4ins.; three weeks later it was again tested and found to be 65ft. 9ins. The normal length when dry was 66ft. HENRY ADAMS.

Stables and Coach-houses.

PLYMOUTH.—REGULAR READER writes: "(1) In designing a stable for three horses will the loose-box serve regularly for a stall, or should a stall be provided for each horse, and the loose-box in addition? (2) What is meant by 'guard stones,' 'wheel lines' and 'stop stones' to a coach-house?"

In reply to the foregoing Mr. Percival Chubb, secretary of the St. Pancras Iron Work Co., Ltd., has been kind enough to send the following: "(1) In designing a stable for three horses we should recommend, say, two stalls and one loose-box, and if possible one box with no communication with the rest of the stable, for sick horses. (2) Guard or other spur stones are made to protect the entrance wall or sides from damage by carriage or cart wheels. With regard to wheel lines and stop stones, these may refer to wheel tracks laid in the paving for the carriage wheels, and projecting stones to prevent the carriage being run back in such a manner as to damage the panels against the back wall of the coach-house; or they may refer to the lines on which the coach-house door runs when opening, in which case the stop stones would mean the iron sockets."

Hospital Design.

X. Y. Z. writes: "What is the most modern system of flooring for the wards and corridors and the lavatories and conveniences of a cottage hospital? We presume tiling and mosaics are much too cold. Would a treatment of tile-work and adamant be a suitable finish to the walls, &c.? What system is the best to adopt to ensure perfect ventilation? If central fires were adopted, which would be the best make and system? We presume it would not be wise to have descending flues where there were both first- and second-floor levels. Is it possible for a central shaft or chimney to be carried through the ridge?"

For the wards teak is often used, but "Eubœolith" is also much favoured. The latter is very suitable for lavatories and conveniences. Tiling and mosaic are too cold for the wards, but are often used for the lavatories. The finish for the walls which you suggest is very suitable; the plaster is often varnished or enamel painted. No doubt the most perfect system of ventilation for a hospital is the plenum system, but the

expense does not always permit its use, and recourse is had to radiators under the windows and extract flues in the walls. Shorland's central stoves are very good ones. Descending flues are often adopted for floors above the ground, and we see no objection to this. A central shaft could be used for carrying off the smoke and products of combustion, as well as the foul air, but the additional expense usually prevents such a proceeding.

A Fire-resisting Strong-room.

LEAMINGTON SPA.—FIREPROOF writes: "I have to fit up a strong-room with shelves and pigeon-holes for a firm of solicitors. The fittings must of course be fire-resisting, and must be free from anything likely to injure parchment deeds or destroy the ink. Would pine rendered fireproof be suitable, or can you recommend anything better?"

It is apparent that if the interior of a strong-room became hot enough to scorch the wood of the shelves the papers would be burnt, and therefore there is no necessity to use a fire-resistant wood. There is an especial objection to using wood which has been processed because the chemicals are hygroscopic and continually keep the wood damp, which would be most deleterious to parchment, paper and ink. You can use ordinary wood for the shelves or adopt tinned sheet-iron or wire-work shelves similar to those in libraries, which are often preferred.

Attendance Item in Quantities.

SUBSCRIBER writes: "In bills of quantities I have often noticed an item similar to the following:—

Item 1.—Heating and Ventilation.

Allow for attending upon, cutting away for, and making good after hot-water engineer in all trades. £ s. d.

When the work has to be done trouble always arises, as the builder happens either by chance to have left out the item, or has merely allowed, say, £10, which he may consider as a mere 'sporting item' providing for unforeseen circumstances. I am at present connected with a firm who have ignored the item altogether, as the items following were based on what the quantity surveyor could foresee, these being priced. Now the engineers ask for pipe clips to be built in the wall to carry the pipe. The contractors, however, contend that they need only fix the pipe. Of course, if the contractors had allowed for the pipe clips in their estimating no question would have been raised. I should like to have your opinion on the matter."

The item to which you refer covers fixing the pipe clips and also cutting holes in walls, floors, &c., and all making good. It is certainly of a "sporting" nature, although a very fair idea of the work involved can be obtained by an examination of the drawings especially if the contractor has an opportunity of seeing the engineer's plans. A fairer method (although the contractor generally has no control in the preparation of the quantities) is to get from the heating engineer the number of holes he requires and any other particulars of the necessary work outside his own contract. Another method sometimes followed is to put in a provisional sum for attendance, leaving the matter to be adjusted at the settlement of accounts, but as this usually involves daywork it is again unsatisfactory owing to the difficulty of separating this from the items chargeable at contract rates. W. E. D.

Belfast's new Technical Institute is making good progress, and is expected to be finished by June next. The institute faces College Square East and measures 240ft. by 204ft., with an area of 100,000 sq. ft. for classrooms. Mr. Samuel Stevenson is the architect and Messrs. W. J. Campbell & Sons are the builders.

Tenders.

Anerley.—For the erection of a bakery and tailor's shop at the Anerley Residential Home for elder deaf boys, and the provision of the necessary trade fittings in connection therewith, for the London County Council:—

F. & H. F. Higgs, Hinton Road, Herne Hill	£1,863	0	0

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending November 17th twenty-four failures in the building and timber trades in England and Wales were gazetted.

W. B. Ashby, builder, Derby.	Deficiency £1,688.
H. T. Cook, builder, Southend-on-Sea.	Adj. Nov. 7th.
J. SUGDEN, plumber, Liverpool.	Adj. Nov. 10th.

H. W. TARRANT, builder, Frimley. Adj. Nov. 11th.
W. ELLIS, junr., surveyor, Clapham Junction. P.E., Wandsworth C.C., Nov. 30th, at 12.
H. BAILEY, builder and contractor, Hull. R.O. Nov. 11th.

E. CORNER, builder and contractor, Bridlington. P.E., Scarborough C.C., Dec. 12th, at 12.
JOHNSON & ROBINSON, builders and contractors, Hull. R.O. Nov. 5th.

G. NETTLETON, joiner, Leeds. P.E., Leeds C.C., Nov. 28th, at 11.

H. WOOLF, builder and contractor, London, E. Adj. Nov. 7th.

W. SAMPSON, builder, Watford. P.E., St. Albans C.C., Nov. 28th, at 10.30.

F. T. PENNY, builder, Northfield. Liabilities £991; assets £160.

A. E. M. SMITH, builder, London, E.C. Liabilities £450; assets £20.

T. NIXON, builder, London, N. Liabilities £3,845; estimated surplus £471.

J. N. DAWSON, builder, Yarmouth. Liabilities £305; deficiency £283.

C. FIELDING, builder and contractor, Glossop. P.E., Ashton-under-Lyne, Town Hall, Dec. 14th, at 12.

J. BATES, builder, Hedge End. First meeting, O.R.'s, Southampton, Nov. 22nd, at 2.30. P.E., Southampton C.C., Nov. 29th, at 12.

J. ORMROD, builder, Great Lever, late Bolton. First meeting, 19, Exchange Street, Bolton, Nov. 22nd, at 3. P.E., Bolton C.C., Dec. 13th, at 3.

G. S. LIST, builder, London, S.W. First meeting, Bankruptcy Court, Nov. 22nd, at 12. P.E., same, Dec. 15th, at 12.

DYER & ARTHUR, plumbers, Newport. First meeting, O.R.'s, Newport, Nov. 22nd, at 11. P.E., Newport Town Hall, Dec. 7th, at 11.

R. F. LAWRENCE, architect and surveyor, Newport. First meeting, O.R.'s, Newport, Nov. 22nd, at 12. P.E., Newport Town Hall, Dec. 7th, at 11.

A. J. RUTSON, builder and contractor, Brighton. First meeting, O.R.'s, Brighton, Nov. 22nd, at 12. P.E., Brighton C.C., Nov. 23rd, at 11.

E. CHATWIN, builder, Birmingham. First meeting, 191, Corporation Street, Birmingham, Nov. 24th, at 12. P.E., Birmingham C.C., Dec. 18th, at 2.

E. STRINGER, painter and decorator, Bradford. First meeting, O.R.'s, Bradford, Nov. 23rd, at 3. P.E., Bradford C.C., Dec. 6th, at 10.

Coming Events.

Wednesday, November 22.

NORTHERN ARCHITECTURAL ASSOCIATION.—Opening Meeting of Session at 7.30 p.m.
EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. J. A. Morris on "A Scottish Town," at 8 p.m.

Thursday, November 23.

BUILDERS' BENEVOLENT INSTITUTION.—Fifty-eighth Annual Dinner, Hotel Metropole, at 7 p.m.

Monday, November 27.

SURVEYORS' INSTITUTION.—Ordinary General Meeting at 8 p.m.

Tuesday, November 28.

MANCHESTER SOCIETY OF ARCHITECTS.—Mr. R. W. Orme on "Italian Renaissance," at 6.30 p.m.
ARCHITECTURAL ASSOCIATION OF IRELAND.—Mr. P. J. O'Reilly on "The Evolution of the Irish Wheel Crosses," at 8 p.m.

Wednesday, November 29.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. T. Haddon on "A Practical Demonstration of Wrought-iron Work," at 8 p.m.

"CLOISSONNE GLASS" WEATHER RESISTING.

Production 1904—17,000 square feet.

The
CLOISSONNE GLASS
CO.

9^E Berners St., Oxford St.,
London, W.

Prices from 3/- per square foot.

Fire-Resisting Hardwood Doors,

Specially suitable for
HOSPITALS, HOTELS, FLATS, THEATRES, PUBLIC INSTITUTIONS.

REMARKABLE RESULT

of a
FIRE TEST.

A door as shown in the accompanying illustration, built by the Gilmour Door Co., Ltd., was subjected to the Official Fire Test of the British Fire Prevention Committee.

The heat maintained was from 1,600 to 1,700 degrees, and the door withstood the fierce attack of the fire for ONE HOUR.

The door passed the above official test in a most satisfactory manner.

The Gilmour Fire-resisting Doors are not heavy, clumsy, ugly, or expensive. No one could tell them from the ordinary Oak, Mahogany, and other Hardwood Doors.

The use of them means protection to property, and increased safety from Fire.

Architects are invited to inspect the Specimen Doors on exhibition at the Company's or their various Agents' Showrooms, to satisfy themselves as to the construction, quality, and artistic merit.

The Gilmour Hardwood Doors are also NON-ACOUSTIC.

The GILMOUR DOOR Co., Ltd.,

53, BERNERS STREET, LONDON, W.

Also various Agencies throughout the Provinces.

FACTORIES: TRENTON, CANADA.

MONTHLY FIRE SUPPLEMENT

TO THE

BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

Edwin O. Sachs, F.R.S.Ed., Architect,
Consulting Editor.

Number 14.
November, 1905.

FIRE-INSURANCE AND FIRE- PREVENTION.

WE have before us what we believe to be one of the most excellently summarized records of last year's fires and fire-insurance in the form of a series of leaderettes in the "Post Magazine." It is a feat of extraordinary difficulty to be able to summarize this extensive subject in a few pages, and yet give a fair picture of the fires and fire-insurance situation of any given year, and this feat has certainly been attained in more than ordinary efficiency in the "Post Magazine," to which we refer our readers.

When touching on protective safeguards reference is made by this journal to the increasing popularity of sprinklers and similar appliances, also to drenchers, wire-glass, and external shutters for the reduction of the conflagration hazard, whilst the advent of the chemical engine and the motor fire-engine is welcomed as extinguishing appliances.

But what strikes us as extraordinary in this annual leading article of the "Post Magazine" is the manner in which the whole movement of fire-prevention as such has been ignored, whilst, as a matter of fact, this movement of the last seven or eight years has had a most striking effect upon the prosperity of insurance business, and has to a great extent brought about the prosperous fire-insurance years of 1903 and 1904, as far as the British business of British companies more particularly is concerned.

We, of course, know the official aspect of ignoring fire-prevention practised by many fire offices and their senior officials, an aspect which is, however, being rapidly broken down by what we may term the semi-official aspect of academic interest which is now favoured by some few of the more far-seeing of the existing managers and by a large proportion of the head-office departmental chiefs who are recruits for the coming generation of managers, whilst many of the leading branch managers and the leading insurance surveyors most wisely actively further the fire-preventive movement and assist in its furtherance both at home and abroad.

We thus think that the time has now come when the "Post Magazine," even if not seeing eye to eye with some of its older supporters, can quietly but energetically guide fire-insurance opinion in the direction of systematic fire-prevention to the benefit of the fire-insurance world; for regardless of what the official dicta may still be, there can be no doubt, practically and economically, that fire-prevention, with the reduction of unnecessary hazards, pays the fire-insurance companies extraordinarily well. News on questions of fire-prevention is already being extensively recorded in the "Post Magazine's" columns week by week, but editorial comment or advocacy are still lacking.

To put it in the negative sense, we should like to know what the fire losses in the

United Kingdom would have been during the last few years had it not been for the systematic propaganda in the interests of better planning, better construction and better equipment of buildings, including the improvement of existing risks. With the recent amendment of the Building Act, with further impending revision of the building legislation of the Metropolis, the impending revision of the Model By-laws and local enactments, with the improvement of many regulations for individual localities, not to speak of special regulations relating to factories, petroleum, theatres, &c., nearly all the outcome of the systematic fire-preventive propaganda, the insurance companies will find their business of the impending two decades far less hazardous and comparatively easier to operate, regardless of the fact of the rapidly increasing values at stake, owing to the greater quantities and superior quality of articles stored away in individual risks.

The only grave hazard that will have to be contended with during the coming two decades will be that of the conflagration hazard in old districts of large cities, in respect to which it will be difficult to apply fire-preventive legislation retrospectively, although, thanks to the fire-preventive propaganda the companies officially ignore, a precedent as far as safety of life is concerned has been set by the Building Act Amendment Act of last year by making rules for existing property. To take the average life of a building and the growing tendency towards modernizing business premises for other than fire-preventive reasons, it may, however, be assumed that a very great portion of the large business areas of our principal centres will be rebuilt in the next thirty-five years, and will then be rebuilt under the new rules and regulations which the fire-preventive propaganda has already and will have obtained.

We are of course naturally fully aware of the principles that govern the actions of certain managers, more particularly that terribly antiquated "motto" that "a risk is rated as it is found"; we are fully alive to the unwise competition of certain individual managers to show increasing "turnovers" almost regardless of the average hazard being increased. We are also fully acquainted with the ignorant demands so frequently made of insurance companies to reduce rates without a suitable *quid pro quo* having been afforded by the owners or occupiers, and without due regard to the block risk. We know only too well the apathy of the majority of architects in considering fire-insurance requirements, not to speak of actual opposition. We know similarly of the ignorant demands frequently made by certain unscrupulous fire brigades in country districts for unmerited fire charges. But, speaking generally, the fact of the existence of conservatism in certain circles, the ambitions as to turnovers, or the fact that companies are subject to such irritations as are indicated, should not affect the public and energetic furtherance of fire-prevention by the majority of insurance officials, with

the resultant improvement of fire risks generally.

We think that it is a pity rather than anything else that some of our leading commercial institutions such as our insurance concerns should still take so conservative an official view of the question of fire-prevention as to actually believe fire-prevention may negatively effect insurance profits, more particularly as this view has already been semi-officially changed in many directions and must eventually be entirely changed. It is a pity, more particularly from the point of view of the prestige of the insurance world among the building professions and trades.

The apathy in economically obvious matters such as this question of fire-prevention for insurance business has so long been our failing in other departments, which culminated at the time when the Prince of Wales made his notable call upon the community with the words "Wake up, England."

These words are being answered rapidly in various directions, more particularly in the shipping, building and engineering industries, and it is to be anticipated that they will also be eventually responded to in insurance circles. But it would be more pleasurable if this "Wake up, England" dictum were responded to a little earlier by the insurance profession than by other professions; in other words, that the insurance companies should lead in the necessary reaction from ultra-conservatism in business matters, and we trust that when we again see the "Post Magazine's" annual summary we will have observed that the word fire-prevention is no longer absent in the editorial columns, and that it will have a guiding influence in the direction which we consider essential.

The whole trend of the educational movement of the Federation of Insurance Institutes, the impending meeting of the Federation to be held for the first time in London in 1906, and the new classes of the School of Economics, all point towards the more scientific treatment of fire-insurance questions in the direction of fire-prevention in its widest sense, namely, the prevention of the outbreak of fire and the limitation of spread should fire occur.

The Professional Association of Fire-brigade Officers will hold their next executive meeting in London.

There has been a further enquiry under the Fire Inquests Act into the state of the City Mills buildings, which are such a disgrace to the Corporation's area, but unfortunately cannot be dealt with until the Building Act Amendment Act, passed last session, comes into force. The enquiry was conducted by Dr. Waldo, and arose from a small fire that recently again took place there. Dr. Waldo also conducted an enquiry under the same Act into the serious question of petrol hazards in the City area. This arose from a fire that took place on a motor vehicle carrying petrol cans.

DISTRICT FIRE-BRIGADE STATION, RUE MALAR, PARIS.

PARIS FIRE STATIONS.

HAVING published various illustrations of modern fire stations erected in Germany, we are now giving two plans, an elevation and an interior view of a new fire station erected in Paris at the corner of the Rue Combes and the Rue Malar. This is a corner building designed so as to have its ground floor practically entirely occupied by the engine-room and stables, there being room for three two-horsed appliances ready to turn out and also one motor appliance. The space occupied by these appliances is clearly indicated on the plan. By referring to the plan it will be observed that the stables for the horses, although behind the

appliances, are actually in the appliance room, *i.e.*, that the stalls are really divided off by the usual stall furniture and not by partitions reaching to the ceiling. On the first floor will be seen the day room and the dormitory as well as some minor offices, and it will be observed that sliding-poles from first floor to second floor are provided, one in the day room and one in the staircase near the dormitory. The architectural rendering of the building certainly calls for comment, the whole appearance of the station being a dignified one.

We also show an interior view of another Paris fire station where the stables are in the engine-house but the stalls are situated on either side of the appliances.

INTERIOR OF A FIRE-BRIGADE STATION, PARIS, SHOWING STALLS ON EITHER SIDE OF APPLIANCES.

THE UNDERWRITERS' LABORATORIES, CHICAGO.

By William H. Merrill, Junr.

[Below we print a paper by William H. Merrill on the Underwriters' Laboratories of Chicago, in which he holds the position of organizing secretary. The underwriters' laboratories are essentially an insurance institution, for whilst in this country our great insurance corporations pay little or no attention officially to fire-prevention, the American insurance officials take up the position that it is to the interests of their corporation to prevent fire, to prevent the spread of fire, and to limit their monetary risk throughout, keeping the already extra ordinarily high rates within practicable limits and obtaining a greater turn-over than would be the case if the rates were higher than they at present are. The underwriters' laboratories were at first essentially intended for the testing of appliances, and particularly electrical appliances. It has only been of late that they have given attention to matters of building construction, and even now the attention accorded to questions of building construction is not equal to that accorded to it in this country, *i.e.*, no systematic series of tests with building construction have so far been undertaken. The great merit of the American institution is its tests in the interests of electrical safeguards, and in that direction its reputation stands very high.—Ed. B.J.]

The Laboratories.

This experimental bureau was organized in 1893, and originally devoted itself exclusively to testing electrical devices and materials and collecting accurate statistics and reports on fire losses caused by electricity. Later, its work was enlarged to include all forms of lighting and heating appliances and the testing of extinguishers, retardants, and fire-alarm signal systems of all kinds.

Up to the present time tests have been completed and reports issued on more than 2,400 separate systems, appliances and materials. The objects of these tests are to determine the comparative efficiency of all forms of fire-retarding and fire-extinguishing systems and devices, and to secure such safeguards in the construction of all lighting and heating appliances as will reduce to a minimum the hazards incident to their use.

The institution is supported financially by the stock fire insurance companies doing business in the United States, and by fees collected from the manufacturers of appliances submitted.

All tests are carried out under detailed specifications agreed to by the various national organizations representing the interests affected.

In the electrical department the specifications used are those of the National Electrical Code, which is the recognized American authority on safe wiring and safe electrical construction. This code was originally drawn, and is extended from year to year, by a convention to which the following American organizations send delegates:—The American Institute of Architects, the American Institute of Electrical Engineers, the American Society of Mechanical Engineers, the American Street Railway Association, the Factory Mutual Fire Insurance Companies, the International Association of Fire Engineers, the National Board of Fire Underwriters, the National Electric Light Association, the Underwriters' National Electric Association, and the National Electrical Contractors' Association.

The names of such appliances as are shown by the tests to meet the specifications are printed in a list which is issued quarterly. All manufacturers whose names are given in the list are required to enter into a contract with the laboratories covering their factory

practices, and samples of all articles listed are purchased in the market from four to twelve times a year, and re-tested to discover any departure in later factory practices from the standard set forth in the requirements.

This work covers every electrical appliance in common use whose introduction may have any bearing on the fire hazard. It secures the active co-operation of all of the manufacturers in the United States, from the largest to the smallest, all of whom make a practice of submitting new appliances to the laboratories before putting them on the market. In this way hazardous features are eliminated at the outset, and the number of fire losses is correspondingly reduced.

A practice similar to that inaugurated in the electrical work has been followed in the departments since organized, and the lists of approved fire-extinguishing and retarding appliances thus far issued, like the electrical lists, are followed generally in the classifications and ratings of the insurance companies and in the specification of architects, engineers and builders. In a similar manner the disapproval of the laboratories tends to keep faulty appliances out of building equipments.

Over 30,000 copies of the quarterly electrical lists are regularly called for, the quarterly lists of permitted gas machines and systems reach 28,000 copies, and the lists of approved extinguishers, watchmen's time detectors, and other signal systems are coming into quite as general use.

Coupled with the laboratory work in all departments, careful watch is kept on the record in practice of all the appliances covered; more than a thousand correspondents located throughout the United States are reporting regularly to the laboratory organization, and prompt reports are received of the failure or apparent failure of any listed device successfully to perform service. This feature of continuous record of experience is considered quite as valuable in an instructive way as are the laboratory experiments themselves.

In the retardant work gas ovens have been built, the largest capable of reproducing the severest possible fire conditions over an area equal to that of standard-sized fire-doors. The gas used is obtained by pipe connection to the natural gas fields in the State of Indiana, a very large continuous supply being available and the gas being peculiarly well adapted for fuel.

Electrical power is used throughout the laboratories, including the hydraulic department, a recent addition being an electrically-driven fire-pump capable of delivering 500 gallons of water per minute at 100 lbs. pressure. This department, which covers the test work on hose, hydrants, valves, automatic sprinklers, nozzles and similar apparatus, is also equipped with a 5,000-gallon reservoir, a 4,500-gallon pressure tank, a 6in. standpipe 70ft. in height, and a large amount of small apparatus for pressure work and measurements.

In the department devoted to lighting and heating, other than electricity, 380 different makes of acetylene gas generators and 200 devices and appliances using petroleum and its products have been tested and reports issued.

In the electrical department examination tests and reports have been made on 1,650 different devices and materials.

The plant at present occupies one two-storey and basement brick building with yards adjoining, and a storage floor in a second building. Six resident engineers and a total of eleven persons are constantly employed, all of whom devote their entire time to the work.

Each department is supervised by a committee of consulting engineers appointed by the various National Associations having the different subjects in charge, the members

of which are residents of different sections of the United States. All laboratory reports are issued to and reviewed by these committees before being utilized as a basis for the lists of approved or permitted devices and materials issued by the National bodies.

The protective work is covered by a

committee of the National Fire Protection Association, the electrical work by the Underwriters' National Electric Association, and the work on lighting and heating, other than electricity, by the committee of consulting engineers of the National Board of Fire Underwriters.

FIRE-BRIGADE STATION IN THE RUE MALAR, PARIS.

EXISTING BUILDING REGULATIONS FOR PROTECTION FROM FIRE, WITH SUGGESTIONS.

JAMES SHEPPARD, A.Inst.E.E.,
Insurance Surveyor.

(Continued from p. 35, No. 559.)

REQUIREMENTS as to openings in flues for soot doors or ventilators differ considerably in various by-laws. The least space that should be required between such openings and any combustible material is 12ins. In the cases of soot doors the London Building Act requires a distance of 15ins.

The Model By-laws, which in this respect are generally followed, provide that the back of a kitchen chimney-opening and flue in a party-wall shall be 9ins. thick to a height of 6ft. above such chimney-opening and the back of every other chimney-opening not in an external wall shall be 9ins. thick for a height of 1ft. above such chimney-opening. The London Building Act contains no provision for the back of a chimney-opening not in a party-wall, so that in the county of London these may be and are built dangerously thin. The enclosure even of a kitchen flue where more than 12ins. above the mantel may have a thickness of 4ins. only from the inside of the flue to the face of the wall in an adjoining house; this results in numerous fires, many being of a serious nature.

The distance required between any combustible substance and any pipe for conveying smoke or other product of combustion varies from 4½ins. to 14ins. in different by-laws. In some by-laws, where approved fireproof casings are used a space of 3ins. only is required, and the distance required between any timber or woodwork and the upper surface of a hearth in a chimney-opening varies in different regulations from 6ins. to 15ins. It is difficult to understand these differences, as the danger is equally great in all districts. In no case should the distance between a flue pipe and combustible material be less than 9ins., and the distance between the surface of a hearth in a chimney opening and any combustible material below should be at least 12ins.

The by-laws of many districts contain no provision with regard to the front hearths of fireplaces, and consequently these are often improperly arranged with woodwork close to the surface of the hearth. Previous to the Public Health Amendment Act, 1890, no power apparently existed for making by-laws regulating the construction of front hearths, and many regulations have not been revised since that date. It is important that hearths in front of fireplaces should be constructed with incombustible material, as provided in the London Building Act, s. 64 (15), (16), (17), except that slate should not be used for hearths. Hearths of incombustible and non-conducting material at least 6ins. thick, extending 18ins. all round, are usually required under every oven, copper or stove. Gas stoves are unfortunately excluded in the London Building Act, s. 66, but gas cooking stoves have been known to set fire to woodwork upon which they have been placed. Some by-laws further require an air-space of 2ins. below the ashpan and between it and the incombustible hearth. To secure all the advantages this air-space affords it is necessary to keep it free from all accumulation, which is impossible in practice. Solid incombustible non-conducting material is therefore preferable.

Building by-laws usually forbid the placing of timber or woodwork in any wall or chimney-breast nearer than 9ins. to the inside of any flue (the London Building Act requires 12ins.), but the Glasgow Building Regulation Act, 1900, s. 86 (5), and some other by-laws, allow timber or woodwork to be built into a wall as near as 4½ins. to the inside of the flue. It is somewhat surprising

to find such a dangerous practice sanctioned in the Glasgow regulations, which in most other respects are in advance of other by-laws.

Nearly all building laws and by-laws allow wooden plugs to be driven as near as 6ins. to the inside of a flue, and iron holdfasts as near as 2ins. Both of these are objectionable and the cause of fires. In driving a wooden plug into brickwork surrounding a flue it is difficult to prevent displacement (which cannot be seen or repaired) of bricks and plastering on the inside of the flue, causing cavities in which soot collects and ignites, setting the wooden plug on fire, which spreads to any woodwork attached thereto. A fire from this cause occurred at Her Majesty's Theatre, Haymarket, and plugs driven into brickwork round flues for the fixing of wood linings to walls have caused many fires in city warehouses.

Iron holdfasts or other iron fastenings having one end 2ins. only from the inside of the flue, and the other in contact with wood, through which it may have been driven, conducts heat to the wood, which accumulates it sufficiently to cause ignition under favourable circumstances. This occurred at a London mansion, where woodwork round a spike fixed in the way described was ignited, the fire being discovered and extinguished early enough to show its real cause.

In a City printing establishment woodwork in contact with a steel joist was set on fire by heat conducted along the joist for a distance of 2ft. from its end, which rested in a flue from a stereotyping furnace.

In a country house a fire was caused by a tie rod fixed to wood joist on first floor and through the flue from kitchen range to a tie-plate on the outside of chimney stack. A girl was burnt to death beyond recognition by this fire.

At some works on the Thames the heads of timber piles embedded in clay 2ft. 6ins. below the hearths of a bed of pyrites burning furnaces, were completely carbonized by heat conducted through the above depth of concrete and brick arches to iron girders resting on the heads of the piles.

A small house in Bethnal Green was set on fire by heat conducted through spikes driven into brickwork round a flue of the adjoining house, for the fixing of the string of stairs. By this fire ten lives were lost.

The foregoing are sufficient to show the danger of placing woodwork against any iron which may be subject to fire heat at any point. The usual practice of running steel joists for concrete floors into flues and placing wooden bearers and floor boards on the steel joists should be avoided, and the metal joists trimmed round flues as now required for wood joists.

Many fires involving loss of life result from the careless setting of stoves and chimney-pieces at the back of which vacant spaces are left, where soot collects and becomes ignited, communicating fire to the skirting and floor or other combustible material near. A rule should be inserted in all building laws and by-laws requiring stoves and chimney-pieces to be set perfectly solid with suitable incombustible material. Coke-breeze concrete should not be used for this purpose, as in such position it has frequently been found to be in an incandescent condition. Disastrous fires, the causes of which could not be traced, have doubtless originated in this way. Regulations to guard against these dangers are not so far as is known contained in any existing building law or by-laws.

Chimney-openings and flues not used for the purpose for which they were constructed are frequently the cause of disastrous fires. Such openings and flues when stopped with boarding or other combustible material collect soot, dust and light refuse, which fall down the flue; these accumulations are often ignited by a spark passing through a defective division between the disused flue and an adjoining flue in use, or by a spark from a chimney near, or from a fire in the neighbourhood falling down the flue. The flues from all unused fireplaces should be closed with brickwork 9ins. thick immediately above the chimney opening, and the

top of flue closed by a stone or tile. If the flue is required for ventilation, a suitable cowl or other appliance that will effectually prevent the entrance of sparks should be fixed. All such ventilating flues should be cleaned out every twelve months. The Glasgow Building Act, 1900, is probably the only regulation containing provision to guard against the serious danger resulting from disused chimney-openings and flues.

In London and Dublin hot air and high pressure steam pipes are required to be 6ins. from any combustible material, and high-pressure hot water pipes 3ins. distant. Only a few by-laws contain provision of this nature, but it is desirable that they should have general application.

The London Building Act requires the floors of rooms over furnaces and ovens, if within 18ins. of the crown of the oven or furnace, to be of fire-resisting material. This rule should be included in all by-laws.

The regulations of only two cities, London and Glasgow (so far as is known), contain provision with reference to adapting existing flues for any new oven furnace, cockle steam boiler or close fire, used for any purpose of trade or business, or to or for the range or cooking apparatus of any hotel, tavern or eating-house, unless the flues be surrounded with brickwork at least 8½ins. thick, from the "floor on which such oven, &c., is situate, to the level of the ceiling of the room next above the same," and in one of the cities, very properly, higher if required by the authorities. The danger arising from using old flues for new furnaces is the same in all cases, and provision with regard to such objectionable practices should have general application. Several country hotels have been recently burnt down with loss of life; these fires may have originated from the use of existing flues not meeting the requirements of above regulations.

Fires frequently result from the defective fixing of gas pipes and the improper use of soft metal or rubber tubing, and fires caused by ignorant or careless work in connection with electric light or power conductors and fittings are rapidly increasing in number. Appliances in connection with acetylene gas are also a source of danger to life and property. It is desirable to control each of the foregoing by suitable regulations in all building by-laws. Glasgow Regulations (s. 113) provide for the control of electric-light installations; power installations should be included.

The tables on page 45 give, in the terms used in the annual official reports of the chief officers of the fire brigades of the cities named, the number of fires caused by defective construction in the respective districts, showing that such fires amount to a large proportion of the total number included in the returns.

Taking only the fires for which causes are recorded, the proportion of the total of such fires resulting from defective construction in each case, for the five years 1897-1901, is as follows:—

London	-	-	-	15.4 per cent.
Liverpool	-	-	-	17.0 "
Glasgow	-	-	-	42.5 "
Manchester	-	-	-	13.7 "
Birmingham	-	-	-	27.3 "
*Dublin	-	-	-	27.0 "

* Four years, 1898-1901.

The above proportions are probably below the true percentages, especially in London, where the proportion of fires the causes of which are unknown are from 3 to 5 times greater than in some other cities. A far larger proportion of the fires the causes of which are returned as unknown result from defective construction than is the case with fires the causes of which are ascertained. Fires of unknown origin moreover comprise nearly all disastrous fires and conflagrations, which usually destroy all evidence of their cause.

The large proportion of fires in Glasgow

arising from defective construction is explained by the practice in that city, up to 1892, of placing timber and woodwork in close proximity to the inside of flues or chimney-openings and the surface of hearths. The application of provisions in the Acts and by-laws of 1892 and 1900 will no doubt gradually reduce such heavy proportion, but to secure this to the fullest extent it will also be necessary to bring the Glasgow regulations into line with those of most other cities, and require a distance of at least gins. filled with solid brickwork between the inside of all flues or chimney openings and any timber, woodwork or other combustible material, and require the outer face of brickwork about such flues or chimney-openings within the building to be plastered.

(d) Rules adopted with the view of retarding the spread of fire throughout the building in which it may originate, and for preventing its extension to surrounding buildings.

The general construction, thickness, recesses, chases and piers of the walls of buildings as provided in building regulations are usually sufficient to guard against the spread of fire from collapse of the building or walls, but the use of stone should be discouraged by requiring greater thickness than is provided in most by-laws. The erection of buildings on accumulations of ashes, slack or furnace slag should be forbidden, as underground fires or decomposition occasionally occur amongst such substances.

The cubic capacity and height of a building are important factors governing the spread of fire, but apparently the building regulations of only three cities contain any restrictions on the extent and height of a building.

The Liverpool Fire Protection Act, 1843, restricts the size of a warehouse to an area of 4,000 super. ft. and a maximum height to the eaves of 65ft. The extent of sheds are also restricted.

The London Building Act, 1894, restricts the extent of a warehouse building to 250,000 cub. ft.; this is an addition of 34,000 cub. ft. to the capacity allowed in the repealed Act of 1855, and the present restriction is far more limited in its application, as the former Act applied the restriction as to size to "buildings used wholly or in part for the purpose of trade or manufacture" as well as to warehouse buildings.

Buildings in London are restricted to a height of 80ft., exclusive of two storeys in the roof, and in new streets less than 50ft. wide the height of a new building is restricted to the distance between the new building and the nearest wall of the building opposite. The authorities have powers in stated conditions to sanction additions to above rules up to 450,000 cub. ft. if less than 60ft. in height.

In Glasgow buildings of the "warehouse class," which term in Glasgow has a far wider application than in London, are restricted to 350,000 cub. ft., with power to sanction up to 750,000 cub. ft. in certain conditions. The height of buildings is generally restricted to that of 1½ times the width of the street, in no case exceeding roof. from the level of the street to the ridge of the roof; tenements and dwelling-houses must not exceed in height the width between the building lines of the street upon which they abut.

Several buildings adjoining or in close proximity to one another, each being of the smaller capacity named, involve great danger of most serious conflagrations unless stringent regulations as to external iron doors and shutters, party-walls and other special provisions are adopted, as in the Liverpool Fire Prevention Act.

If the owner of a building requires it to be of such extent and height that it would in case of fire seriously endanger surrounding premises, it is only reasonable that he should

be required to make every possible provision to guard against such damage to his neighbours.

Party-walls and their height above roofs constitute an important provision against the spread of fire. This in London in the case of a "warehouse building" exceeding 30ft. in height must be 3ft. above the roof, flat or gutter of the highest building adjoining, and in other cases 15ins., and in all cases 12ins. higher and wider than any turret, dormer, lantern light, &c., within 4ft. from such party-wall, and above any part of any roof opposite and within 4ft., and must project 4ins. beyond eaves and wood cornices.

The above provisions agree with corresponding provisions in the Model By-laws, but have not been found sufficient to prevent the spread of fire, especially where curb or mansard roofs covered with slates and zinc have existed near the burning building. In most provincial towns the restrictions are less stringent, and in some cases the building of party-walls up to the roof covering only is allowed.

The height of 3ft. for party-walls should apply to all the party-walls of a building any portion of which may be more than 30ft. in height so as to provide reasonable protection between roofs and skylights forming part of the building that may be at a lower level than 30ft.

The form and covering of the roof is quite as important as the height of party-wall, but this has received but little attention. In London the pitch of the roof of a "warehouse building" is restricted to 47 degs. with the horizon, and of other buildings 75 degs., and must in all cases be covered with slates, tiles, metal or other incombustible material. The regulations of other cities only provide that the covering must be of incombustible material. In Glasgow, if the roof has a steeper pitch than 45 degs. parapets or provisions for firemen being upon such roof must be provided. In London every dwelling-house or factory exceeding 30ft. in height, and having a parapet, must have means of access to the roof. There appears to be no rule requiring a parapet to be provided.

The foregoing regulations permit of very large quantities of combustible material being placed in a way that allows of its rapid burning on the highest part of a building covered only with slates or zinc, which, experience shows, are insufficient to prevent the ignition of the woodwork they cover. To obtain reasonable protection in districts crowded with warehouses flat solid roofs are needed. If others are allowed, they should be constructed entirely of incombustible material covered with tiles or copper.

In London openings are allowed to be made in party-walls subject to stated conditions, but such openings are required to be protected by two iron doors, one on each side of the wall. The regulations with regard to such openings and doors would be greatly improved if the use of stone for jambs and heads were forbidden, in place of being specially permitted, and a regulation inserted requiring the provision of bolts for securing the doors to the iron frames in the centre, top and bottom, with lugs on the hinge side of the door fitting into slots in the frame on the closing of the door. In the case of large doors additional fixings of this nature should be required. This would prevent the warping of the doors under the action of heat and avoid most of the failures that frequently occur with iron doors.

The Liverpool Fire Prevention Act and the Glasgow Building Act, 1900, contain similar provisions to the foregoing for openings and iron doors in party-walls, but as limitation of cubic capacity is not usual in other by-laws, provisions as to iron doors are not made.

(To be continued.)

COLSTON AVENUE FIRE, BRISTOL (NOVEMBER 4TH).

DIGHTON STREET FIRE, BRISTOL (OCTOBER 25TH).

FIRES AT BRISTOL.

BRISTOL has been subjected to several serious fires during the last few weeks, and we are illustrating a plan and two views of the fire that occurred off King's Square, and also a photograph of the fire at Messrs. Pickford's premises.

We are indebted to Mr. Charles E. Goad for the plan of the major portion of the site of the King's Square fire, which attacked the premises on both sides of Dighton Street.

The King's Square fire started on Wednesday, October 25th, 1905, and was first observed about 5 a.m. Information was given by a police constable to the Central Fire Station at 5.30 that a fire was well alight in St. James's.

Two factory buildings, each of five floors, one used for the manufacture of clothing and the other of bookbinders, were very quickly fully involved and eventually entirely destroyed; the walls fell into the streets and crushed buildings on the opposite side of the narrow lane, known as Princess Row.

Both factories were constructed with timber beams and open joist floors supported on iron columns and covered with timber-slatted roofs. Lifts passed through the floors.

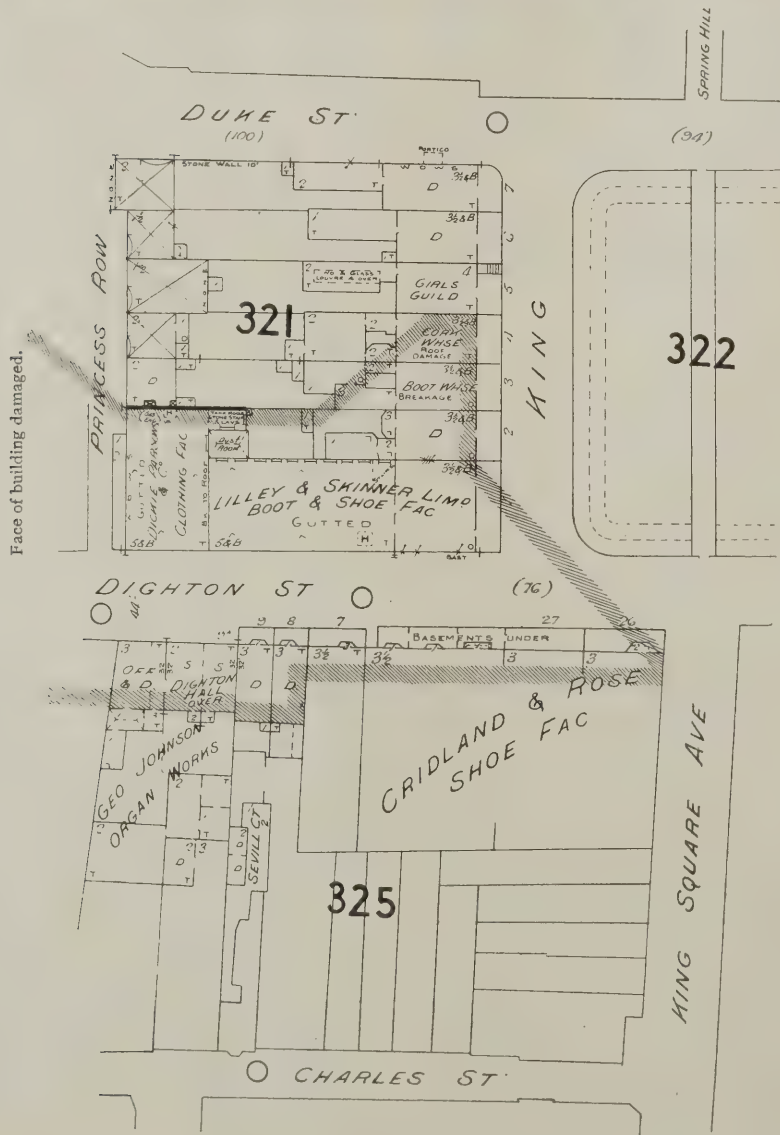

The stone steps of stairs through all floors in each factory have all fallen, but the brick wall partly enclosing these stone stairs remained standing after the fire.

The wall separating the factories was very imperfect, not being apparently in accordance with the building regulations in force when it was erected.

The lax administration of existing building regulations as demonstrated in this fire, together with the absence of a duly organized fire-alarm system in a city like Bristol, is not creditable to the authorities, resulting as it does in excessive destruction of property and the throwing out of employment of hundreds of workpeople, many of whom may be thrown on the rates.

It is also probable that the size of mains and pressure of water were in this position both insufficient for the control of fire in buildings of the character of those destroyed.

The extent of the fire is indicated on the plan annexed, but much damage has also been caused by smoke, water and breakages outside the limit shown.

PLAN OF FIRE, KING SQUARE AND DIGHTON STREET, BRISTOL (OCTOBER 25TH, 1905).
BY CHARLES E. GOAD C.E.

Regarding the second fire of November 4th, the premises were situated in a block lying between Host Street and Colston Avenue, and involved those of a well-known firm of carriers and a firm of printers whose premises were adjoining, the distance between the two streets being about 110ft., which figure gives the depth of the blocks in question. We also do not consider this fire at all creditable to the city of Bristol.

In the second fire the total loss may be computed at about £35,000, of which £25,000 were lost in property to which the fire spread, *i.e.*, in risks adjoining the scene of outbreak.

In the first-named fire the loss may be computed at about £45,000, and here again £35,000 may be considered to have been lost solely to the fact that the fire spread beyond the building in which it originated.

It is when fires of this kind occur, involving a substantial loss of property through causes easily avoidable, that the nation feels the absence of any machinery for an immediate independent official enquiry as to the reason of such fire waste. For individual firms to boast that they are insured, and for insurance companies to pay promptly the losses involved, in no way discounts the fact that the community has lost a large amount of money which it has to contribute as insurance premiums at a higher rate than would be necessary if proper safeguards were adopted.

Apart from the direct loss, there is a considerable indirect loss—loss of business, loss of employment—and such fires frequently result in the unemployed being put upon the rates, which again creates a further tax upon the community.

FIRE TESTS.

A Roller Shutter from the United States.

A REPORT has been issued by the British Fire-Prevention Committee (No. 100) in respect to a steel roller shutter door, known as Messrs. Arthur L. Gibson & Co.'s "Kinnear" door (made in the United States), and this test has demonstrated the possibility of constructing a light roller shutter door on principles by which the expansion of the metal is provided for, so that the shutter does not break away under stress of fire.

The test undertaken was with a roller shutter that covered an opening measuring 9ft. by 9ft., *i.e.*, an opening larger than that permissible under the London Building Act. The nett result of the test was that the shutter stood up but bulged, the bulging being due to the flame coming over the top of the shutter. No flame whatever actually got through the shutter or the joints in its surface.

The test was one for 1½ hours under the usual conditions of the Committee, the temperatures rising to over 1,800 degs. Fahr.

We understand some further tests are to be conducted in January with doors of similar construction, both single (automatic) and double. We give an illustration of the door which appears in the reports referred to.

Concrete Aggregate Tests.

The Committee in the course of the last week of October undertook the series of important fire tests with seven different forms of concrete in general use to which we referred in our last supplement. The object was to obtain definite information as to their comparative fire-resistance.

The sub-committee in charge of the test comprised Mr. Max Clarke, F.R.I.B.A. (directing member); Mr. J. Herbert Dyer (vice-president, National Fire Brigades' Union); Lieut.-Colonel Winn, R.E.; Mr. A. T. Walmisley, M.I.C.E. (Dover Harbour Board); Messrs. Dicksee, F.R.I.B.A., and Grellier, F.R.I.B.A., (district surveyors); Mr. Oswald C. Wylson, F.R.I.B.A.; Mr. E. J. A. Fulkes (Royal Insurance Co.), and Mr. Garbutt, A.M.I.C.E. (Metropolitan Railway).

The concrete floor bays under investigation,

as already reported in detail, comprised bays of (1) slag concrete, (2) broken-brick concrete, (3) granite concrete, (4) burnt-ballast concrete, (5) coke-breeze concrete, (6) clinker concrete, (7) Thames ballast concrete; the cement used being British "Ferrocrete" cement provided by the Associated Portland Cement Manufacturers, Ltd., who co-operated in the arrangement of the test, the load on each bay being 2 cwts. per ft. super. The test was of three hours' duration at temperatures up to 1,800 degs. Fahr., followed by the application of water from two branches of a steam fire-engine for three minutes.

Pending the official detailed report, the following may be roughly taken as the general result of the test, namely, the decisive failure of Thames ballast concrete as a fire-resistant and the success of the clinker, broken brick, coke-breeze and slag concrete bays.

We think the test should have gone on for four hours, when the result would have been more decisive to the lay mind, for no doubt by that time the Thames ballast bay would have entirely collapsed.

Other Tests.

The other testing operations during the week in question further included one with a floor, one with ceiling slabs and one with four stanchion encasements.

The floor was of reinforced concrete constructed on the Coignet system, measuring 22ft. by 15ft., and divided into three bays. The test was for classification as "fully protective" (Class A.), which requires that fire and water shall not pass through during the test of 2½ hours duration at temperatures reaching over 1,800 Fahr., followed by the application of water from a steam fire-engine for two minutes, the superimposed load being 2 cwts. per sq. ft. The floor attained classification, but deflected several inches. The test was carried on to three hours, the load being 2½ cwts., *i.e.*, under conditions exceeding those for the above classification.

The test with ceiling slabs was with zin. Cullum pumice slabs applied for the protection of ordinary wood joist floors, the test being for purpose of classification as affording temporary protection (Class A.), *i.e.*, which classification requires a test of three-quarter hours duration to a temperature exceeding 1,500 degs. Fahr., followed by the application of water for two minutes. Neither fire nor water reached the wood joists, and the ceiling slabs attained this classification.

The tests with the stanchion encasements were with four stanchions protected by four different kinds of porous brick encasements (two circular and two square) on the Jabez Thompson system, the test being of 2½ hours' duration, followed by the application of

"KINNEAR" ROLLER SHUTTER DOOR AFTER 1½ HOURS FIRE TEST (SEEN FROM INSIDE).

DETAIL OF CONCRETE AGGREGATES FIRE TEST, SHOWING THE BAYS UNDER INVESTIGATION.

water for two minutes, the stanchions to be loaded. Three out of the four stanchion encasements afforded protection, two round and one square.

The directing members of the sub-committees in charge of these three tests were respectively Mr. Ellis Marsland (district surveyor), Mr. James Sheppard, A.I.E.E. (insurance surveyor), and Mr. Oswald C. Wylson, F.R.I.B.A. The official reports will be issued in due course.

Impending Tests.

The following impending tests were officially announced, namely:—(1) A second experimental test by the Committee with a concrete floor of broad flange girders with cross joists, no cleats or bolts being used; (2) a second test by Messrs. Coignet, of Paris, with a reinforced concrete floor, to be constructed under the new fire office rules; (3) a floor by the New Expanded Metal Co., arranged to demonstrate the fire-resistance of certain girder encasements; (4) two roller shutter doors of the "Kinnear" type by Messrs. Arthur L. Gibson & Co.

THE INDIANAPOLIS CONFLAGRATION.

By T. M. Goodloe.

THE fire at Indianapolis, U.S.A., which occurred this year, as far as can be ascertained originated in the kitchen of a hotel and immediately communicated by means of windows on the first floor to a wholesale millinery house composed of two buildings. Above the window through which the fire was communicated was a large areaway, or light shaft, running from the first floor to the roof, and the building being fully stocked with spring goods, preparatory to their spring opening to have been held the following day, it was a matter of only a few minutes before the entire building was burning.

The heat was so intense as to ignite the frame windows in two buildings across a 40ft. street on the east. These fires, however, were soon extinguished. On account of numerous unprotected openings in the south wall of the millinery store, and also in the buildings adjoining and exposed on the south, it was seen at once that it would be impossible to save the buildings fronting on Louisiana Street, and the efforts of the department were devoted to preventing the fire spreading north.

The building adjoining the millinery store on the north was occupied by the A. Kiefer Drug Company, a fully standard equipped plant, with water supplies from 4in. connection from the city mains and an 18,000-gallon gravity tank. Adjoining the Kiefer Drug Company on the north was the wholesale millinery house of Griffith Brothers, with no protection except automatic alarm, all floors being pierced by two light shafts, two elevator shafts and one stairway, unprotected. On account of the south-west wind, which,

however, was not strong, the flames were fanned against this five-storey millinery house of Griffith Brothers, and the composition roof thereon soon ignited; in a very few minutes this building was entirely ablaze, the flames quickly spreading to the adjoining building on the north, occupied by druggists' sundries, by means of the hot walls. In the meantime an explosion (caused no doubt by the intense heat of the walls on either side of the building) occurred in the Kiefer drug risk, blowing a hole in the south wall about 40ft. long on the third floor.

All this happened within twenty minutes, making the fire much beyond the control of the local fire department. After a hurried consultation between the assistant chief and the chief, it was decided not to use the steamer for the steamer connection of the sprinkled risk, thinking that the engine could better be used towards preventing the spread of the fire across the alley on the north, rather than attaching to a connection in a building that seemed already doomed. The department was successful in preventing the spread of fire across the alley, there being 30 per cent. water and smoke damage in building 234-6, South Meridian Street, and 60 per cent. smoke damage on millinery stock in 221-3, McCrea Street.

The walls in the entire block were alight, those between the Fahmley & McCrea millinery house and Kiefer drug risk being 16-16-12-12-12, and the walls between the Kiefer drug risk and the millinery house on the north being 12ins. all the way up. The wall between the millinery house and the druggists' sundries on the north was 16ins. all the way up. Thus, it will be seen that the sprinkled risk was destroyed because of the lightness of the walls on either side. The fire went through the solid walls between 238 and 240, South Meridian Street, between 234 and 236, and between 230 and 232.

In the wall between 228 and 230, South Meridian Street, and 225 and 227, McCrea Street, there were seven old windows covered with corrugated iron and plastered over. This wall was supposed to be a solid wall. The fire, however, did not get through these openings, strange as it may seem, although it did spread to the building 221 and 223, McCrea Street, which is some 50ft. west of where the fire started.

"The natural conclusions from the fire, or rather the most reasonable ideas to be formed, are that interior protection, no matter how good, is of no service in a risk when separated by thin walls from adjoining risks when such adjoining risks are seething furnaces. The spread of the fire only emphasizes the necessity of protecting vertical openings, building heavier party-walls in congested districts, and last, but not least, outside protection in sprinkled risks. This latter has evidently been overlooked in most cities, as we find numerous other risks here and elsewhere thoroughly protected inside but with nothing on the sides or roof to protect the property against the ravages of fire and heat in adjacent properties."

Correspondence.

Lift Wells in Buildings.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The subject of the prevention and alleviation of fire is admittedly a very important one, particularly in London, and I therefore venture to hope that you will kindly find space in your valuable paper for this letter, in which I propose to call attention to a fact which, although perhaps well known to those who have experience of fires, is yet, I fear, quite unknown not only by the general public but by the majority of the great body of architects and surveyors.

It has always been the custom to regard a staircase or a lift well as the most dangerous part of a building in case of an outbreak, because as there is always a draught therein the fire rises with great rapidity and frequently cuts off all communication and means of escape by stairs or lift as the case may be.

I would, however, point out that such a well being a necessity in a building, it is very advisable to let it be as clear as possible from the lowest floor to the top, so that if a fire does break out and attacks the well (as it invariably does sooner or later) the flames may be able to rush up the well without any serious check and vent themselves vertically and not be driven out horizontally.

If this point be always kept in mind when planning a building I feel sure that a great deal of damage and loss of life would be averted, especially in London, where there is an efficient fire brigade generally on the scene of conflagration within a few minutes of the outbreak.

Let me give you a recent case by way of example. A short time ago a fire broke out in a large building in the City. The cause appears to have been the fusing of an electric cable, and the fire started in the basement and went up the lift well. Now it happened that the lift was at the top of the well and the roof above was comparatively a stout one. What was the result? The flames, checked by the left cage and the roof, diverged horizontally on reaching the top floor and found their way along the corridor for a distance of 50ft. or 60ft.—on the floor below to a shorter distance, on the floor below that to a shorter distance still, and so on floor by floor down to the ground floor, where there was comparatively little damage done. It happened that the fire brigade were on the scene within about a minute of the outbreak and quickly checked the fire, and it was in consequence of this that exact observations could be made.

My contention is that if the lift had not been at the top, and the roof instead of being a stout one had been an ordinary skylight, the damage done would have been much slighter to the corridors, and the fire would have been practically confined to the lift well.—Yours truly,

WALTER E. MARKHAM.

LONDON, N.

THE
BUILDERS' JOURNAL
AND ARCHITECTURAL RECORD.

November 29, 1905. Vol. 22, No. 564.

6, Great New Street, Fetter Lane, E.C.

Summary.

In constructing high office buildings, or skyscrapers, three methods are available—masonry, steel framework, and reinforced concrete. Masonry has its limits, by reason of the thickness of wall required at the base, and it is not practicable to build skyscrapers in this way to more than ten or twelve storeys. Skeleton steelwork has no such limitation, but in respect to the essential part—the actual support or column—the greatest care is needed in calculating stresses, and in framing columns and their connections. In reinforced concrete the first skyscraper was the Ingalls building at Cincinnati, begun in 1902. This is 50ft. by 100ft. on plan and sixteen storeys high, reaching 210ft. above the pavement. (Page 306.)

Three Italian architects have been appointed to complete Count Sacconi's huge monument to Victor Emmanuel at Rome. (Page 317.)

The Society of Architects has given fifty guineas to the Architects' Benevolent Society. (Page 317.)

Wallpaper Manufacturers, Ltd., the huge combine with a capital of £3,200,000, has made a profit of £243,227 during the past year, and the directors recommend a dividend on the ordinary shares at the rate of 8 per cent. The company has purchased the Lincrusta business of Messrs. Frederick Walton & Co., Ltd. (Page 314.)

Mr. Dawber offers to all members of the Architectural Association a hearty welcome to his "At Home" on December 8th. (Page 311.)

In Sweden to-day there are three tendencies among architects: first, the "eclectic" school, who go where they think the suggestions for the problem in hand are the best—one day Italy, next the Isle de France or England, or maybe Spain; secondly, the "national" school, who contend that the only way is to continue the tradition of their own country reverently and intelligently; and thirdly, the "individualistics," who probably include the most resourceful of the designers, even if some of their work is so new that the shock when first seen is difficult to get over. (Page 309.)

The work of restoring the church of St. Columb Major, Cornwall, has now been completed under the direction of Mr. G. H. Fellowes Prynn. (Page 317.)

Ten architects have been selected to submit designs in the competition for a secondary school and technical institute at Luton. (Page 309.)

Mr. A. W. Mills, architect, of Manchester, died last week. (Page 309.)

Serious strikes in the American building trade are threatened. A demand of 2s. more per day is made by the men. (Page 314.)

Barge-boards. ONE of the little delights that the architect and builder in the suburbs and provincial towns indulges in is the sham barge-board. These seekers after the quaint and the picturesque in domestic architecture are, however, only conforming to the general spirit which seemed to possess architectural students of the last century, namely, the sketching fervour. Students go all over the country sketching nice little bits that they think will come in very handy for incorporation in their after-practice. They little understand the reasons why these forms came into being, neither when they exemplify general principles or are the outcome of peculiar local conditions or circumstances not likely to recur in any other problem. The barge-board as now used is more often than not nailed on to the wall, and we have even seen architects go so far as to model it in cement plastering and paint it, which is only equalled by the instance of an old theatre at Islington where sham half-timber work is painted on a plaster surface. The barge-board had formerly a particular constructive use. It was not employed without reason nor used simply as a fanciful decorative detail. Its use was to take the place of a barge-couple, or to protect the rafter of the same. The barge-couple is the name for a rafter which carries the portion of the gable roof projecting beyond the gable wall. The barge-couple must be carried by something, and support is usually given by running the horizontal timbers of the roof over the gable wall, namely, the plates, ridge pole and purlins, although occasionally one finds barge-couples as separate timbers supported underneath by brackets. These rafters are occasionally moulded and ornamented, but generally they are covered by barge-boards which prevent the rain driving in, though this protection has often been rendered futile by the piercing of the boards in the fanciful manner of the Elizabethan period. The barge-board is essentially appropriate to a half-timber building, because in such a system of construction it is impossible to have resort to a coping to protect the top of the wall. The overhanging roof serves this function, and of course it can be used similarly to serve as a coping in brick and stone construction by being run over gable walls and over eaves; but if this is done it certainly needs to be carried over a good way, and this does not seem so sensible or harmonious a way to protect the walls of a building from the penetration of rain where a block of two or three houses is built and the by-laws require the party-walls to rise above the roof for purposes of preventing the

spread of fire. The indiscriminate use of barge-boards is simply absurd. It is, if anything, worse than with battlements. We are getting to be more reasonable in the planning of buildings, and do not seek to gain picturesqueness at the expense of convenience in arrangement, but we need to effect some reform in the decorative architectural detail of modern architectural practice, which is too often the result of cribbing without understanding.

A Voice from Italy. READERS will doubtless recollect that some weeks ago we gave particulars

of the huge national memorial to Victor Emmanuel which is being erected on the Capitoline Hill at Rome. "An Englishwoman in Italy" writes to the "Morning Post" and raises some questions of considerable interest—questions which have an application quite outside this particular subject. The English, she says, are inclined to regard Italy "as a subject State whose *raison d'être* is to enable them to bask in the sunshine, revel in cheap pensions, and wear their old clothes," and critics talk about Italy and her monuments in a way which, it is suggested, is quite too patronising. This Englishwoman in Italy observes that "the Italians probably have their own opinions upon the pagoda erected to the Prince Consort, also on the failure of any suitable memorial to the first Empress of India; but they do not express it. . . . Modern Italy is full of life: to her belongs the future, her industries are flourishing and will soon free her from the yoke of the foreigner; her finances are on a sound basis; so why are modern Italians expected to hustle out of Rome the monument which is the immortal consecration of the King who represents to them the new order of things, in order to spare for archæologists a few interesting but unimportant landmarks?" We do not doubt the justice of these remarks; but so far as the cost of the memorial goes, if we in this rich country have had to cut down the scheme of the memorial to our late great Queen because sufficient funds are not forthcoming, it seems rather disproportionate for a country like Italy, which (however hopeful its future may be) is certainly not a rich country at the present moment, to indulge in a memorial like that to Victor Emmanuel, the cost of which down to the end of last year was about £750,000, the monument being then still far from completion. We note that three Italian architects are to carry on the work of the late Count Sacconi (see page 317 of this issue), and that some disapproval of the choice is expressed.

SKYSCRAPERS.

WITHIN the last week or two there has been a revived interest in the skyscraper, and some speculation has been made as to the likelihood of its appearance in London. Mr. Denell's paper before the Institute also directed attention to the subject. It is opportune, therefore, to give some practical details as to the design and building of the skyscraper.

Methods of Construction.

The methods of construction available may be classed under three heads—masonry construction, skeleton steel construction, and reinforced concrete construction. Masonry construction, depending on solid walls, is practicable to a certain limit only—the limit being usually about ten or twelve storeys—for the reason that beyond that height too much valuable space would necessarily be sacrificed to walls. According to a table prepared by Mr. F. E. Kidder, the city ordinance requirement for a twelve-storey building in New York is 40ins. thickness for the first storey exterior wall. The building law of Boston requires 36ins. for the same wall; St. Louis, 34ins.; Denver, 30ins.; while Chicago is satisfied with 28ins. On the basis of the New York requirements, a

building 300ft. high would require a wall 7ft. thick, so that masonry construction may be dismissed from the skyscraper problem.

The first advance from masonry construction was the use of cast-iron columns, which were protected with fireproof coverings. But since the possibilities of steel construction became known very little use has been made of cast-iron for columns. One reason for its disuse is the difficulty of making satisfactory tests of its strength, owing to the possibility of the shifting of the core in casting. When steel columns were first used in high buildings they were merely to support the floor loads, as in the "World" building in New York, which is 199ft. to the roof line, with self-sustaining brick walls faced with sandstone and terra-cotta, the thickness of the wall being 11ft. 4ins. at the bottom and 2ft. at the top. The steel columns were let into chases in the wall in the lower storeys and set free above.

The Skeleton Steel Frame.

The next step in high building construction was the skeleton steel frame, in which all floor and wall loads are transmitted directly to the columns and by them to the foundations. The girders of each floor are calculated to carry the floor load and exterior curtain-wall for that storey, thus eliminating

the necessity of exterior walls except for protection from the weather. The thickness of these walls varies. The Chicago building law requires that the curtain-wall of a building 250ft. high shall be 12ins. thick for the first 150ft. from the top, 16ins. for the next 50ft., and 20ins. for the lower 50ft.

The most essential part of the construction of a skeleton steel frame is the actual support or column. Other parts of the structure may be weak without causing more than local damage, but when a column fails the entire structure is liable to fall; hence the greatest care of architect and engineer must be used in calculating stresses and in framing columns and their connections.

Reinforced Concrete.

The first skyscraper to be built on this the third method of construction was the Ingalls building of Cincinnati, O., begun in 1902. For the reinforcement cold-twisted square bars were used throughout. This system greatly increases the tensile strength of the bars after twisting and increases the mechanical grip of the bar on the concrete. The Ingalls building is 50ft. by 100ft. on plan, sixteen storeys high, 210ft. above the pavement and 20ft. below to the bottom of the foundations, which are also of reinforced concrete. The exterior walls are faced with marble

ADDITIONS TO ALL SOULS CHURCH, HAMPSTEAD. NICHOLSON AND CORLETTE, ARCHITECTS.

This work was commenced in 1904 and has recently been completed. The church consisted of a nave and apsidal chancel with a north aisle and bell-cot. A south aisle has been added, and the singularly ugly west front masked with a new tower forming a baptistery and belfry. The old bell-turret has been remodelled and the entrances have been rearranged. The old roof has been ceiled and re-slatted, the north aisle covered with copper, a new font has been placed in the church, and a new reredos is in hand. The materials used are stock bricks and Portmadoc slates, the south aisle being leaded and the saddleback tower covered with red pantiles. The peculiar plan of the west end was necessitated by conditions of frontage. The architects were Messrs. Nicholson & Corlette, of London, and the builders Messrs. Leaney & Co., of Southend. The drawing reproduced above was exhibited at this year's Academy.

This house was designed by Mr. John Cocker, architect, of Altrincham, merely as a stock example, to be built with a red Runcorn stone base, local common bricks, rough-cast, and flag roof.

for the first three storeys, glazed grey brick for the next eleven, and glazed white terracotta for the last storey and cornice.

That steel encased in concrete is perfectly preserved from rust is well known, and if more proof of this were needed it could not be better supplied than by the demolition of the Plaza Hotel in New York within the past month or so. This hotel was built about 1879. The steelwork disclosed was found to be in excellent condition everywhere—even the floor-beams of the kitchen and laundry, where there was much chance of moisture reaching them, being quite unaffected by rust. This fact is all the more noteworthy when it is stated that the framework had not been protected by paint or any other preservative.

Foundations.

In New York City when it is necessary to go to great depths for foundations the pneumatic process is successfully employed. In Chicago a system of grillage, on piles, of I-beams and concrete has been in use for several years. And now that reinforced concrete piles are available, and do not have to be cut off at the water-line to prevent decay, we have a fireproof, windproof and practically indestructible building as the result.

In view of the possibility of conflagrations liable at any moment to temporarily jeopardize the business interests of every city, it is considered that the requirements in regard

to materials and construction of buildings in such districts should be most rigid and comprehensive in every detail.

Can Skyscrapers be made to Look Satisfactory?

With reference to the aesthetics of the skyscraper, we may quote from a paper read by Mr. Edward S. Hammatt, architect, before an American society recently. We must remember, he says, that our aesthetic training is based on the proportions of Classic architecture—the low buildings of the Grecian archipelago. We are appalled at the seeming hopelessness of reconstructing our aesthetic ideas on such a gigantic vertical plane as a skyscraper demands. It may be said that architects have had a vertical problem to deal with before, in the Gothic cathedral. That is true, but the conditions are entirely dissimilar, for there was a proportionate breadth at the architect's disposal. Many of the skyscrapers are on plots so narrow in comparison with their height that little remains to be dealt with but a vertical streak, as in the acute angle of the "Flatiron" or Fuller building of New York. Attempts have been made to reduce the apparent height of these buildings by the use of repeated horizontal lines. The result of such treatment is seen in pronounced form in the St. Paul building in New York. Here the designer has grouped two storeys together and piled section on section in monotonous uniformity, until the client's

money-limit was nearly reached, when, as a sublime effort, three storeys are grouped above a sub-cornice and the attempt is finished—a procedure, as one writer puts it, "quite as sensible as if a man were to thrust his head through the crown of his hat and wear it below his head instead of above it."

Various other styles of high office buildings are seen, but few are satisfactory in appearance. The fact is, the problem is really an impossible one with more than a certain number of storeys. There have been, however, some notably successful attempts to secure a satisfactory design, chief among which are the Monadnock building in Chicago, designed by Mr. John W. Root; the Schiller building in Chicago, designed by Mr. Louis H. Sullivan; and the preliminary sketch for the "New York Times" building, by Mr. Cyrus L. W. Eidlitz.

Whether or not the skyscraper will eventually make its appearance in London is a moot point; probably it will not; certainly not to the height of some of the erections in New York; but, to our mind, there can be no doubt that steel framework for buildings will be more and more adopted. We may not like it, but it will be used all the same, for the reason that it enables buildings to be erected so much more quickly; and in the future the proverb that "Time is money" will have a more poignant application even than it has to-day.

Views and Reviews.

A Mechanical Year Book and Diary.

The nineteenth annual issue of this useful little pocket diary has just been published. It is now a well-established favourite with engineers, and provides a large amount of most useful information. It deals with all branches of the subject and even includes useful data on beams and girders and other details that concern structural engineers, architects and others connected with the building industry. In this issue a considerable amount of new matter has been introduced. The steam turbine is dealt with very lucidly in a section of ten pages, written by Mr. R. M. Neilson, a well-known authority. Another section has been included on refrigerating machinery, ice manufacture and cold storage, while a third section deals with speeds and feeds suitable for high-speed steel tools, in which connection a new and extended table of cutting speeds is given. Additions have been made to the section dealing with gas and oil engines, and among other new matter will be found tables of screw threads, strength of crane chains, shaft bearings, weight of bolt heads, and useful recipes.

"The 'Mechanical World' Pocket Diary and Year Book for 1906." Manchester: Emmot & Co., Ltd., "Mechanical World" Offices. London: 118, Chancery Lane, W.C., price 6d. nett.

Steel Arch Bridges.

The subject of bridge design and construction is a very important one, and one in which architects are interested: of course their interest lies more with stone bridges, but we think they have equally a right to deal with the design of steel bridges. It is true at the present time that there are very few architects who are capable of designing a steel bridge or intimately co-operating with an engineer in the design. Indeed there are few that could be trusted to put the trimmings on to an engineer's design—the only direction in which they have up to the present been permitted to have a say. In a few instances on the Continent and in the United States architects have only been called in to design the detail; and in this country the only instance we can call to mind is the new Vauxhall Bridge. Yet engineers are by the very nature of their training incompetent to design a steel bridge with any regard to beauty. We say this not meaning the added decorative detail, but using the word as the effect springing from structural fitness or logical treatment. Engineers engaged on this class of structure are, with few exceptions, wanting in originality and artistic training. The method by which they arrive at any particular design is to add the well-worn elements one by one until the needs are eventually fitted. They are seldom able to eliminate all but the essentials, and thus the detail is a conglomerate of solutions of various small problems. It is only after a considerable practice, and as a result of wide co-operation in the engineering trade, that methods are simplified. The architect's eye, on the other hand, instinctively grasps that the eventual solution arrived at is not a final one because of the inartistic or illogical appearance it has. It is the little details which an engineer is accustomed to accept as inevitable that ruin the effect of any skin of architectural detail that may be applied. Of course in the majority of cases the detail must be of the simplest kind, otherwise the work that each structural member is performing will be obscured, and the added weight will appear at once as a foolish waste of labour and give an intelligent observer a feeling of dislike—that is to say, it will appear ugly.

This book deals more particularly with practice in America, where the designers have progressed very rapidly, having had many

large jobs to undertake. It is well known how the American steel industry has co-operated in design and manufacture, so that in a short time considerable progress has been made towards standardizing steelwork design. This standardization means a final solution of certain problems in practice, and it is the want of this which has rendered the majority of engineering structures (after all the whole of steel design is only of about a century's growth) unsatisfactory from the point of view of architectonic beauty. When there is plenty of work, of course, it does not take long to evolve a logical treatment which shall give satisfaction, because it is experience which is the first essential.

This book is of a very practical nature, and gives details of the most important members of many structures of several types of design in the arch-span bridge, together

with photographs of the completed works. These are very valuable, and should be studied by English architects and English engineers as representing the outcome of much experience. Many of these designs, which are not all American, including a few German and French examples, we think will appeal to everyone who has a slight knowledge of steelwork design as being extremely well fitted to their purpose and having a beauty all their own. Detail would have to be very carefully applied without destroying their beauty, gaunt and naked though it is.

"Details of Bridge Construction," Part I., by Frank W. Skinner, M.Am.S.C.E. New York: McGraw Publishing Co. London: E. & F. N. Spon, Ltd., 125, Strand, W.C., price 12s. 6d. nett.

The Standard Work on Plastering.

We have already dealt with this book in reviewing the first and second editions.

WROUGHT-IRON GARDEN HOUSE AT MELBOURNE HALL, DERBYSHIRE.

This delightful wrought-iron garden house is at the edge of the pool at the bottom of the stately terraced gardens of Melbourne. The little urns and crescents and the small repoussé arabesque mask are gilt. The vertical panels are somewhat distorted by a settling of the stone steps. The work probably dates from the middle of the seventeenth century.

The third edition is now before us. Our readers will recollect that the author, William Millar, died at the beginning of last year when engaged upon the revision of his book for the third edition. All the corrections and additions of which he left any notes have been made in the present issue, while the chapters relating to materials, including fibrous plaster, terra-cotta and concrete have been subjected to careful revision by another hand. Numerous minor alterations and additions have been made in some of the chapters and various diagrams redrawn, but the portions of the book dealing with the history have not been altered, nor the author's excellent descriptions of the practices connected with the crafts, for which the book is especially valuable.

The subject of plastering has many sides to it. There is much matter in the book relating to the artistic side and the history of plastering, and the book is all that can be required in this particular. We have heard a good deal of late from architectural draughtsmen and others who have taken up the craft, while amateurs have certainly improved its artistic treatment, but they have rather overdone the "art and crafty" part of it, and in regard to the practical treatment they have not helped us forward from where the ordinary operative plasterer left us. Mr. Millar's book gives all the practical information that is so valuable, and we could only wish that other crafts connected with the building trade had been as well dealt with. Of course the difficulty is to find a practical man who has the ability to write on the principles intelligibly. The author was a little too enthusiastic in regard to his subject and went outside his province in many respects by elaborating in regard to concrete work. There is plastering done with Portland cement or hydraulic limes, but this is as far as he should have gone. Long descriptions of the manufacture of Portland cement and the use for concrete work is out of place, because it does not concern the plasterer. Therefore we do not welcome the description of reinforced concrete which has been added to the volume, nor the revision of the matter relating to Portland cement. Reinforced concrete is altogether too intricate a subject for the plasterer to deal with. It requires considerable scientific ability, and the treatment in this volume is totally inadequate; in fact, it is almost ludicrous. Some of the writers who have assisted in the revision of the sections of the book dealing with concrete floors and staircases are too closely connected with trade to be recognized as unbiased authorities, and we do not see the taste of including certain forms of construction or specialities with which they are connected and excluding at the same time other specialities with which they are in trade rivalry.

"Plastering, Plain and Decorative," by William Millar. 3rd edition. London: B. T. Batsford, 94, High Holborn, price 18s. nett.

Chains for Hauling and Lifting.

We do not know of any book having been written on chains for hauling and lifting, and this paper is probably the first on the subject. When the Home Office recently prepared a series of draft regulations for docks and wharves much opposition was aroused, and Prof. Henry Adams was called in to give the authorities the benefit of his long practical experience in connection with dock machinery and cranes, with the result that the regulations finally issued were considerably modified and the dock owners relieved from what would have been onerous restrictions upon the carrying out of their work, particularly as regarded the testing of their chains and machinery.

"The Use and Care of Chains for Lifting and Hauling." A paper read before the Civil and Mechanical Engineers' Society by Prof. Henry Adams, M.I.C.E., M.I.M.E. London: Prof. Henry Adams, 60, Queen Victoria Street, price 1s.

Obituary.

Mr. Humphrey Hussey, builder, of Southampton, died recently, aged 65.

Mr. George Wiltshire, a retired builder of Earl's Court, was found dead in bed recently. He was 79 years of age.

Mr. R. B. M. Stewart, of the firm of Messrs. Potier, Stewart & Hardie, building specialists, Glasgow, was seized with illness while in his office on Wednesday last and expired almost immediately.

Mr. John Bowden, architect and surveyor, of Manchester, died on November 16th. He was known chiefly as a surveyor, and in this capacity was largely responsible for the Manchester Jubilee Exhibition of 1887. One of his latest buildings is the warehouse of Messrs. Cooper in Dale Street, Manchester.

Mr. A. W. Mills, architect, of Manchester, died on Wednesday last. He was born in London in 1829, and was articled to Mr. J. B. Bunning, with whom later he was joined in business at Manchester. In 1853, after Mr. Bunning's retirement, Mr. Mills took into partnership Mr. James Murgatroyd. When in July, 1838, designs were invited for proposed additions to the Exchange Room, the first premium was awarded to Mr. Mills, who thus became the architect to the Manchester Exchange, a position which he held till his retirement from active work in his profession in 1882. A further extension of the building was found to be necessary in 1845, and of this work Mr. Mills was also the architect. The building was completed in 1848. In 1866 an Act of Parliament was obtained for the building of a new Royal Exchange, and fifty-three designs were submitted. The two sets which secured the approval of the majority of the directors were found to be those prepared by Mr. A. W. Mills and his partner, the late Mr. Murgatroyd; and they were awarded the first premium of 500 guineas and the second of 200 guineas. The building was opened in two portions—the first in October, 1871, and the second three years later. In addition to the Royal Exchange, Mr. Mills was the architect of the London Road Station, Collier's warehouse in Aytoun Street (since transformed into the Grand Hotel); the Manchester workhouses in New Bridge Street and at Crumpsall, the enlarged grammar school (with its very complete gymnasium), the High School for Girls in Dover Street, Oxford Road, and the headquarters of the Manchester and County Bank, with several of its branches in surrounding towns. Mr. Mills was one of the founders of the Manchester Society of Architects, and was its third president from 1869 to 1871. He was elected an F.R.I.B.A. in 1877.

"An Old Scottish Town."—This was the title of the paper which Mr. James A. Morris, architect, Ayr, read before the Edinburgh Architectural Association last week. After outlining the history of Ayr, he gave particulars of the prominent architectural features of the old town, including the Old Bridge, Adam's Bridge, the Tolbooth, the Old Church, the Wallace Tower, the Church of St. John, and the Citadel. In the course of his remarks regarding the Old Bridge Mr. Morris referred to the question of its preservation. He joined issue with the opinion of Sir William Arrol and Mr. Hall Blyth, who advocated the destruction of the Old Bridge and its rebuilding as far as possible with the old material. Mr. Hall Blyth seemed to think that the identity of the bridge would thereby be preserved, forgetting that if once destroyed the Old Bridge and the bridge of Robert Burns was gone absolutely and irretrievably. Mr. Morris indicated that he approved of the schemes submitted by engineers advocating the preservation of the existing structure.

Competitions.

Luton Secondary School and Technical Institute.—The following ten architects have been selected to compete in this competition:—Messrs. Russell & Cooper (London), Mallows & Grocock (Bedford), Gotch & Saunders (Kettering), Greenaway & Newberry (Westminster), Spalding & Spalding (London), A. Hessel Tiltman (London), Brown & Sons (Luton), Milne & Milne (Bedford), M. Zimmermann (London) and Deacon & Hind (Liverpool).

Perth City Hall.—At a meeting of the Perth Town Council in committee last Wednesday the assessor's awards in the competition for a new or reconstructed City Hall were submitted. There were altogether thirty competitors, and three plans were selected in order of merit for a new hall for premiums of 50, 30 and 20 guineas. There were also three plans selected for reconstruction, the premiums for which were 30, 20 and 10 guineas. The first premium for the erection of a new hall was awarded to Mr. J. Wallace Archér, of Edinburgh; the second to Messrs. Thomson & Robertson, of Brighton; and the third to Messrs. Henry & McLennan, of Edinburgh. The first premium for reconstruction was awarded to Mr. James Sibbald, of Dundee; the second to Messrs. Menart & Jarvie, of Perth; and the third to Messrs. Hall Jones & Cummings, of London. A letter was read from the assessor (Mr. John J. Burnet) in which he practically advised the council to adopt the reconstruction scheme. The designs will be on public exhibition for a fortnight in the Sandeman Library.

MODERN ARCHITECTURE IN SWEDEN.

IN Sweden to-day there is a group of well-educated, far-travelled, brilliant young architects, says a writer in the "American Architect." No country gives its people a better education. When a young man training for architecture has finished his college course, he spends four years in the technical high school under the careful and thorough instruction of Professor Clason, himself a master of design, an art critic and historian. Only about one-half of the applicants are admitted, the examination being competitive. After finishing this course the best students spend three years in the Academy of Fine Arts, devoting themselves entirely to design. In the last year there is a competition for the Royal Medal, which entitles the holder to three years' foreign travel. It seems that, medallists or not, most of the young men manage to spend a year or two in southern Europe, and several have supplemented their home training with some years in American offices. The average number of students in the Academy is only fourteen or fifteen, because the many competitions and examinations have weeded out the weaklings.

The Three Schools.

There are readily noticed three tendencies among the modern architects. First, there is the "eclectic" school, foremost among whom are Clason, Aronson, Johanson and Josephson. These men go where they think the suggestions for the problem in hand are the best—one day Italy, next the Isle de France or England, or maybe Spain.

The "national" school, on the other hand, contends that the only way is to continue the tradition of their own country reverently and intelligently. Hagstrom, Eiljekvist, Wahlman and Lindegren have done good work based on suggestions from the past. Among the motives that have appealed to these men are the strong and bold roof-lines, often gracefully curved and freely broken up with towers and turrets, dormers and chimneys. A characteristic treatment of the roof

THE "TOM TOWER," CHRISTCHURCH COLLEGE, OXFORD. DRAWN BY C. T. ARMSTRONG.

This tower derives its name from "Great Tom," the bell in its upper stage, formerly belonging to Osney Abbey. The entrance gateway was erected to the height of the two smaller towers by Cardinal Wolsey, but the bell tower was added by Wren about 1632.

is seen in the break at about half height, with a foot or two vertical, and often pierced with windows. This motive is an echo of the clearstory. Another suggestion is found in brick walls where a pattern or sunk-panel work has the background plastered to bring out the design. They call this "Baltic." For the interior there are endless suggestions in the ceilings, both panelled and plastered, the wainscoting and doorways of the early Renaissance.

The third group is that of the "individualistics," and it probably includes the most resourceful of the designers, even if some of their work is so new that the shock when first seen is difficult to get over. If they always did as good work as Boberg, Wickman and Lallerstedt, one would have little fault to find.

New Cities and House Design.

Not only the architects, but, what is more to the point, the city fathers, have begun to realize that there are two ways of planning a city, one using the engineer's checker-board, and one where the natural conditions of valleys, hills, rivers, railroads, existing buildings, old roadways and other circumstances influence the final appearance. Several new cities have been planned *de novo* by the architect Hallman, and at least two cities, Gothenburg and Helsingborg, have instituted competitions for the best scheme for future extension of their limits.

The newer villa architecture is quite notable. Somehow the Swedes have learned—even the carpenter-builders know how—to place suburban, seaside or mountain residences so as to nestle down snugly among the surroundings. The original clump of pines, firs or birches is preserved as much as

possible, and just enough of the house, with its flag-pole, is seen as to excite the curiosity of outsiders, and yet give the dwellers a view to the outer world.

Scholander.

It is quite impossible to ignore the name of F. W. Scholander. He was really the founder of the present movement for better things in architecture. By nature a poet, and by nature and training an architect and painter and a man of strong personality, it was inevitable that his influence as professor of architecture for a generation should be great. Nearly all of the older architects were guided in their early years by him.

A worthy successor was found in Professor Clason. A man of great energy, a designer of rare taste, highly eclectic and refined, and often original, he stands easily a leader in the profession. Time and again he is called in as an assessor in competitions, while as a forceful, elegant and epigrammatic writer and historian he stands in every way for that which is best and highest in his profession.

Stone and Brick now used in place of Stucco.

There was a time when the use of real brick and stone for the face of a building

was unknown in Sweden. It was the era of the pseudo-classic, when nothing would "go" except the "orders" and an accompanying cut-and-dried system of details, invariably executed in stucco. A few years ago, however, Professor Clason, then quite young, made a bold effort to break away, and introduced real stone in some apartment-houses. It is worth noting that he found, when looking for suitable material, just one quarry in a country with limitless supplies of the finest kind of granite, sandstone and limestone. To-day all that has changed and new buildings of any note, at least public structures, are always of native stone or brick.

Curiously enough, stucco has really lost nothing. In place of being used for senseless imitations of Italian forms, this material has now come to its own, when handled by masters of design. They use it in broad masses, sometimes coloured as a background to set off the grouped windows. Recognising its plastic qualities, they concentrate their ornament and use flowing forms that are in harmony with the natural manner of working in this material. Sgraffito is also used, notably in friezes, where good effects are obtained by scratching patterns through a light top-coat to a dark coat beneath.

Regulations.

Although there is no licensing of architects, building is very thorough. A general law obtains throughout the whole country. Local conditions are provided for by supplementary regulations enacted by each city. As an instance of the strictness of the laws, it may be noted that no wooden stairways are permitted inside city limits. Stairs are usually of stone or concrete, and are carried by brick walls; and there is no skimping in the use of brick walls, as they are considered the best of fire-retardants.

As labour is cheap, machine-made stuff is rare—in fact, standard designs of pews, pulpits, mantels, &c., are nearly unknown. The result is that architects can afford, even in quite ordinary work, to indulge in "special design."

IFFLEY CHURCH, OXON., FROM THE SOUTH-EAST.
DRAWN BY C. T. ARMSTRONG.

HOUSE AT CROYDON. WILLIAM F. HARBER, ARCHITECT.

This house has been built of stock bricks, rendered externally with cement rough-cast and pebble-dashed—mixed before application with copperas to dry a light biscuit tint. Portions of the interior are panelled in pine painted a light stone colour. The architect was Mr. W. F. Harber, of Chelsea. The drawing reproduced above was exhibited at the Academy this year.

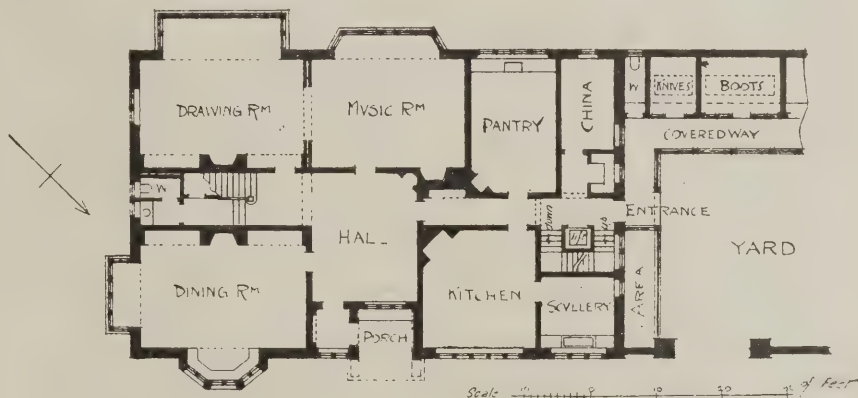

Correspondence.

Foreign Fireproof Floors.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Your correspondent "A. C. F.," in upholding the prerogative of architects to specify whatever goods they please, whether foreign or British, has fallen into several errors, doubtless from not having clearly understood the purport of the comments made in many of the letters which have lately appeared in numerous organs of the press. So far as I have gathered from reading the correspondence referred to, the complaint has been that foreign-made goods, to the exclusion of British-made goods, have been and are now being specified by the "Barrack Construction Branch" of the War Department and by the architects of buildings being erected on Crown lands, &c., regardless of the facts (as alleged) that numerous firms in London alone produce goods of equal or better quality at lower prices. These allegations are not mine, but, so far as I have yet seen, nobody has traversed them. Certainly "A. C. F." makes no attempt to do so. His championship of architects is a mixture of boldness and feebleness, if I may be permitted to say so without offence. The boldness is in his claim that architects and their specifications are above and beyond the criticism of the lower mortals. His feebleness is in the unconscious drollery of his plea that the Italian-made partitions are "fixed by English labourers." I wonder he did not add that the mortar or cement used by these few highly privileged Englishmen is actually mixed with English water!

So far as I understand the recent correspondence, the questions to be answered by "A. C. F." and those who take up a similar position are—(1) Is an architect justified under existing conditions in specifying foreign-made goods, which are admittedly dearer and not proved to be better than kindred articles made by numerous firms in this country? (2) Is it correct for an architect to specify a certain foreign-made article by name, without adding the customary

words "or other approved make," thus making it compulsory on the contractors to obey, when such architect has closed his eyes and ears to the British makers of kindred articles who would have been only too grateful to be even permitted to quote?

I may say that I am not one of those imaginary "British working men" whom "A. C. F." erroneously supposes to have been criticizing his profession. As a matter of fact, I have not observed that a single individual of the working class has intervened so far in this correspondence. For my part I look at the matter as a taxpayer and ratepayer. As a taxpayer I object to public moneys being spent abroad; and as a ratepayer I demur to the still further increase of rates, which must inevitably accrue from Government departments, for unexplained reasons, persisting in increasing the number of our unemployed at home by placing their orders in foreign countries.—Yours truly,
OBSERVER.

Office Towers.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Your leader on "Office Towers" has excited greater interest than possibly even you surmise. The ideal site for a first attempt is now open, namely, between the Hotel Cecil

and Villiers Street, facing the public gardens and the Embankment—a most central position and now for sale—where the office tower would not overshadow other property to any extent, and if artistically erected (say, after the style of St. Mark's Campanile, Venice) could hardly meet with the opposition of the L.C.C.—Yours truly,
A READER.

Mr. Dawber's "At Home."

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Allow me a space in your journal to call the attention of readers who are members of the Architectural Association to the "At Home" which I am giving on the evening of December 8th, at 8.30, at No. 18, Tufton Street, Westminster. I am very desirous of welcoming as many members as possible who may not perhaps have seen our new premises, and who would like to take this opportunity of meeting old friends and students and members of to-day. There will be an exhibition of holiday sketches and photographs, &c., and I hope the evening may result in the furtherance of that spirit of good-fellowship which it has always been the aim of the Architectural Association to foster.—Yours truly,
E. GUY DAWBER, President.

Law Cases.

New Houses : Occupancy before Certificate for Drains and Water granted.—At the Bristol Police Court recently a local builder was summoned for allowing three new houses to be occupied before the drainage was completed, and also for allowing the houses to be occupied before being certified to be in every respect conformable to the by-laws. The bench imposed a fine of 10s. and costs in respect of each house.—Mr. A. H. Clough, of Ringwood, was recently summoned by the Salisbury Rural District Council, for permitting a certain dwelling-house built by him at West Winterslow to be inhabited without first having obtained from the local authority a certificate that there was within a reasonable distance an available supply of wholesome water. Mr. Clough pleaded not guilty, and stated that he applied for a certificate and failed to get it in four months. Mr. Trethowan, for the council, said it was quite true that the defendant did apply for a certificate, but he applied when there was really no water-supply. Mr. D. W. Morrice, inspector of nuisances to the council, said that the house was occupied on September 20th, whereas there was no certificate granted until October 27th. Mr. Clough in the course of his defence said he arranged to supply the cottage from a well 130 yds. distant, and he asked the council to sanction this proposal pending his being able to carry out a scheme which he had in contemplation respecting other cottages at Winterslow. An ample supply of water was laid on by a pipe from the well. Between August 4th and September he laid on the pipe, and at the end of the latter month he received a letter from the council declaring that the pipe was not protected. He wrote replying that that was not a reasonable objection, and at the end of October they granted him the certificate. Mr. Trethowan said that he wished to point out that when Mr. Clough made his application for a water certificate there was absolutely no water-supply to the house at all. Then from time to time certain alterations were made. As soon as everything was put right the inspector came and asked the council to grant the certificate. There was no delay on their part at all. Mr. Clough persisted that there was delay, and added that he was still rather in the dark as to what constituted a reasonable distance in regard to this matter of water-supply. The magistrates fined him 10s. and costs 9s.

A Bradford Architect and his Pupil.—On November 20th at the Bradford County Court his Honour Judge Bompas, K.C., gave judgment in the case in which James Edgar Adamson, a minor, sued through his father, Mr. J. J. Adamson, architect, of Hull, to recover damages for breach of indenture of apprenticeship from Mr. H. E. Priestley, architect, of Bradford (see p. 271 of our issue for November 8th). The plaintiff had said that his son was not making satisfactory progress in the defendant's office. The defendant in reply had stated that the plaintiff was disobedient and did considerable damage to the office property, and defendant refused to take him back after he had left on one occasion to consult his father. His Honour, in giving judgment, said the action was brought under the articles of apprenticeship against the defendant for not instructing the plaintiff according to agreement. It had been held that if one made it impossible for the teacher to fulfil his contract one could not sue him for not doing so. The first question he had to decide was whether or not the conduct of the plaintiff was such as to make it impossible to teach him. He found this was not the case, but the plaintiff seemed to have been a very disagreeable pupil. Considering the question of damages,

he thought it reasonable that they should be a proportionate part of what was paid for the apprenticeship, and he fixed the amount at £18 7s. 6d. With regard to defendant's counter-claim of £50, it was clear that he could not allow a counter-claim against an infant for the breach of his contract to be a good apprentice. That was an action which lay, if at all, against his father. It was said that in certain circumstances an infant could be sued for tort. No doubt it was a tort if you took up a great piece of iron and hit it upon the floor to annoy your mistress, but it seemed the natural misconduct of a youth who was a somewhat lively apprentice and did not get on well with his master and mistress, and it was not such as would render an infant liable. He therefore declined to allow the counter-claim. His Honour went on to say that in making these remarks he did not wish to encourage the defendant to bring an action against the plaintiff's father. He knew there was a strong inclination when one failed in an action to bring an action against another person, but that was not a very Christian spirit. Moreover, he thought it was the class of case which, if the father were sued, would be very expensive, and there would be the risk of failure after all. Quarrels were not good things in this world, and he suggested to the defendant whether he had not better "grin and bear it." Mr. Harold Newell, who represented the defendant, said his Honour would remember that the plaintiff made certain suggestions as to the defendant's practice and consequent inability of the plaintiff to get instruction in the defendant's office. The defendant adduced a good deal of evidence to rebut this accusation, and might have given more but for the fact that his Honour expressed himself as perfectly satisfied that the defendant had a good, reputable and extensive practice. Unfortunately, that remark of his Honour's was not published, and he would like the judge to make some deliverance on the point, because the impression that had got abroad tended to do his client considerable harm. His Honour: "I formed the opinion that there was nothing in the defendant's practice that prevented his being thoroughly competent to teach an apprentice." On application by Mr. Newell, his Honour gave leave to appeal on condition that £30 was brought into court.

The Height of Kitchens.—At Oldbury last week a builder named Wills, of King's Heath, Birmingham, was fined 20s. and costs for providing kitchens only 8ft. 2ins. high, instead of 9ft. as required by the by-laws, in some houses which he was erecting in Park Road, Warley.

Light and Air Case.—On November 21st at the Plymouth County Court his Honour Judge Lush-Wilson gave judgment in an action brought by Mrs. Ellen Hamlyn, as owner of 15, King Street, Devonport, against Mr. E. M. Leest, architect, of Devonport, for damages caused by the erection of a wall 28ft. 2ins. high, which, it was alleged, had materially diminished the light and air to the house. In giving judgment, after a very lengthy hearing, his Honour said he was not going to find a verdict for the plaintiff in the matter of the air question, as he was satisfied that the air had not been materially diminished so as to cause inconvenience to the plaintiff. But with regard to the matter of light there was no doubt that the value of the plaintiff's premises had been materially affected by the erection of the wall, which must have obstructed some light, and there was no doubt that many persons who wanted light rooms to live in would not become tenants of the premises. There had also been a trespass on the plaintiff's premises with scaffolding used in the erection of the wall. Verdict for plaintiff for £80.

OUR PLATES.

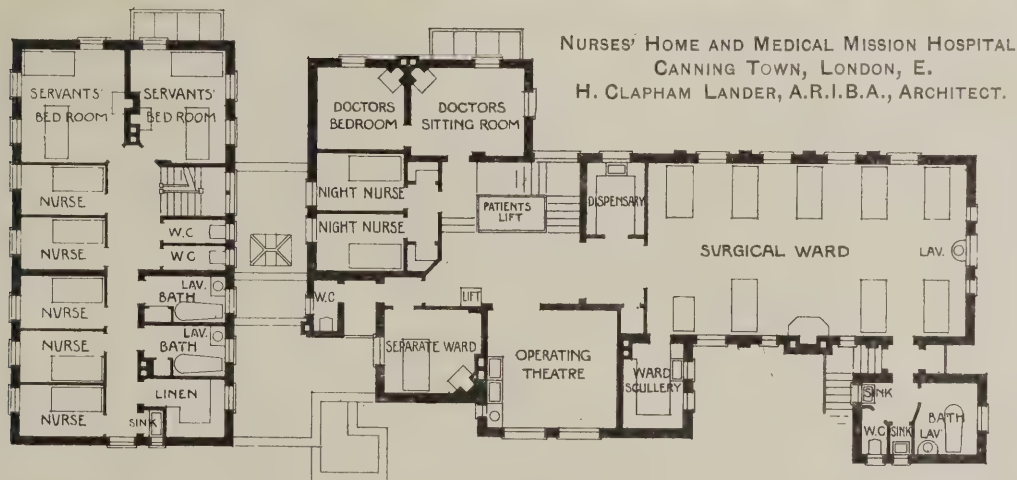

THE house at Tidenham, Gloucs, is built of local limestone, the upper part being weather-boarded with elm, which, when toned down by exposure, harmonizes so well with the silver-grey and delicate greens, yellows and pinks of the Gloucestershire stone. The site has a commanding view of the Bristol Channel, almost from Gloucester to the Somersetshire coast, with a view of the Wyndcliff overlooking Tintern Abbey behind. The approach is along a natural avenue of trees, from which the house was set out, terminating in a square courtyard with the house forming two sides and with a yew hedge on the other two sides. The house, with its long slope of roof, was designed to compose with and carry out the slope of the field in front. The terrace is paved with old paving stones, with box-edged beds and a small sunk garden in front of the dining-room. This latter is panelled, with an oak dresser designed on old-fashioned lines, let into a recess and kept flush. The architect of the house is Mr. Norman Evill, of 124, Regent Street, London, W. The drawing reproduced was exhibited at this year's Academy.

The medical mission hospital at Canning Town has been erected for the committee of the Settlement for Women Workers. It is built to accommodate women and children only, and is divisible into two parts, the hospital and the nurses' home. The former has been given by the generosity of Messrs. W. H. Brown and J. R. Roberts, both of Woodford, and the home has been built by subscription. The home is for nurses engaged upon district work as well as for those employed in the hospital. The outpatients' department is at Old Canning Town. There is no provision for such cases in this building, nor for accidents. The nurses' home faces Balaam Street, and the hospital is placed towards the rear of the site and near its northern boundary, so as to give space for a large garden on the south side. The accommodation in the nurses' block comprises nurses' dining- and sitting-rooms, home sisters' room, nurses' and servants' bedrooms, with bath and linen rooms, &c., as well as attics. Between the home and the hospital are the main kitchen and scullery, as these will be used in connection with both departments. The hospital block on the ground floor consists of a medical ward with eleven beds, sanitary annexe, ward scullery and verandah facing south, as well as rooms for matron and assistant doctor. On the first floor the hospital is detached from the home and contains a surgical ward with nine beds and sanitary accommodation and ward scullery (as on the floor below), a single-bed ward for patients needing quiet, an operating theatre, rooms for doctor and night nurses, and dispensary. At the rear of the site is a laundry block (not shown on the plan) consisting of washhouse, drying and ironing rooms, with rooms for caretaker over and a mortuary and post-mortem room. The foundation-stone was laid by Mrs. W. H. Brown on November 3rd, 1904, and the buildings were opened by the Countess of Aberdeen on October 19th last. The architect was Mr. H. Clapham Lander, A.R.I.B.A., of Effingham House, Arundel Street, W.C., and the general contractors were Messrs. Gregar & Son, of Stratford. The amount of the contract for the whole of the premises, including laundry block, was £7,788. The average cubic space allowed per bed is 1,123ft., and the cost of hospital (excluding home and laundry) per bed, £231. The perspective of the nurses' home was exhibited at this year's Academy.

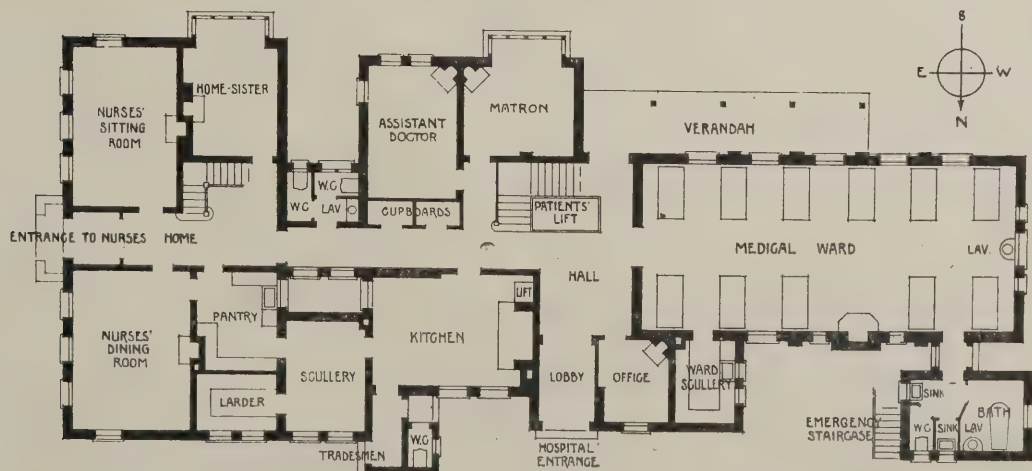

Mr. Brock's Bronze Statue of Millais in front of the Tate Gallery was unveiled on Wednesday last.

OF THE
UNIVERSITY OF ILLINOIS

A TRIPLE-WEB GIRDER.

ON this page we reproduce the shop drawing of one of the heavy triple-web box girders at the second-floor level of the Ritz Hotel, now nearing completion in Piccadilly, London. This girder carries the exterior wall and eccentric load from a column on the centre of the span. The box girder type was adopted because the load on the girder was not applied centrally with the girder, the width of the flanges being depended upon in calculating the resistance against twisting.

The loads are transferred from the flanges to the web-plate by means of angles and reinforcing plates, milled to butt against the upper flange of the girder and against the lower flange, as well as at supports.

The floor beams are connected to the girder by means of side connection-angles, and rest on seat-angles and stiffeners. The weight of one of these girders is about 18 tons.

NORTHERN ARCHITECTURAL ASSOCIATION.
President's Address.

THE Northern Architectural Association held the opening meeting of the session on Wednesday last at Newcastle.

The president (Mr. J. T. Cackett) in his inaugural address dealt at considerable length with the planning of Newcastle, reviewing the public improvements which have been made since 1840, when Richard Grainger, under the guidance of Mr. Dobson (past-president of the Association), had practically completed his reconstruction of the town. Mr. Cackett said he was forced to the conclusion that at present they were as much behind the times as their predecessors were in advance of their day. The improvements effected since 1840 were, of course, considerable, but he questioned whether they did anything more than provide for the bare necessities of the time. There could be no doubt that Newcastle from 1840 to 1860—before

the Abominable Practice

of obliterating a façade with enormous gilt letters and illuminated devices became the fashion—could compare most favourably with any city in Great Britain for fine streets, and was far ahead of any other town of its size. But could they point to a proportionate increase of streets of the quality and grace of those of 1840—in spite of the great development of education and artistic training? Unless they had thoroughfares roofed wide at least, capable of accommodating four rows of trams, it was hopeless, with the street surface only, to satisfactorily conduct the through traffic and stopping traffic on one thoroughfare; and since in the centre of the town they could not now hope to widen the streets throughout (although opportunities for this had in very recent years been missed) the remedy appeared to be to create new streets. One of the most desirable improvements would be to add to the usefulness of Percy Street—and thus relieve Grainger Street—by either improving the approach to it or making a new street to the north of Clayton Street. A street from the Monument to the Haymarket he also thought desirable, and he trusted the building of a free high-level bridge across the Tyne would not be long postponed.

The Latest Improvement

undertaken by the Council—the Market Street extension—would if properly carried out prove one of the greatest boons to the city since the days of Grainger; for it duplicated New Bridge Street, and so might relieve it of

the great amount of through traffic which so congested it now. But when they looked at the details of the scheme it seemed to leave much to be desired; and, in his opinion, it was a striking example of shortsightedness. For the ample provision of light and air, and certainly for aesthetic reasons, it was desirable that the height of buildings should be less rather than exceeding the width of the street; and when they considered this in conjunction with the increasing traffic, it seemed a serious mistake that this main thoroughfare should be only 60ft. wide. His criticism of the Market Street extension had tempted him to consider whether, by dealing with the matter as Grainger and Dobson certainly would have done, there was not room for a magnificent improvement to this part of the town, which would also be financially successful. The great expense of the scheme lay in the purchase of all the property between New Bridge Street and New Market Street and the old property to the south of New Market Street. With one or two unimportant exceptions, all the property in this area was old, and there were schemes for rebuilding a very considerable portion of it. Were this property bought up and the area laid out as he had planned, they would have blocks commensurate with modern requirements and with frontages which would command prices that would go far to pay for the scheme, even if it did not do more.

Builders' Notes.

Alderman Charles Carter, J.P., the new mayor of Poole, is the head of the well-known firm of Carter & Co., architectural ceramic and tile makers, Poole.

A Lady Builder is about to commence the erection of cottages at Letchworth (Garden City). The cottages are to be built under her sole supervision and control.

Mr. James Bromage, builder and contractor, Worcester, has been appointed sheriff of the city, and Mr. A. H. Constance, builders' merchant, the city chamberlain. Another builder and contractor, Mr. J. Sharman Wood, who is an ex-mayor of Worcester, is chairman of the Worcester Licensing Committee.

A Manchester Contract.—The contract for the extension of the London Road Station, Manchester, and the widening of the line to Ardwick, has been secured by Messrs. R. Neill & Sons, the amount mentioned being £150,000. The necessary demolition of property was completed some time ago, so that the excavations can commence at once. Some welcome work will be found for unskilled labour.

A Progressive Staffordshire Brick Firm.—At a time when one hears so much of decaying industries, especially in the Staffordshire brick trade, it is satisfactory to record an instance of progress such as the rejuvenation of the old-established blue and red brick and tile works of Messrs. W. E. Partridge & Co., at Kingswinford, Staffs, which was celebrated by the starting of the fine new engine and brickmaking machine that have been put down. Messrs. Partridge & Co. have had a long run as brick and tile manufacturers. The firm dates back far into last century, when the Kingswinford district was at its zenith as a brick and tile district. The products reached a high place in repute, but the old firm, content with their record, neglected to keep pace with the times. Now, however, the order of things has changed, and since the works have passed into the hands of Mr. J. E. Chambers they have been brought up-to-date. The brick machine is upon the wire-cutting principle, and will produce 15,000 bricks a day. It has been put down by Messrs. Parsons, Ltd., of Brierley Hill.

Masons object to Adamant Paving.—A deputation of operative masons at Aberdeen waited on Lord Provost Lyon last week to protest against the proposal to lay adamant pavement in Union Street. Both as regards economy and durability they thought the pavement ought to be relaid with granite.

A List of Plumbers.—One of the waterworks regulations in force in Leeds provides that anyone may employ a competent plumber to do work in connection with the internal distribution of water, "but the Corporation reserve to themselves the right of objecting to the employment of any plumber who may have wilfully infringed these regulations." In order to exercise this right the Waterworks Committee have decided to have compiled a list of plumbers in the city, and those who may have wilfully infringed the regulations for preventing waste and misuse of water will be struck off the list.

Wages in the American Building Trade: Strikes Threatened.—In the American building trade strikes of a disastrous character seem to be imminent unless wages are advanced. At present for an eight-hours' day bricklayers receive 22s. 6d., tilelayers 20s., sheet-iron workers, carpenters and house-smiths 18s., and painters 16s. per day, and double pay in each case for overtime. With the exception of the bricklayers, all the trades enumerated now demand an extra 2s. per day. It is quite on the cards that the employers, with a desire for the "open shop" system, may soon risk another fight with the unions, which so far have proved themselves masters of the situation.

Incorporated British Institute of Certified Carpenters.—The fifteenth annual report will be presented to the annual meeting to be held on Saturday next, December 2nd, at Carpenters' Hall. This states the Institute to be in a flourishing condition, with an encouraging outlook. During the past year twenty-eight new members have been elected, the total membership now standing at 181. For the first time a booklet containing a list of members' names and addresses has been issued this year. The council desire to inform provincial members who are unable to attend meetings that they will be pleased to receive papers from them, and that provision will be made for the reading of these papers.

Messrs. Minton, Hollins & Co., of Stoke-on-Trent, announce that in actions heard at Edinburgh in June last against Messrs. Cochran & Fleming, pottery and tile manufacturers, Glasgow, Messrs. Alexander Wilson & Co., tile layers and tile contractors, Glasgow, and Messrs. Cherry & Co., Ltd., tile layers and marble contractors, Glasgow, decrees were granted prohibiting the above-mentioned firms from manufacturing, selling or using tiles having the words "Minton, Hollins & Co., Patent Tile Works, Stoke-on-Trent," or any part of these words or combination of letters calculated to deceive the public into the belief that such tiles were made by Messrs. Minton, Hollins & Co.

Hydraulic Power for London.—The Metropolitan Water Board have decided that the restrictions which have hitherto prevented an extended use of the London Hydraulic Power Company's supply of high-pressure water for fire extinction is to be withdrawn, and in future it will be possible for anyone to have hydraulic pressure apparatus fitted subject to the domestic water used being passed through a meter. The injector hydrant combines in one jet the force and volume of both the hydraulic power and domestic supplies. In some districts in London served by the Hydraulic Power Co., under the regime of the old water companies injector hydrants have been in use for many years, but in the City and in other important districts it has been hitherto impossible to connect them directly to the water mains.

The South Staffordshire Smallpox Hospital, at Moxley, will be opened on Monday next, December 4th. It provides accommodation for forty patients and for a sufficient staff of nurses and officials to look after a larger number of patients should an epidemic arise. The hospital itself consists of three pavilions, two of which will accommodate sixteen patients each, and the third, an observation block for doubtful cases, eight patients. The floors are of teak, and the walls cement faced. The cost of the work, including the site, will be about £18,000.

Wallpaper Manufacturers, Ltd.—The directors' report for the year ending August 31st last, to be brought before the general meeting to-morrow, shows a profit of £243,227, to which must be added £115,514 brought forward from last year's account. After payment of interest on debenture stock, interim dividend on preference shares, and income tax, there remains the sum of £290,727 for further appropriation. This the directors propose to deal with as follows:—£24,986 final dividend on preference shares at 5 per cent., £87,356 to pay a dividend at the rate of 8 per cent. on the ordinary shares, £50,000 to be carried to the reserve fund, and £128,385 to be carried forward. The company has purchased as from January 1st last the Lin-crusta business of Messrs. Frederick Walton & Co., Ltd. In accordance with the articles of association, five of the directors retire by rotation, namely:—Messrs. A. W. Huntington, G. Kirby, G. W. Osborn, H. W. Sanderson and J. Walker, who, being eligible, offer themselves for re-election. The capital of the company is £3,200,000.

The Plumbers' Company.—At the recent annual banquet the Master of the Worshipful Company of Plumbers (Mr. W. D. Carøe, F.R.I.B.A.) said the objects of the Company were to promote the better training of the coming generations of plumbers by a proper system of apprenticeship, combined with technical education, suited to the modern conditions of labour, and to maintain a high standard of plumbers' workmanship, and thus place the trade in its right position to secure the confidence of architects and authorities acting on behalf of the public. In these objects the Company had the hearty co-operation of the working plumbers in the United Operative Plumbers Association.—At a conference of the committee of representatives of district councils acting in conjunction with the Worshipful Company of Plumbers for the national registration of plumbers, held recently at the Guildhall, resolutions were adopted declaring that no applications for registration upon the submission of proofs of qualification would be received after December 31st, and approving generally the principle of apprenticeship and the keeping of a register of apprentices. Mr. W. R. E. Coles, secretary to the Company, submitted a report upon the negotiations which have been in progress between the Board of Education and representatives of the Lancashire County Council, the Master and Operative Plumbers' Associations, and the Plumbers' Company for the unification of examinations for the purposes of registration. A question had arisen in respect to the City and Guilds of London Institute. The Institute were quite willing to conduct examinations in plumberwork and to give the Plumbers' Company a voice in the appointment of the examiners, but they insisted that they should issue the certificates, and that then, if the holders of them desired to do so, they could send them to the Plumbers' Company to be countersigned. A resolution was passed expressing the opinion that no certificate would be satisfactory unless, before issue, the same was signed by the Company.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Determining Safe Load on Rolled Joists.

BRADFORD.—CANTILEVER writes: "A rolled steel joist 40ft. long, 10ins. deep, 5ins. wide, and 1/2in. thick throughout is continuous over three supports, forming two spans of 20ft. each. What uniformly distributed load would produce a maximum stress of 5 1/2 tons per square inch? Sketch the diagrams of bending moments and shearing force. Please also explain what is meant by the radius of gyration, and give an example of its use."

Draw the linear elevation, Fig. 1, and indicate the loading. The bending moment diagram will then be as Fig. 2. The maximum bending moment will be over the central support = $\frac{wl^2}{8}$; then Effort = Resistance,

bending moment M = moment of resistance R; R = modulus of section z by modulus of rupture c, so that $\frac{wl^2}{8} = zc$;

$\therefore w = \frac{8zc}{l^2}$. Now $z = \frac{5 \times 10^3 - 9^3(5 - \frac{1}{2})}{6 \times 10}$

$= \frac{5000 - 3280}{60} = 28.6$, $c = 5 \frac{1}{2}$ tons per square

inch, $l = 20 \times 12 = 240$ ins., therefore $w = \frac{8zc}{l^2} = \frac{8 \times 28.6 \times 5.5}{240 \times 240}$ = .022 tons per inch

run, or multiplying by 12 = .264 tons per foot run, uniformly distributed load, or for 20ft. span a distributed load of 5.28 tons. Dorman, Long & Co.'s *G 10A 10 by 5 by 29lb., which is the nearest section, at 6.4 tons per square inch will carry over the same span a load of 7.5 tons, practically proving the above calculations. The radius of gyration can be best explained by reference to mechanics. If a thin lamina of the cross-section be rotated about one edge, the radius of gyration is the distance from that edge to the point at which, if the whole mass were collected, the accumulated work per revolution would remain the same. It is a measure of the leverage of resistance of any section, as in the case of a strut, where the whole resistance is made up of the strength of the material, the area of the cross-section, and the disposition of that area with regard to the edge round which bending takes place. The radius of gyration measures the effect of the area and the way it is arranged. The square of the radius of gyration is the moment of inertia divided by the area, or

$r^2 = \frac{I}{A}$, whence $r = \sqrt{\frac{I}{A}}$. Rankine's modification of Gordon's formula uses the radius of

DETERMINING SAFE LOAD ON ROLLED JOISTS.

gyration instead of the least diameter in the calculation of struts, with the requisite modification of the constants, as the calculations are then found to be more in accord with the result of experiments.

HENRY ADAMS.

A Small Baptistry.

CRIEFF.—SUBSCRIBER writes: "I have prepared plans for a small hall which extends over several shops and an entrance, and am now requested to provide for a baptismal tank at the platform for occasional baptisms. What would you suggest as the best way of doing this? I send sketch-plan showing the position of the platform, which is situated immediately over the entrance already referred to. I suppose the tank must be placed in the platform? What should be the size? Should there be steps down into the tank? Would a concrete tank lined with tiles, and set on steel beams flush with the platform floor, do? What depth of water should be in the tank? Should the water be heated, and how? The platform will be about 2ft. above the hall floor."

A section should have been given showing the height of the platform and the walls below, also a plan showing the construction of the floor. The cheapest arrangement would probably be a zinc-lined wooden tank, carried on rolled joists, and enamelled white inside. The length may be, say, 9ft., the width 5ft., the depth 2ft. 6ins., and the depth of water 1ft. 6ins. Steps down one corner. Fig. 1 shows plan with assumed arrangement of floor joists; Fig. 2 cross-section showing movable platform in position by dotted lines. Fig. 3 shows horizontal section with position of rolled joists and ceiling joists over passage. Fig. 4 shows cross-section of platform which may be made portable by having the flooring in, say, two

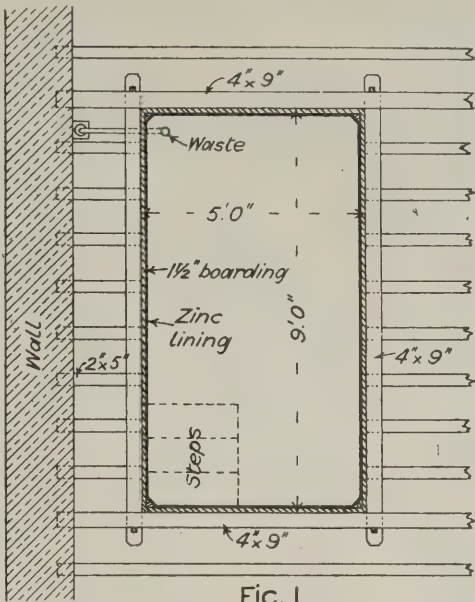

FIG. 1

FIG. 2

FIG. 4

FIG. 3

A SMALL BAPTISTRY.

pieces and the framework in another piece: or a far better arrangement would be to cut it through the centre and have each half running outwards on small wheels and flush rails, but this would mean the removal of some seating accommodation. It is not usual to have heating arrangements, but a geyser could be fitted. The water-supply and waste can be arranged on the spot.

HENRY ADAMS.

Indentures.

GOOLE.—A. B. C. writes: "What are the usual conditions contained in the articles of indenture for a pupil aged sixteen years entering the office of an architect and surveyor in a small provincial town? I want to know the usual period, amount of premium, &c."

The period of service varies from three to five years, but is more generally three years where a pupil can attend a good training centre. Failing this, four or five years would be advisable. Two forms of indenture approved by the Royal Institute of British Architects are published, one for the payment of the premium in one sum and the other for payment in instalments. These can be obtained from the offices of the Institute at 9, Conduit Street, Regent Street, London, W., price 1s.

Walls of Adjoining Owners.

LONDON.—LUNA writes: "I am about to utilize a site which lies between two houses. I take it that the walls of the adjoining owners are external walls. Can I build the walls of my house against those of my neighbours, and in so doing shall I be compelled, in compliance with the London Building Act, to serve notices on the adjoining owners before the work is commenced?"

If you propose to build entirely upon your own land, and do not intend to claim to use

either of the adjacent walls as "party-walls," there is no need to serve any notices upon your neighbours. Of course your plans must be deposited with the local authority for approval in accordance with the by-laws.

F. S. I.

The T-Square Club.

LONDON.—R. N. writes: "Is this club still in existence? If so, please give name and address of secretary."

We understand the club has ceased to exist for about a year now.

Openings for Architects in Canada.

SHEPPERTON.—S. H. writes: "Are there any vacancies for architects' draughtsmen in Canada? Where could I get full information? Could you give me the address of the best Canadian paper to advertise my want in?"

So far as we are informed Canada offers no special opportunities to architects' assistants. But we suggest that you apply to the Emigrants' Information Office, Broadway, Westminster, and to the Canadian Government offices in Victoria Street, S.W. The best Canadian paper to advertise in is "The Canadian Architect and Builder," published monthly by the C. H. Mortimer Publishing Co., Ltd., Confederation Life Building, Toronto, Canada.

Flooring for Cottages.

MANCHESTER.—F. J. A. writes: "(1) In the book of plans, &c., of Garden City cottages a material called 'Stonwod' is mentioned in several places. It is evidently laid on concrete to do away with wood floors and their possibilities of dry-rot. I am thinking of building some cottages, and would like to do without wood floors if I can find a substitute—the tenants do not like concrete, it is too cold. 'Stonwod' claims to be as warm and quiet as wood. I shall be glad to hear anyone's experience of it. Where can I obtain particulars of either this or any other device in lieu of wooden floors? (2) In your issue for November 1st is a sketch of a kitchen range set in a semi circular arch of salt-glazed bricks, doing away with iron pilasters, &c. Is this a special range? I assume it is, as an ordinary range has a flat top and is recessed behind the pilasters."

(1) "Stonwod" is warmer than concrete, quiet, and would do admirably for the ground floors of cottages. For particulars apply to the Stonwod Fireproof Flooring Co., Ltd., 109, Victoria Street, Westminster. A very similar material is "Eubœolith," supplied by Mr. J. Percy Day, 3, Victoria Street, Westminster. (2) The range to which you refer is in the cottage designed by Mr. Percy B. Houfton. It is a special one, without back plates, and was made by Mr. A. Green, stove grate manufacturer, Whittington Moor, near Chesterfield. The lining behind the fire is in firebrick. Pressed or glazed bricks may be used on each side of the firebrick centre-piece, taking the place of the usual cast-iron plates.

Leaded Lights.

STREATHAM.—C. W. T. writes: "What do the London County Council mean by glass in city buildings 'to be fireproof'? Does this necessarily mean that only 'Luxfer glazing,' made by the British Luxfer Prism Syndicate, Ltd., must be used? I wish to know if leaded lights can be employed in any way."

Leaded lights are very far from fire-resisting. What is referred to is "Luxfer glazing" or wired glass.

Whitening Cement-concrete; Timber Sizes.

HARROW.—A. R. B. writes: "(1) Can you suggest any method of whitening, or making so as to weather white, or altering the colour of, cement-concrete steps, copings, &c., other than: with Portland stone chippings? Do

you think that the addition of whitening or chalk would have any effect? (2) In what book can I find the stock sizes of timbers, &c.?"

(1) White spar would be a better aggregate than Portland stone chippings as regards whiteness, but it is not necessary to make the whole of the steps throughout with a special aggregate: the core may be made with an ordinary aggregate such as furnace ashes, and a fine facing cast on to it, this being done by putting the facing material into the mould first and then shovelling in the rougher material. For the facing silver sand might be used, but this would not be advisable alone as giving shortness which would cause steps to wear away with the traffic, but it might be used with white spar. A whitish cement should be carefully chosen, and a very small amount of whitening would add whiteness and not cause harm. Another method would be to go in for a white terrazzo face made by putting white marble chippings or white spar into the mould first before pouring in the concrete, afterwards rubbing down the face to bring out the white material and polish it. Such work is done by several concrete firms such as Messrs. B. Ward & Co., Ltd., of Grosvenor Works, Bedford; Messrs. W. B. Wilkinson, of 13, St. Mary's Place, Newcastle-on-Tyne, and Messrs. Hodkin & Jones, Ltd., of Havelock Bridge, Queen's Road, Sheffield. (2) There are no hard and fast sizes, though some are in more general use than others. These can be ascertained from "Specification" and other books on construction, timber trade periodicals and also our list of "Current Market Prices."

Shop Fronts.

PLYMOUTH.—A. W. P. writes: "(1) In Mitchell's 'Advanced Building Construction' the author says that in a street more than 30ft. wide any shop front may project 10ins., and no more, over the boundary line. Does this apply to the fascia and sill-piece, &c., or to the pilasters at either end? Mitchell shows base of pilaster 13ins. over boundary. Would this be allowed? (2) When a section of foundations to a shop front 36ft. wide is asked for at an examination, would it be advisable to show a basement with pavement lights and bulk-head, &c.?"

(1) The passage to which you refer applies to any kind of projection beyond the frontage line. In some cases the rule that there shall be no projection whatever is rigidly enforced, but, speaking generally, the question depends upon the reasonableness or otherwise of the local authority enforcing the by-laws in the particular district. (2) In an examination question you would probably be told exactly what is required, but in case of obscurity the method you suggest would no doubt form an excellent answer.

F. S. I.

Oak Gate-posts.

LONDON.—W. J. C. & S. write: "Is there any wood more durable and as cheap as oak for front gate-posts? We have fixed large numbers of 8 x 8 and 10 x 10 oak posts, and find that in seven or eight years they rot nearly through on the ground line. This may be due of course to sap in some cases, as we find it difficult to obtain oak without sap in the sizes mentioned."

We suggest jarrah and karri.

Articles.

BROMSGROVE.—F. E. O. writes: "My brother while studying at a school of art took a liking to architectural design, and with the idea of getting practical experience came to terms with a firm of builders to learn the different branches in their shops. He is now acting as assistant to a fairly well-known architect. Will his lack of articles handicap him in obtaining a position as architect or

assistant with a larger firm of architects, or is it possible to purchase his articles?"

The fact of having been articled does not prove anyone to be duly qualified as an architect or to have ability. We do not think the want of articles is detrimental to an architect or his assistant. What is necessary is that an assistant should have ability and be able to prove it by testimonials and examples of his work. The possession of certificates of having passed examinations is also undoubtedly a help, and we should advise every student to take the examinations of the Royal Institute of British Architects. The Surveyors' Institution examinations are also to be recommended for those taking up that particular branch of professional practice.

NEW LONDON BUILDINGS.

AT last week's meeting of the London County Council the Building Act Committee reported the following application under the London Building Act, 1894, their consent or refusal being appended in italics:—

A shop front at No. 119, Pall Mall, on the application of J. A. Minty, on behalf of Hugh Rees, Ltd. (*Consent.*)

A new shop front with entablature at No. 56, High Road, Kilburn, on the application of G. A. Sexton, on behalf of D. Fearn & Co. (*Consent.*)

Projecting sign and two show cases at the "Green Shade," Argyl Street, Oxford Street, on the application of W. Lockwood, on behalf of A. Weiner. (*Consent.*)

Retention of three projecting signs at Nos. 22 and 23, Long Acre, on the application of Windover, Turrill & Sons. (*Consent.*)

Projecting sign at No. 252, Tottenham Court Road, on the application of Wakelin & Co., on behalf of Wolfe & Hollander, Ltd. (*Consent.*)

Projecting sign at No. 18, Archer Street, Kensington, on the application of W. Douglas, on behalf of the British and Continental Drug Co. (*Consent.*)

A projecting sign at No. 50, King Street, Regent Street, on the application of R. H. Kerr, on behalf of Chapman. (*Consent.*)

Projecting sign at No. 4, Foubert's Place, Regent Street, on the application of R. H. Kerr, on behalf of Chapman. (*Consent.*)

Projecting sign in front of No. 12r, Victoria Street, Westminster, on the application of A. C. Forrester, on behalf of F. Hazell. (*Consent.*)

Projecting sign at No. 26, Gray's Inn Road, Holborn, on the application of Caspar & Co. (*Consent.*)

Projecting porches at Nos. 48, 50 and 58, and to the erection of a similar porch at No. 52, Forest Hill Road, Lewisham, on the application of J. Newton. (*Consent.*)

A building on the northern side of Broughton Road, westward of Stephendale Road, Fulham, on the application of Badenoch & Bruce, on behalf of the directors of the Sunlight Laundry Co. (*Consent.*)

Projecting clock at No. 108, Norwood Road, Norwood, on the application of Gillett & Johnston, on behalf of M. Philcox. (*Consent.*)

Three houses on a site abutting upon the northern side of Warple Way and western side of Warple Road, Wandsworth, with external walls and forecourt boundary at less than the prescribed distance from the centre of the roadway of Warple Road, on the application of F. Dolley. (*Consent.*)

An addition to a block of dwelling-houses to be inhabited by persons of the working class on the north side of Sumner Street, Southwark, on the application of F. Bailey, on behalf of the City of London Electric Lighting Co., Ltd. (*Consent.*)

Buildings on the east side of Georgette Place, King George Street, Greenwich, with external walls and forecourt boundaries at less than the prescribed distance from the centre of the roadway of Georgette Place, on the application of H. Adams. (*Refusal.*)

Buildings upon the site of Nos. 232, 234, 236 and 238A, Rommany Road, West Norwood, on the application of J. Stevens. (*Consent.*)

Retention of a wood and glass addition upon the bay window in front of No. 124, Victoria Street, Westminster, on the application of Griffin & Woollard, on behalf of J. B. Martin. (*Consent.*)

Retention of a building on the western side of Church Path, Stoke Newington, on the application of W. F. May, on behalf of J. Gregory. (*Consent.*)

A kiosk at the western end of the Hyde Park Hotel, Knightsbridge, on the application of F. Gregory, on behalf of Newitt & Phillipp. (*Refusal.*)

Re-erection of No. 4, George Street, Woolwich, on the application of J. O. Cook, on behalf of J. Frankling & Son. (*Refusal.*)

A workshop building on the northern side of Richmond Terrace, Clapham Road, Kennington, westward of No. 90, Clapham Road, with the forecourt boundary at less than the prescribed distance from the centre of the roadway of Richmond Terrace, on the further application of J. A. J. Woodward & Son, on behalf of C. Blachford. (*Consent.*)

Retention of a wood and iron structure of a temporary character erected on the forecourt of No. 48, Victoria

Road, Kensington, on the application of W. K. Peirson, on behalf of A. J. de Beaufort. (Consent.)

Alterations at No. 7, Noel Street, Soho, on application of G. C. Lambert. (Consent.)

New streets on the Durnsford Park Estate, Merton Road, Wandsworth, on application of R. C. Gordon, on behalf of A. Wise. (Consent.)

New streets, for foot traffic only, upon a site on the south side of Fashion Street, Commercial Street, Whitechapel, on application of A. Davis. (Consent.)

Alterations to No. 28, High Street, Putney, on application of H. Bignold. (Consent.)

The Theatres and Music Halls Committee reported having considered the following:—

A plan, submitted by Blow and Billerey, showing stalls seating at the Avenue Theatre. (Refusal.)

A plan, submitted by W. Bartholomew on behalf of J. H. Beare, for a new hall which has been erected on the land adjoining the minor hall at the Balham Assembly Rooms. (Approval.)

Plans, submitted by F. Matcham & Co., on behalf of Moss Empires, Ltd., showing arrangements proposed to be adopted in the erection of a music hall, to be known as the Finsbury Park Empire, on a site at the junction of St. Thomas's Road and Prahr Road, Finsbury Park. Accommodation is shown for an audience of 2,138 seated and 535 standing. (Approval.)

Plans, submitted by F. W. Hingston on behalf of Walter Stephens, showing arrangements to be adopted in the construction of a music hall to be known as the Kilburn Vaudeville Theatre, proposed to be erected at Kilburn High Road, with a frontage on Kilburn Priory, and in respect of which an application has been made for a music and dancing licence. Accommodation is shown for an audience of 1,629 seated and 284 standing. (Approval.)

Plans, submitted by Smee & Cobay on behalf of Miss Kate Santley, for raising the stage roof at the Royalty Theatre and providing a new staircase and dispensing with the existing staircase from the stalls corridor to the basement, opening on to the stairs from the pit saloon to the pit entrance. (Approval.)

A plan, submitted by J. G. W. Buckle on behalf of J. N. Maskelyne, showing a proposal to convert the present vestibule to the offices on the first floor at St. George's Hall, Langham Place, into a refreshment bar for the use of the balcony audience. (Approval.)

Plans, submitted by H. & G. Taylor, of a proposed alteration in the arrangement of the gentlemen's retiring room at the Sportsbank Hall, Catford. (Approval.)

Plans, submitted by F. T. Verity, showing a proposed new staircase to lead from the box circle level up to the grand foyer at the Empire Theatre of Varieties. (Approval.)

Plans, submitted by Nelson Francis, showing the position of the cinematograph apparatus box which has been fixed in the gentlemen's lavatory, at the back of the balcony at the Empire Theatre of Varieties. (Approval.)

Plans, submitted by A. Corder on behalf of the Rev. Andrew Mearns, showing the alterations which have been made to the Murphy Memorial Hall. (Approval.)

A plan, submitted by Dióyal Symons, showing a proposal to discontinue the use of two staircases at the eastern end of the gallery at Olympia as emergency exits and to use a room on the gallery level for electrophone purposes. (Approval.)

Plans, submitted by Bull & Bull, showing the arrangement of the seating at Olympia, proposed to be adopted in connection with the use of the premises as a winter sports club during the winter. (Approval.)

Plan, submitted by the Town Clerk of the Metropolitan Borough of Paddington, showing a proposal to remove the dressing boxes from the sides of the men's first-class swimming bath at the Paddington Public Baths, when it is converted into a concert hall, and to provide platforms 3ft. 6ins. in width and 6ins. in height in their place, the platforms to be occupied by a single row of chairs. (Approval.)

At yesterday's meeting the Committee reported the following applications under the London Building Act, 1894:—

Buildings on a site abutting upon the southern side of West End Lane and eastern side of Credition Road, Hampstead, on the application of R. L. Pearce, on behalf of the Middlesex Building Co. (Consent.)

Three-storey buildings with shops on the eastern side of Garratt Lane, Wandsworth, northward of St. Andrew's Church, on the application of L. S. Rogers, on behalf of J. & R. Heard. (Consent.)

Iron and glass hood over the entrance to No. 148, Goldhurst Terrace, South Hampstead, on the application of James & Laycock, on behalf of Mrs. Beedell. (Consent.)

Three houses with shops on a site abutting upon the west side of Grove Lane and north side of Champion Grove, Camberwell, on the application of R. L. Freeman, on behalf of T. Freeman. (Consent.)

Buildings on the west side of Wordsworth Road, Stoke Newington, southward of the Baptist chapel, on the application of C. M. Cobb, on behalf of A. J. Weibking. (Consent.)

An iron and glass porch at No. 1, Hyde Park Terrace, Bayswater Road, Paddington, on the application of R. L. Cole, on behalf of S. N. Braithwaite. (Consent.)

Buildings on the site of Nos. 66, 67 and 68, Clapham Common, South Side, Clapham, on the application of Homer & Lucas. (Refusal.)

Mission hall upon the site of Nos. 211 and 213, Sydenham Road, Lewisham, with a boundary fence at less than the prescribed distance from the centre of the roadway of Laurel Grove, on the application of E. Harper & Brother. (Consent.)

The formation or laying-out of new streets for foot traffic only, and in connection therewith the erection of buildings and an iron and glass shelter upon a site on the southern side of Highgate Hill and western side of

Junction Road, Islington, on the application of C. W. Callcott, on behalf of J. W. Galton. (Consent.)

Buildings on a site abutting upon the east side of Urswick Road, south side of Lesbia Road, and north side of College Avenue, Hackney, on the application of J. G. Tewson, on behalf of D. Burnett. (Consent.)

A sign on the ridge, and electric lamps round three sides of the iron and glass shelter at Hatchett's Restaurant, Piccadilly, on the application of W. M. Kolton. (Consent.)

An addition at the rear of No. 292, Merton Road, Wandsworth, to abut upon Standon Road, on the application of W. G. James, on behalf of H. J. Bailey. (Consent.)

Crane opposite Nos. 42 and 44, Bankside, Southwark, on the application of A. Harrison, on behalf of the Council of the Metropolitan Borough of Southwark. (Consent.)

Deviations from the plans and sections sanctioned on the 31st day of January, 1905, and 1st day of August, 1905, for the formation or laying-out of new streets on the St. Quintin Estate, Quintin Avenue, Kensington, on the application of Trant, Brown & Humphreys. (Consent.)

A modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of a house on the north-western side of Atherfold Street, Clapham, on the further application of V. Vagnolini, on behalf of W. P. Goosey. (Consent.)

A modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of three blocks of artisans' dwellings on a site on the east side of Stockwell Road and south side of Moat Place, Brixton, with irregular open spaces at the rear, on the application of P. Tree, on behalf of Foster's Trustees. (Consent.)

A modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of a building on Lot 2, Tower Bridge Road, Bermondsey, on the application of Barlow, Roberts & Thompson. (Consent.)

A modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of eleven houses on the northern side of Lamerton Street, Deptford, on the application of G. A. Lansdown, on behalf of J. E. Lamerton. (Refusal.)

Means of escape in case of fire, proposed to be provided in pursuance of section 63 of the London Building Act, 1894, on the topmost storey of Nos. 226 and 227, Piccadilly, the upper surface of the floor of which storey is above 60ft. from the street level, on the application of H. A. Woodington. (Consent.)

Keystones.

Change of Address.—Messrs. Knightley & Batterbury have removed their offices from 106, Cannon Street to Birkbeck Bank Chambers, Chancery Lane, W.C.

Messrs. Foyers & Penman, architects, of Largs, have been asked by Mr. George Coats to design extensive enlargements and alterations on his highland mansion of Glen Tana.

The National Monument to Victor Emmanuel at Rome.—The Minister of Public Works has appointed three architects (Signori Pio Piacentini, Gaetano Koch and Manfredo Manfredi) to continue this unfinished work of Count Sacconi, who died a short time ago. The selection seems to be disapproved in many quarters.

Proposed new Infirmary for Plymouth.—After an uproarious meeting the Plymouth Board of Guardians decided last week to approve the plans for their proposed new workhouse infirmary which had been drawn up by Messrs. Thornely & Rooke, architects, of Plymouth and Devonport. These plans will now go before the Local Government Board. A scheme was prepared some time ago, estimated to cost £56,000, but was rejected as being too expensive. The revised scheme provides for 300 patients and 21 nurses, and, at £100 per bed, is estimated to cost something over £30,000. The wards are grouped centrally around the administrative block.

Iona.—In a paper on "The Shrine of St. Columba at Iona" read recently at Glasgow University Mr. John Honeyman, LL.D., R.S.A., said there were indications that at one period—probably in the beginning of the thirteenth century—the choir of the Abbey Church had beneath its east end a crypt with side aisles. He thought that enough remained at Iona to show that the general arrangement of the plan at Amalfi, Iona, and the original crypt at Glasgow were similar, and gave reasons for believing that they were intended to serve the same purpose, namely, to cover the grave or preserve the relics of the patron saint in such a position

that when the choir was built the high altar might be placed exactly over the consecrated spot below.

New Premises for the National Society in Great Peter Street, London, S.W., have been built from designs by Mr. H. W. Burrows, F.R.I.B.A., F.G.S.

Sheffield Society of Architects and Surveyors.—At last Thursday's meeting Mr. J. R. Wigfull, A.R.I.B.A., delivered the second of his series of lectures on "English Renaissance Architecture," dealing with the period from 1600 to 1650.

Savoy Chapel Re-decorated.—After extensive re-decoration of the interior by order of the King, the Royal Chapel of the Savoy has been reopened. The work has been done by Messrs. Clayton & Bell. The chief aim was to lighten the interior, to which end the roof has been treated on a field of white. The walls also are much lighter in effect.

The Leeds Memorial to Queen Victoria, which has been erected in front of the Town Hall, was unveiled on Monday by the Lord Mayor (Mr. Edwin Woodhouse). The monument consists of a bronze seated statue of Queen Victoria, 9ft. 6½ins. high, on a square stone pedestal which rises to a height of 20ft. On either side of the pedestal are bronze figures, each 7ft. 6½ins. high, representing Peace and Industry. The sculptor was Mr. G. J. Frampton, R.A.

The Society of Architects has made a special donation of fifty guineas to the funds of the Architects' Benevolent Society in response to Mr. Belcher's recent appeal, and Mr. Walter W. Thomas, the immediate past-president of the Society, has given ten guineas, while other members have intimated their intention of also contributing.—The following have been elected members of the Society:—R. H. Boyd (Tooting Common), E. W. Burnet (Bridgend), G. W. Davis (Darlington), E. Drew (Swindon), A. H. Fitzgerald (North Shields), H. F. Keighley (Accrington), A. G. Latham (Birmingham), A. J. McDonnell (Forest Gate), F. Mountain (Oxford), H. E. Nicholls (Swindon), H. E. Priestley (Bradford), C. W. W. Thompson (Rochester). The following have been elected students of the Society:—W. J. Clements (Skewen, near Neath), A. H. Dungay (Camberley), F. Wakeling (Southall).

Restoration of St. Columb Major Church.—The venerable church of St. Columb Major, Cornwall, which has been undergoing renovation during the past five years (under the direction of Mr. G. H. Fellowes Prynne) was reopened on Wednesday last. The church dates from about the twelfth century, but little of the original structure remains. The present edifice, undoubtedly one of the finest in Cornwall, is in the main of fifteenth-century work, of Pentewan and Caen stone. Irreparable damage was done to the church, however, during the restoration of fifty years ago, when the whole form of the original chancel and side chapel roofs was altered, and the fine old oak barrel roofs with carved ribs and bosses were replaced by commonplace open timber deal roofs. The cost of the present restoration has been nearly £6,000. The completed work comprises the nave, aisle and transept roofs, which have been renewed, re-using the old carved oak ribs, plates and bosses as far as possible, and keeping the existing forms of roof intact, while new bosses have been added. The ringers' floor has been repaired, the clock and belfry floors and tower roof have been entirely renewed in oak, and the peal of eight bells has been rehung, whilst the tower has been thoroughly restored. A new feature is a richly-carved oak chancel arch, which completely hides the unsightly opening formerly existing where the chancel and nave roofs met.

Complete List of Contracts Open.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
BUILDING:			
Nov. 30	Edinburgh—Additions to Asylum	Royal Blind Asylum	Henny & Macleaman, Architects, 7 South Charlotte Street, Edinburgh.

A STEELWORK REFERENCE BOOK.

UNDER this heading we review the new catalogue just issued by Messrs. Redpath, Brown & Co., Ltd., because it is far different to the usual trade catalogue, being more of a reference book: it would indeed be useful to students, though designed more particularly for the use of architects and contractors. The book treats of girders and stanchions. Both of the parts dealing with these are introduced by short general discussions on the points to be observed in practice, and the methods of calculating the section required for a given stress. This is followed by a series of tables printed with black figures divided by lines in red so as to make reference easy. The book is compiled after the British standard sections, and therefore will be appreciated at the present moment, in view of the fact that most of the catalogues in circulation were drawn up before the issue of the specification by the committee. The tables of strength for beams are based on the maximum fibre stress of $7\frac{1}{2}$ tons per sq. in., which is a factor of safety of 4, the usual strength of steel being found to be 30 tons per sq. in. when tested. Messrs. Redpath, Brown & Co. are specially to be commended in this respect because many other manufacturers base their tables upon a factor of safety of 3, giving a fibre stress of $10\frac{3}{4}$ tons per sq. in., which is not safe in practice: in fact, this firm has spared no pains to make everything thoroughly clear, and there is no suggestion of deceiving the profession. The tables for the strength of stanchions are also compiled on the basis of a factor of safety of 4. In connection with each division of the book there are also included practical notes, such as upon the deflection in girders when the span exceeds twenty-two times the depth of the girder, upon side yielding when the length exceeds twenty times the width of the flange and is unbraced, and upon the connections between joists parallel and at right angles, rivets, &c. In the same way in regard to stanchions practical notes are included on bases, caps, brackets, foundations, &c. We think this portion of the subject could have been improved by including information upon the eccentric loading of stanchions and the forms most suitable for connection on the job, and forms most economical in manufacture. Very often sections are used which cannot be properly riveted in the shops, and others which are not convenient for erection on a job and render field riveting difficult and inefficient. Again, the suggested grillage foundation illustrated is not quite the best practice, although we know it has been adopted in many cases. The joists should be separated by cast-iron separators or held by plates riveted over them.

The book concludes with a series of very useful tables of sectional areas, moments of inertia, standard spacing for holes, standard connecting clips for joists, weights of floors and materials, live loads, fireproofing, powers, logarithms, reciprocals, circumferences and circular areas, natural sines, &c.; trigonometrical data, British and metric equivalents, &c., and a number of diagrams and fine views of the firm's various large works in London, Edinburgh, Manchester and Glasgow. The company's works are equipped with the most modern plant for constructional work; and large stocks of British standard sections, in accordance with the recommendations of the Engineering Standards Committee, have been laid down. The new works at East Greenwich have only been in operation for about eighteen months, but during that time several important contracts have been carried out for work in London and abroad.

"Handbook of Constructional Steelwork." Edinburgh: Redpath, Brown & Co., 2, St. Andrew Square. London: Riverside Works, East Greenwich, S.E.

Trade and Craft.**A Roofing and Walling Material.**

A new catalogue has just been issued by the British Uralite Co., Ltd., of 50, Cannon Street, London. This is a very sensible one, succinctly giving the chief claims for "Uralite," practical notes on how to use it, with weights for the different sizes of slabs and slates made of this material, and well-reproduced illustrations of buildings executed with it. Manufacturers too often provide little useful practical information, preferring to reprint laudations on their goods often in ungrammatical and coarse language with sheaves of testimonials (if they are so fortunate as to possess them). We are glad to see this firm setting a good example. Its catalogue is just of the right kind. It may be mentioned that while "Uralite" is extremely light it has both stiffness and great fire-resistance, so much so that it can be insured at the minimum premium.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.K.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending November 24th twenty-one failures in the building and timber trades in England and Wales were gazetted.

J. A. PAPE, plumber, Workington. R.O. Nov. 13th.

G. BROCK, builder, Longstock. Adj. Nov. 13th.

J. W. COLLINS, builder, Portsmouth. R.O. Nov. 17th.

J. FLOWITT, builder, Doncaster. R.O. Nov. 13th.

J. W. SMALLWOOD, painter and decorator, Todmorden. R.O. Nov. 14th.

C. FIELDING, builder and contractor, Glossop. De-ficiency £609.

W. SMITH, builder and contractor, Farnborough (late Blackwater and Ilford). Adj. Nov. 14th.

A. G. DEANE, builder and decorator, Reading. First meeting, Queen's Hotel, Reading, Nov. 30th, at 1. P.E., Assize Courts, Reading, Nov. 30th, at 3.

H. PRESSLER, plumber and decorator, &c., Chorley. First meeting, 19, Exchange Street, Bolton, Nov. 29th, at 3. P.E., Bolton C.C., Dec. 13th, at 3.

S. MASON, builder and contractor, Streethouse, Pontefract. First meeting, O.R.'s, Wakefield, Nov. 29th, at 11. P.E., Wakefield C.C., Dec. 7th, at 11.

R. M. MOSS, builder, Doncaster. First meeting, O.R.'s, Sheffield, Nov. 30th, at 12.30. P.E., Sheffield C.C., Nov. 30th, at 2.

JONES & CATHALL, plumbers, &c., Wrexham. First meeting, Crypt Chambers, Chester, Nov. 29th, at 12. P.E., Wrexham Town Hall, Dec. 12th, at 12.

H. T. ROBERTS, architect, Rhyl. First meeting, Crypt Chambers, Chester, Nov. 29th, at 3.15. P.E., Magistrates' Room, Bangor, Dec. 7th, at 12.30.

Coming Events.**Wednesday, November 29.**

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. T. Haddon on "A Practical Demonstration of Wrought-iron Work," at 8 p.m.

Friday, December 1.

ARCHITECTURAL ASSOCIATION.—Mr. E. F. Reynolds on "Turkish Architecture," at 7.30 p.m.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Mr. J. Starkie Gardner on "Metal Applied as External Decoration to Buildings," at 6.45 p.m.

Saturday, December 2.

INCORPORATED BRITISH INSTITUTE OF CERTIFIED CARPENTERS.—Annual General Meeting, Carpenters' Hall, London Wall, at 6.15 p.m.

Monday, December 4.

LIVERPOOL ARCHITECTURAL SOCIETY.—Mr. E. A. Rickards on "Intention in Ornament."

Tuesday, December 5.

- 1521.—GENERAL or WORKING FOREMAN JOINER; plans, working drawings; good refs.; life abstanter.

See p. xx for the Employment Register.

Notice to Advertisers.

"We wish to say that our advertisement in your valuable paper has brought us a large number of new customers and still increasing. We have now opened a Railway Depot to deal with the Stone trade."

The above is an extract from a letter received on Monday morning last from a firm who have regularly advertised in the "Builders' Journal" for the past two years, and which proves in unmistakable fashion the unequalled value of this Journal to Advertisers.

Contracts Open.

BOROUGH OF FULHAM.

The Council of the above Borough is prepared, at its Meeting to be held on WEDNESDAY, the 6th day of DECEMBER, 1905, at 7 p.m., to receive TENDERS for MAKING-UP the CARRIAGE-WAY of Finlay Street, Fulham.

Plans and Specifications of the works may be seen, and any information obtained, from Mr. FRANCIS WOOD, A.M.I.C.E., F.G.S., Borough Surveyor, at his office, Town Hall, Fulham, S.W.

The Contractors are to attend personally, or be represented at the Council Meeting, to deliver their own Tenders, together with a £0 note and a Schedule of Prices, upon which the value of any extras or omissions shall be based, and to make a declaration that they pay the trade union rate of wages, observe such hours of labour as are generally accepted as fair in their trade, and that all unskilled labour shall be paid the minimum wage of 7d. per hour.

The Council does not pledge itself to accept the lowest or any Tender.

Town Hall, Fulham. R. M. PRESCOTT, Town Clerk.

TOTTENHAM EDUCATION COMMITTEE.

TENDERS are hereby invited for the ERECTION of a SCHOOL to accommodate 1,200 children on the Parkhurst Road Site, Tottenham.

Applications for quantities to be made to the Architect, Mr. G. E. T. LAURENCE, A.R.I.B.A., 22, Buckingham Street, Adelphi, W.C., on or before the 9th DECEMBER next, after which date plans and specifications may be seen at his office.

The sum of two guineas will be charged for the quantities, which sum will be returned on receipt of a bona fide Tender, accompanied by the conditions and priced quantities, otherwise the deposit will be forfeited.

The priced quantities will be returned to the unsuccessful firms.

Persons Tendering will be required to deposit with the CLERK, when handing in their Tenders, in Bank of England notes or cash, the sum of ten pounds, which will be forfeited by the person whose Tender is accepted if the Contract be not executed within seven days from the date he is informed it is ready for signature.

This deposit will be repaid to the parties Tendering who are unsuccessful.

The Contractor will be required to pay all workmen on the Committee's work the recognised trade union rate of wages.

The Committee do not bind themselves to accept the lowest or any Tender.

Signed W. MALLINSON,
Clerk to the Committee.
Education Committee Offices,
Philip Lane,
South Tottenham,
22nd November, 1905.

To Contributors.

THE EDITOR will be pleased to consider any articles illustrated or otherwise, dealing with old and new buildings, methods of construction, or other matter of an architectural character. He will also be glad to consider architectural photographs and sketches (the latter preferably in black and white) and measured drawings of work in this country or abroad. News items of interest to architects and builders will also be considered, provided the name and address of the sender are given; no notice will be taken of anonymous contributions. All communications should be addressed to the Editor of THE BUILDERS' JOURNAL, 6, Great New Street, E.C.

THE VALUE OF OUR EMPLOYMENT REGISTER.

THIS REGISTER was commenced as a serious endeavour on our part to meet a need that is continually felt both by EMPLOYERS and EMPLOYED, and we are pleased at the practical appreciation that has been shown by our readers since THE REGISTER was first started.

Nothing is more trying than to be out of employment, but the difficulty of the position is terribly augmented when money has constantly to be paid for advertisements in order to find other occupation.

On the other hand an Employer who has just obtained an important contract most likely needs you; and has a post to fill that you are wanting, but neither of you can find each other.

THE REGISTER serves this purpose and so meets both cases. For those wanting employment it is an inexpensive means of keeping their names and qualifications before the right people, and for the Employer it is a ready means of finding just the man he wants, without delay.

We are encouraged to find how largely our columns have been instrumental in meeting the requirements of both parties in the manner indicated above, and we thank those advertisers who have written expressing their pleasure and indebtedness to THE REGISTER.

Many have found it an invaluable aid in getting appointments, and we would urge all those who are out of work, or want to change their situations, in fact, all who have a "want," to make use of these columns and thus make THE REGISTER a record of still more value to Employers and Employed.

For 3s. we give 3 insertions (four lines), in our "Appts. Wanted" Columns, and also 6 insertions in the "EMPLOYMENT REGISTER" (see page xx).

5 O'CLOCK P.M. MONDAY IS THE LATEST TIME FOR RECEIVING "WANT" ADVERTISEMENTS.
OFFICE: 6, GREAT NEW STREET, FETTER LANE, E.C.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

December 6, 1905. Vol. 22, No. 565.

6, Great New Street, Fetter Lane, E.C.

Summary.

In Constantinople within little more than a hundred years seven great mosques were built by the Turks. Of these the Suleimaniyeh, the third mosque of Sultan Suleiman, in point of size and natural position dominates almost all the city. This mosque is 227ft. wide and 203ft. long, and with its forecourt makes up a length of 359ft. The diameter of the dome is 85ft. 4ins., as compared with 101ft. 8ins. of Santa Sophia. Another great mosque is that of Ahmed I., which is almost as big as the Suleimaniyeh, and especially noticeable for its six minarets. (Page 320.)

At Peterston, near Cardiff, a garden city, to be called "Coryville," is proposed to be laid out by Mr. John Cory. The plan is circular, with a green in the centre, from which avenues radiate. Each house will be allotted a good-sized piece of ground, and a scheme is being prepared by which 80 or 85 per cent. of the money for building the houses will be provided on security of the lease, thus enabling small holders to occupy their own houses. (Page 326.)

Professor Simpson is writing a history of architecture, to be published in three volumes. The first has just been published, and forms a serviceable introduction to the subject. (Page 327.)

In the competition for the proposed central library for Hackney the replies to competitors' questions are unsatisfactory, more especially in regard to the leading question as to the author of the first-premiated design being appointed to carry out the work. In an interview which a competitor had with the town clerk the latter said he had no reason to suppose that the council intended to adopt any but the usual course. This is satisfactory so far as it goes, but it is not sufficient. (Page 329.)

At Darlington last week a builder was fined £10 and costs for putting joists too far apart and laying concrete 2ins. thick instead of 6ins. (Page 332.)

Wren's house in Botolph Lane, Eastcheap, was put up for sale last week, but withdrawn, nothing higher than £6,750 being offered for it. (Page 329.)

The Birmingham City Council have decided to erect additional municipal offices and an extension of the art gallery, estimated to cost £150,000, and an open competition for designs is to be held. (Page 330.)

Architectural and Building Events of 1905.

WITH our issue for December 27th we shall publish an illustrated review of the building and architectural events of 1905, following the experiment of last year, which was so highly successful. The field covered by this review is naturally very extensive. By our ordinary news channels we are kept in touch with new buildings being erected or completed in every part of the kingdom, as well as abroad, but it is clearly impossible for us to be cognizant of everything that takes place. We therefore seek the aid of readers throughout the country, to whom we shall be grateful for a note of anything important which has been done or is contemplated in their several districts. Possibly the information may overlap that already in our possession, but, on the other hand, there may be some important work which has escaped our attention. The review is quite unique of its kind, and nothing on the same scale has been done before by any other journal, so far as architecture and building are concerned.

The Unemployed and the Building Trades.

EVERYBODY is now talking and thinking of the unemployed problem. It is opportune therefore to make a few remarks on the subject from the point of view of the building trades. In winter-time these trades are always slack, and consequently distress becomes more acute. The building trades are of course dependent upon the general trades for their work, and just now there is exceptional slackness due to several years of bad trade. It must not be forgotten that the building industry is the last to feel bad trade and the last to benefit by a revival, which may be a year or two behind that of the general trade of the country. It is satisfactory, however, to note that trade is now reviving, and as a consequence we may hope that soon the building industry will gain an impetus. But there are other aspects of the question which may be considered. It seems to be an accepted article of belief that it is foolish to enter upon building works during wintry weather. Frost, fogs and rain seem to be regarded as factors likely to increase the cost of or to prevent safe building. In colder climates, however, the building trades are carried on in winter, measures being taken to overcome the danger from frost at least; as one instance of this we may recall the

fact recorded by our Consul at Christiania that bricklaying is there executed in frosty weather by the use of unslaked lime. Portland cement, too, is not much affected by frost, and by using sacking or tarpaulins to cover walls the final remedy is secured. When ground is hard it cannot be excavated, but it seldom remains so for long. Intemperate weather is no doubt a deterrent on many works. In heavy rain a large number of men in the early stages of a building would necessarily be forced to stand down, but when a building is more advanced the floors and roofs often enable work in the interior to be carried on in wet weather. Fog chiefly causes delay by interfering with the delivery of materials, but storage on the site should overcome this. It is apparent that in the country especially men and carts and horses are to a large extent idle, not being employed upon the land, and thus cheap cartage of materials could be obtained. Somewhat in the same way the general slackness of trade may be reckoned to cheapen the cost of labour. We are afraid, however, that distress in the building trades is almost inevitably due to the law of supply and demand. Our education has unfortunately not been framed to deal with this factor, so that a man usually knows only one trade, while many are unskilled in any trade. After all, the building trade does not serve one of the fundamental necessities of living, and so it is essentially dependent upon those industries which do.

A Model Essay. STUDENTS ought to have their attention called to the paper on "Turkish Architecture" read last Friday before the Architectural Association by Mr. E. F. Reynolds. It is an excellent model to follow. The subject is an original one and embodies the result of personal research in a field practically unexplored, and it is interesting to observe how well the author has traced the development of the architecture from the constructive needs, and how he has compared and discussed the principles there employed and the results obtained. There are many opportunities for similar investigation in other countries, and students who have the chance (such as was afforded Mr. Reynolds by winning the Soane Medallion) to visit foreign lands would do well to follow his example.

TURKISH MOSQUES.

By E. F. REYNOLDS.

ON Friday evening at 18, Tufton Street, Westminster, Mr. E. F. Reynolds read an extremely interesting paper on "Turkish Architecture" before the Architectural Association (Mr. John Murray, vice-president, in the chair). The lecture was illustrated by a number of lantern slides and drawings. It is here illustrated by a selection of photographs of the chief mosques dealt with in the paper, with the exception of Santa Sophia, which has been omitted for the reason that it is, of course, not a Turkish mosque, and, moreover, it is so very well known to all students of architecture.

Difficulties.

Mr. Reynolds observed that the student of Turkish architecture was confronted by a somewhat unusual initial difficulty. He found that there were few authorities on the subject, that they gave but meagre information, and that much of the information was inaccurate and misleading. And even though the student proceeded to Turkey, he would find very little opportunity to study the buildings on the spot. Religious fanaticism and political suspicion had almost closed Turkish doors against the inquisitive architectural infidel, and only by the most exceptional good fortune might the right to enter, sketch and measure be obtained. Through the courtesy of the Royal Institute of British Architects and the British Embassy at Constantinople such good fortune was Mr. Reynolds's, so that, in company with Mr. J. B. Fulton, he was able to study the subject thoroughly.

The Mohammedan religion has been as powerfully represented in building as the Christian religion, and Turkish mosques represent the most impressive and a most characteristic phase of Turkish architecture. To this aspect of it Mr. Reynolds confined himself in the present paper, entirely disregarding the palaces, the castles, the bazaars and the domestic buildings which show other aspects of the same art. He confined himself, in fact, almost exclusively to the great mosques of Constantinople.

The following is a summary of his remarks.

Two Mosques at Brusa.

In approaching our subject we may take a preliminary glance at two mosques at Brusa, the Turkish capital in Asia Minor before the conquest of Constantinople. Ulu Jami, the Great Mosque, represents a type of plan derived from the original courtyard type, the rectangle of the building being divided by massive piers and arches into twenty square bays, each covered with a cupola set on pendentives, except one central bay, which remains open to the sky. The other mosque, Yeshil Jami, or the Green Mosque, was built in 1420, and represents a complex variety of the later cruciform type of plan, this complexity being due to the fact that the mosque was built on the site of a Byzantine church, and also because it was the royal mosque, and, therefore, included special chambers for the Sultan. The whole building is a storehouse of an early Turkish art full of Persian influence, and it realizes an effect of the utmost luxury and beauty.

These two mosques may be taken as typical of Turkish building prior to the conquest of Constantinople, differing from other Saracenic work of the time only as varieties of the main stock, closely related to the mosques of Egypt and Persia, and perfectly normal in development.

Santa Sophia.

With the conquest of Constantinople, however, the natural growth of Turkish mosque building was radically modified by a new influence—by that of a single building indeed—Santa Sophia. Rumours of the splendour of the church had long been current in the East,

THE MOSQUE OF BAYEZID.

and Mohammed himself had prophesied its conversion to a mosque. The Turks, therefore, regarded it as a predestined possession, and it may be that we owe its preservation to this view. But, not content with its possession, the Turks emulated its qualities, and henceforward they founded all their great mosques on its model, disregarding their own traditional forms or altering them in unison with their new ideal.

Characteristics of the Turk.

The change was probably less due to real aesthetic appreciation than to a desire to invest their own religion with an easily-adapted magnificence. The Turks were a military rather than an artistic race. They had little of the subtle instinct of the artist. To them art was a slave to minister to their pomp and luxury rather than a spirit to be sought with toil and glad self-sacrifice. A close parallel may, indeed, be drawn between the character of the Turk and the Roman, and the comparison is rendered more striking

by the similarity of experience in their contact with the art of another race. But whereas the Romans had adopted Greek forms for the decoration of their own structure, thereby stifling the expressive evolution of its true qualities, the Turks, on the other hand, adopted only the plan-type of Santa Sophia, leaving themselves free to adapt and develop it in accordance with their need, and to clothe it with fresh expression by a thoroughly Saracenic mode of decoration.

Requirements of Ritual.

The requirements of Mohammedan ritual are simpler than those of Christian ritual. The mosque proper is preceded by a forecourt, which gives additional space for the crowds of the faithful who assemble at the great festivals, and at the centre is placed a fountain of ablution. The mosque itself provides a sheltered place for prayer, and, so long as sufficient floor-space is provided its general shape may vary very considerably. A small niche in the centre of the eastern

THE MOSQUE OF SHAH-ZADEH.

wall indicates the direction of Mecca, but has no such ceremonial significance as the altar in the Christian church.

Applying these conditions to Santa Sophia, it is evident that, although simplification was necessary, yet in its main lines the plan was eminently suited to Mohammedan ritual. The broad unbroken space under the dome and semi-domes precisely fulfilled the conditions of Mohammedan worship, and it was this principle of covering a large area which was the main theme of the subsequent Turkish mosques. The aisles of Santa Sophia, necessary to give depth of abutment to the great arches of the dome, were also retained, but their subdivision in height by galleries was discontinued. These galleries had been reserved for the use of women in the Christian Church; but a Mohammedan controversy had decided that women have no souls, and their galleries were accordingly abolished in future mosques. The exedrae, or subsidiary apses, seem to have been regarded as obstructions to that broad floor-space which was the Mohammedan ideal, and the whole tendency of mosque construction was toward a great square described around four isolated piers which sustained the central dome.

The Great Era of Mosque Building.

The mosques were built on a grand scale, and the more powerful Sultans successively vied with each other in erecting a magnificent tribute to Allah and a convincing proof of their own power. Several of the mosques approach Santa Sophia in size, but perhaps more astonishing than their size is the sustained, yet concentrated, energy of their building. Within little more than a hundred years some seven great mosques were built in Constantinople which are definitely larger than the innumerable smaller mosques that fill the city, and any one of these alone would make the city notable.

The Mosque of Bayezid.

The first mosque to be built in Constantinople was erected by Mohammed the Conqueror himself; but it was destroyed by an earthquake and rebuilt at a later date, and no record of its original design remains. The earliest existing great mosque was built by Bayezid II. in 1497-1515. This is one of the smallest of the imperial mosques, the forecourt and mosque forming a double square on plan, which measures 268ft. by 135ft. The forecourt is surrounded by a cloister six bays square, each bay being defined by pointed arches set on columns and

INTERIOR OF THE SULEIMANIYEH.

covered with a cupola set on pendentives. The mosque itself is set out as an exact square, 120ft. gins. across internally, and the four central piers are so placed as to include two of the four equal bays of the aisles, these bays being covered with cupolas on pendentives. The dome is carried on pendentives which close round the great arches, and at the base it is pierced with a ring of windows after the manner of Santa Sophia.

But the crux of the whole design was the management of the semidomes. It has already been said that the Mohammedan architect seems to have felt the apses and exedrae of Santa Sophia to be obstructive, and he solved the difficulty by making them an affair of vaulting only.

In this case the semidomes of the exedrae are altogether omitted, and the great semidome is carried on simple pendentives, so that it is a repetition of half the central dome. This mosque is of special interest on account of an unusual development at the west end. The western aisle is extended on each side by additional wings, so that an uninterrupted vista, 272ft. in length, is obtained. Each wing is divided into three bays and covered with five cupolas, their supporting arches being carried on other arches in a most astonishing and characteristically Oriental way.

On the ground plan of all these mosques there is no sign of the complex domical forms which are so conspicuous externally, and the whole of them are ingeniously carried on arches.

The features of the exterior almost repeat the forms of the interior. The four great piers beneath the dome are marked by circular turrets, and the two minarets rise clear from the buildings below, a twin and slender contrast to the broad curved masses of the mosque.

The Mosque of Shah-Zadeh.

The next great mosque—that of Shah-Zadeh—was built by Sultan Suleiman I., the Magnificent, in 1543-48. It exhibits several changes which ultimately became embodied in the traditions of mosque-building. Its architect was an Armenian named Sinan, and he seems to have gathered together the vague tendencies of his day, stamping them with his personality and setting the standard

ENTRANCE TO THE SULEIMANIYEH.

which henceforward guided the design of Turkish mosques. He may well be compared with such a man as Bramante in Italy or Inigo Jones in England.

The Shah-Zadeh Mosque is of medium size, measuring 145ft. by 166ft., while the forecourt measures 133ft. by 117ft., giving a total length of 278ft. The forecourt is surrounded by a cloister of unusually large bays, each being 28ft. square; and the north and south arcades have deep wall-arches with projecting piers.

Three Innovations.

The mosque itself is set out in the exact form of a square, and there are three principal innovations to be noticed. The first is that the application of semidomes is no longer confined to the east and west sides of the central dome. All the four sides are treated exactly alike in this respect, and the expression of length given by the north and south arcades in the previous mosque, and reminiscent of the Christian Church, is exchanged for a more central and perhaps more logical emphasis of the great dome. Although, as compared with the Bayezid

and the greater height of the dome, and, with the Oriental dislike of projection, or in the desire of utilizing the whole extent of building, the spaces between the buttresses were filled with arcaded galleries. These were partly used as porticos, and they became a permanent feature in later mosques and an important factor in the external aspect of the façades.

The Suleimaniyeh.

In 1550 Sinan began the building of the third great mosque of Suleiman I., which is called the Suleimaniyeh after him, and which, in point of size and natural position, dominates almost all Constantinople. This mosque is 227ft. in width and 203ft. in length, and, with the forecourt, makes up a total length of 359ft. It is interesting to compare the size of this, the largest of the Turkish mosques, with the church of Santa Sophia, its prototype. The church is 237ft. wide and 291ft. long, its total length, including the original forecourt, being about 444ft. Thus, while appreciably smaller than the church, the mosque is, nevertheless, on a most magnificent scale. The diameter of the dome

Externally the grouping is less compact than in the previous mosques. The great arches beneath the dome had always been sustained by internal buttresses passing over the aisles, but here, probably on account of the great scale, they project above the roofs and add a further complication to the already complex formation of cupolas and domes. A novelty is introduced in the great pent-roof which projects over the external galleries (see preceding page). Its purpose is to shelter the faithful while performing their ablutions at the series of fountains below, and it was generally adopted afterwards. For the first time, also, four minarets were erected—two in their usual position at the junction of the mosque and forecourt, and the other two, of less height, at the western angles of the forecourt.

The Mosque of Ahmed.

The next great mosque was built by Ahmed I. in 1609-14, facing the ancient Hippodrome and close to Santa Sophia. In scale it is almost equal to the Suleiman Mosque, measuring 214ft. by 364ft.; and the forecourt is the largest in Constantinople,

GENERAL VIEW OF THE SULEIMANIYEH.

Mosque, the actual floor space is only increased by the omission of two columns, yet the æsthetic restriction of the north and south tympanum walls was removed, and the whole interior filled with a wonderful sense of expansion.

The second point of originality lay in the introduction of subsidiary semidomes in the bases of the great semidomes. The complete domical scheme of the apses of Santa Sophia was thus reproduced, although entirely supported on arches and not indicated in any way on the ground plan. A difficulty arises in fitting the curves of the lesser semidomes within the rectangular lines of the lower plan, and to this was probably due the simpler form of the earlier Bayezid Mosque. This difficulty was solved in the Shah-Zadeh Mosque by playing back the main piers so as to give room behind the great arches for the full development of the lesser semidomes, and some such device was generally adopted afterwards.

The third point of fresh development was the extension of buttresses on the north and south sides of the mosque. This was rendered necessary by the increased scale of building

is 85ft. 4ins. as compared with 101ft. 8ins. in Santa Sophia.

The mosque itself in some degree indicates a reversion to an earlier type, for only the east and west sides of the dome have semidomes applied to them, while the north and south sides are filled with arcades bearing tympanum walls. Mr. Reynolds said he could find no reason for this reversion in the mosque itself, and was inclined to surmise that some reactionary influence may have been brought to bear on the architect, Sinan, similar to that which compelled Wren to build St. Paul's Cathedral on the Gothic plan.

The arrangement of the dome and the east and west semidomes, with the lesser semidomes, is similar to that of the Mosque Shah-Zadeh. The north and south aisles under the dome are divided into three bays, and these are grouped in a novel and somewhat curious manner, the central bay being larger than the other two. This setting-out has the result of putting several of the arches out of centre with the cupolas which they carry, and the effect is not altogether satisfactory.

for its width includes the external galleries of the mosque. The mosque itself represents the highest development of Turkish planning, for not only are semidomes applied to all four sides of the central dome, and not only are subsidiary semidomes applied to all of them, but also in three cases the number of the lesser semidomes is three instead of the usual two. In previous mosques the third subsidiary semidome was represented merely by a wall-arch, but here the greater internal depth of the buttresses allows its full development; and further, this internal depth of abutment is articulated with piers and arches. Altogether, the mosque is covered with twenty domical forms, besides various barrel-vaults, and the interior is filled with the interest of their curving modulation up to the central dome. The four piers under the dome are gigantic fluted columns 18ft. in diameter, and built of masonry; but the circular form looks somewhat weak and lacking in rigidity, notwithstanding its enormous size. Another striking feature of the interior is the great number of windows; fifty are shown on the ground plan alone, but, together with those in the upper walls,

the cupolas and domes, there are over 300 windows in all to light this one vast chamber.

The exuberant expansion of design permeates the whole building, and not four, but six, minarets rise around the mosque, emphasizing and relieving its domed mass by their own slender height. There are few Moham-medan mosques with more than four minarets, and the erection of these six led to a charge against the Sultan of wishing to vie with the Holy Mosque at Mecca.

The Yeni Valideh Jami.

In 1615 a mosque was commenced by the wife of Ahmed I., and, remaining unfinished, was completed fifty years later. This mosque, the Yeni Valideh Jami, differs from other mosques in situation, for it is not raised on an eminence apart, but is built on the shore of the Golden Horn, and surrounded by the business of a market-place. Although of comparatively small size, its dimensions are still very respectable. The width of the mosque is 156ft., while the total length, including the forecourt, is 272ft. The fore-court is of the normal type, entered by three doorways and surrounded by the cloister covered with cupolas. The mosque has semidomes on all four sides of the main dome, and each of these has two subsidiary semidomes, except at the west, where the design of the Ahmed Mosque is recalled by three subsidiary semidomes. The external porticos and galleries and the position of the two minarets follow the arrangement of previous mosques, which had now become a settled tradition.

The main dome, of 53ft. 6ins. internal diameter, is carried by four great arches 7ft. 7ins. wide, and its circular plan is produced by simple pendentives. A deep cornice of stalactite corbelling is set above the pendentives, and its projection forms a gallery around the base of the dome. Earlier domes usually spring with a slightly-tilted curve immediately above the pendentives, having a range of windows and buttresses at the base. Here, however, the dome is raised on a definite drum, and the windows and buttresses are applied to it instead of to the dome. The builders seem to have been aiming at a greater effect of space and height.

Dome Construction.

The drum of the dome is built of brick, plastered internally, and with its external buttresses covered with heavy sheets of cast-lead. The dome itself is also covered with

THE YENI VALIDEH JAMI.

lead externally, while internally its material is concealed beneath a coating of plaster or repeated whitewashing; but it is doubtless also constructed of brick. The pendentives of the dome and its four great arches are built of stone. The semi-domes are covered externally and internally as the dome, and are probably built of brick, while their

subsidiary apses and pendentives are of stone. Brick was obviously used for the sake of its lightness and adaptability.

Mr. Reynolds said he could have wished to throw some light on the construction of domes such as this, and also on its relation to the construction of Byzantine domes, but he regretted to be able only to give a little definite information. In the earlier domes the springing of the curve is considerably below the top of the buttresses, so that some of its possible thrust is absorbed by them; and, moreover, certain additional flying buttresses point to this intention. But in this mosque the curve of the dome springs from the top of a drum and above the buttresses, so that the principle of abutting any thrust is put out of the question. The only alternative is to regard the dome as constructed in such a way as to have no thrust, but whether this is effected by means of a system of bonding-stones or chains, or by some adjustment of the jointing, Mr. Reynolds offered no opinion. Constant familiarity with domical construction has given Oriental builders certain methods which, to our inexpert timidity, seem almost impossible, and these methods become the more mysterious and tantalising in that they are practically inaccessible to investigation.

Windows.

One of the most striking features of these mosques is the great number of their windows. All of them are small and of about the same size, and they are filled with roundels of glass embedded in plates of plaster tracery. This principle of minutely subdividing the lighting areas is characteristic of the East, and is due to the need of tempering the dazzling sunlight; and the preference, for a large number of small

THE MOSQUE OF AHMED.

windows, scattered more or less equally throughout the building, completes the same idea on a larger scale.

Masonry.

The masonry is built of white limestone in fairly large blocks. The courses are more or less continuous, and vary considerably in depth, and the joints are fine. Marble is introduced in the porticos and galleries, and discs of green and red marbles are inserted here and there in the masonry, and the voussours or the arches are alternately pink and white.

The Decline of Mosque Building.

By the end of the seventeenth century the Turkish Empire had passed the meridian of its power, and the subtle relation between politics and art was reflected in a decline in energy and taste of building. For more than a hundred years no great mosque was built, and the Mosque of Sultan Osman, erected in 1748-55, shows the first signs of Western influence, a taint of the Rococco Renaissance. The scale of building is smaller than in any of the previous imperial mosques, and the plan is treated with a certain freedom which shows an effort after novelty. The forecourt is of a unique shape, the western bays being set out on a semi-decagonal form. The several bays are covered with the usual cupolas on pendentives, and the interspaces are covered with barrel-vaults. The mosque itself consists of a single great dome set on pendentives, and the most remarkable point of construction is the way in which these are carried. The weight is not taken by the solid walls, but by four great arches, which spring from piers at the angles of the mosque, the walls themselves becoming mere filling. At first sight it would appear that the arches are merely decorative, and that the walls take much of the direct weight, after all; but the tympana are so pierced with windows that there is little strength of masonry left. The arches evidently take the weight of the dome, and they depend on the remarkably slight abutment of the angle piers. The dome is of light construction, and the piers are weighted with turrets, but the design is certainly very daring; and the dome, with an internal diameter of 8 ft. 6 ins., is no plaything, being the second largest Turkish dome in Constantinople. Although the construction is still distinctively Turkish, the decoration has become an extraordinary Saracenic version of the Rococco Renaissance. Mouldings are freely used, and often with very refined profiles; but the walls of the forecourt and the interior are frittered with pilasters, and the fine simplicity of typical Turkish work has been almost altogether lost.

The original mosque of Mohammed the Conqueror, the first to be built in Constantinople, had been shaken by the earthquakes of 300 years, and, in 1768, its almost entire rebuilding became necessary. The new mosque has little relation to the original design, for it follows the fully-developed model of the Ahmed Mosque. The scale is still very great, but the forms are tainted with the Rococco corruption. Turkish art was fast declining in its course, and was now moving only by the force of its fall.

Minarets.

The minarets give more character to the mosques and to the whole city of Constantinople than any other single feature. No mosque was virtually complete without a minaret, but the desire for increased magnificence soon multiplied their number. Their primary use was to elevate the "mueddin," who summoned the faithful to prayer, so that his voice might be heard above the surrounding roofs, but the minarets grew quickly beyond this first necessity, and if the "mueddin" were to chant his call from the upper balconies of later minarets, his voice would be almost lost in the clouds. The minarets are also used for illumination, and on the nights of the great religious

festivals their balconies glitter with thousands of lamps all over the city. The minarets of the Yeni Valideh Mosque rise to about 240 ft. above the ground, but several in Constantinople must be considerably over 300 ft. in height. The roofs are steeply conical, framed with wood and covered with lead, and terminated with a finial bearing the crescent. The smaller minarets have two balconies, and none have more than three. The design of all the minarets is practically identical, the shafts being polygonal and slightly reduced in diameter above each balcony. It has been said that Turkish minarets are the ugliest form of a singularly beautiful feature; but they may claim to have that relative fitness which is the greater part of beauty. Although in themselves they may lack the rich outline of Cairene minarets, yet Cairene mosques have not that complexity of cupola and dome to which the severer elegance of the Turkish minaret acts as a necessary foil.

Internal Decoration.

Many of the mosques have lost much of their original splendour, and are now largely decorated with nothing more elaborate than whitewash. But even this harmless treatment is better than the horrible mixture of corrupt Saracenic and Rococco painting with which the modern Turk has desecrated some of the mosques. One great mosque, however—the Ahmed—has entirely retained its original painting, although restored to some extent. The upper parts of the walls are covered with diaper patterns of conventional foliage and flowers, and the arches and domes are bordered with running designs and set with foliated discs at the crowns. The pattern is applied on a white ground, and the colours are chiefly blues and greens, brightened here and there with red; and the effect would doubtless be very beautiful if the brightness of the innumerable windows was still tempered by their original tracery. But modern glazing has here done its worst, and in the excessive light the gaiety of colour appears tawdry and even vulgar.

The Original Tilework

often remains on the lower parts of the walls. The earlier tiles are of a rich azure blue laid on a white ground, or conversely treated, and geometrical shapes or foliage with pomegranate flowers are the principal decorative motives. The fertility of design is amazing and the combination of different effects most ingenious, while the prevailing blue and white gleams here and there with most effective touches of emerald green and red. A wider range of colour and pattern was used in later tiles, but with the widening of resource came a tendency to over elaboration and ineffective cleverness. The tiles are fairly large, and the pattern seems to have been painted on large slabs, afterwards cut up for the process of firing, for the joints often have no relation to the design. The tiles were imported and their designs were obviously inspired by Persian influence. Such tiles were used for the partial decoration of the greater mosques, and especially for the enrichment of the Mecca niche, but the interiors of the smaller mosques and the *turbahs* or tombs were sometimes thus decorated completely. The mosque of Rustem Pacha is one of the finest earlier instances of this treatment, and the *turbah* of the Shah-Zadeh Mosque is a good example of the later work.

Oriental Method of Decoration.

The essentially Oriental method of decoration is the application of colour to the flat constructive surfaces, and is opposed in principle to the Western method of light and shade by relief. Santa Sophia is a pre-eminent instance of this Oriental method, and its marble plating and mosaic were represented in the Turkish mosques by tilework and painted decoration. Hence, carving (always in marble) was comparatively unimportant.

It was chiefly used for the enrichment the ritual fittings, and was rarely applied the main structure except in the form of stalactite work.

Stalactite Work

may be defined as a horizontal and vertical series of arches, those of each course springing from the apices of those below, so that the general surface advances by degrees; but the original scale of the arches was gradually reduced until they became a mere sculpture-mimicry, no longer arcuated, but corbelled in construction. This freedom from structural limitation allowed a complication of plan form and grouping which defies description, and sometimes almost defies analysis, and the later stalactite work may be regarded as the *tour-de-force* of that mathematical ingenuity which has always distinguished the Oriental mind.

Unlike Byzantine building, Byzantine decoration seems to have exercised no direct influence on Turkish art, and its decoration remained purely Saracenic until the final corruption with Rococco trivialities.

Fountains.

The greatest richness of carving was lavished on the pulpits.

Another feature especially selected for enrichment of carving was the fountain in the forecourt, mainly, no doubt, because of its ritual significance. The earlier fountains were often shaded by a pent-roof supported on shafts; but the single fountain was soon found inadequate, and later mosques have long ranges of washing-places under the external galleries, the fountains in the forecourt being retained as cisterns. These later fountains are usually octagonal, with engaged shafts at the angles carrying arches, and with the interspaces filled with bronze or marble grilles. The cistern is enclosed within this octagonal arcade, an outlet for the water being pierced through each side, the whole being crowned by a crested stalactite cornice and covered with a cupola.

Discussion.

Mr. R. Phené Spiers, in proposing a vote of thanks to Mr. Reynolds, mentioned that nearly forty years had passed since he visited Constantinople. He then had great difficulty in obtaining drawings, but was fortunate to be able to get into Santa Sophia for three days as assistant to the Sultan's photographer. It was the form of this building, so often copied, which gave to the Turkish mosques as a whole a grandeur both externally and internally which the architecture in detail would not afford.

Mr. A. E. Henderson seconded the vote of thanks. He said the poorness of the later decoration in the mosques was due to the fact that the decorator was generally a Greek of low taste. The Moslem, by his religion, was also prohibited from having any representation of life, the only forms used being foliage and geometrical pattern; hence the tameness of the design. The small windows were far preferable to large ones, as they kept out the heat better, and in the winter the air was not so easily chilled as it would be with a large surface of glass.

Mr. J. B. Fulton supported the vote of thanks, remarking that they ought to know more about Turkish architecture, as it was carried on in the Byzantine style, undoubtedly the finest the world had produced. They had seen this style adapted to modern requirements in this country, but the result achieved was not equal to what the Turks had done. Turkish decoration had been a revelation to him. He had studied all kinds of floral decoration, including the "New Art," but in Turkey his eyes were opened to a new treatment altogether. He did not say the designers always reached the height of beauty, but still there was very much to learn from Turkish decoration.

The chairman also spoke, and Mr. Reynolds briefly replied.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics* :—

One-storey shops in front of Nos. 431 and 433, Edgware Road, Paddington, on the further application of Gardner & Theobald, on behalf of Matthews & Sons, Ltd. (*Refusal.*)

One-storey shops in front of Nos. 435 and 437, Edgware Road, Paddington, on the further application of Gardner & Theobald, on behalf of Meux's Brewery Co., Ltd. (*Refusal.*)

One-storey shops in front of Nos. 439 to 451 (odd numbers only), Edgware Road, Paddington, to abut also upon Maidia Hill West, on the further application of Boehmer & Gibbs, on behalf of W. Hirsch. (*Refusal.*)

New streets for carriage traffic, the widening of existing streets, and in connection therewith the erection of buildings upon the estate of the Cadogan and Hans Place Estate (No. 3), Ltd., on the south-eastern side of Fulham Road and the south-eastern and north-western sides of Cadogan Street, Chelsea, further application of Bouchier, Burmester & Galsworthy, on behalf of the Cadogan and Hans Place Estate (No. 3), Ltd. (*Consent.*)

Buildings on the northern side of Coddington Hill, Brockley, on the application of J. W. Webb. (*Consent.*)

An addition to an iron and glass shelter at the entrance to the Royal Theatre, Nos. 73 and 74, Dean Street, Soho, on the application of Smee & Cobay, on behalf of K. Santley. (*Consent.*)

An iron and glass shelter in front of the Prince's Theatre, East India Dock Road, Poplar, on the further application of Owen & Ward, on behalf of C. Soumes. (*Consent.*)

Buildings upon a site abutting upon the western side of Chatham Place and southern side of Belsham Street, Hackney, on the further application of Hodson & Whitehead, on behalf of Hodson & Rowlandson. (*Consent.*)

House on the northern side of Church Lane, Tooting, to abut upon the western side of Moring Road, on the application of Nash & Lillywhite, on behalf of J. S. Trotter. (*Consent.*)

An addition at the side of the porch at No. 5, Oppidans Road, Primrose Hill, Hampstead, on the application of W. E. Sanders, on behalf of C. Braby. (*Consent.*)

Retention of a projecting hood to a cottage at the rear of No. 69, Clapton Common, Hackney, abutting upon Braydon Road, on the application of A. C. Jackson. (*Consent.*)

Retention of projecting signs at No. 151, Englefield Road, Islington, on the application of A. Grahnam. (*Consent.*)

Retention of a greenhouse at the rear of No. 66, Sotheby Road, Islington, southward of No. 64, on the application of A. Mitchell Torrance, on behalf of H. C. Harris. (*Consent.*)

Porch to a house on the eastern side of Kersfield Road, Wandsworth, on the application of A. Williams. (*Consent.*)

One-storey shop as an addition to No. 54, High Street, Tooting, on the application of S. S. Dottridge, on behalf of E. Dottridge. (*Consent.*)

Projecting shop front with cornice and wooden trusses at No. 105, Church Street, St. Marylebone, on the application of W. R. Phillips, on behalf of W. Prested. (*Refusal.*)

Iron and glass porch at No. 54, Glenlock Road, Hampstead, abutting upon Glenilla Road, on the application of H. Edgerton. (*Refusal.*)

One-storey shop on land adjoining the Catholic Apostolic Church, Gordon House Road, St. Pancras, on the application of S. E. Spencer. (*Refusal.*)

A wood and glass showcase to No. 224, Regent Street, to abut upon Argyll Place, on the application of F. Sage & Co., Ltd., on behalf of T. & J. Perry. (*Refusal.*)

Building (University College Hospital, Medical School and Nurses' Home) on a site abutting upon Gower Street, University Street and Huntley Street, St. Pancras, on the application of Paul Waterhouse. (*Consent.*)

Re-erection of Nos. 48 and 49, Jernyn Street, St. James's, with balconies, on the further application of W. Woodward, on behalf of S. T. Miller. (*Consent.*)

Deviation from the plan approved on June 5th, 1905, for the erection of a building on a site abutting upon the west side of Mare Street, and north side of London Lane, Hackney, so far as relates to an increase in the height of the building, on the application of C. G. Smith, on behalf of W. Fritin. (*Consent.*)

New street for carriage traffic upon the Sanders estate, to lead from Denmark Hill to Dumbleton Road, Lambeth, on the application of R. Ellis & Son, on behalf of A. A. Sanders. (*Consent.*)

Adaptation as a street for foot traffic only of a way known as "Reuben Street," out of the east side of Brady Street, Bethnal Green, on the application of A. P. Stokes, on behalf of E. Seward and R. W. Seward. (*Refusal.*)

Retention of the engineer's cottage at the Grove Hospital on the north side of Blackshaw Road, Tooting, with the forecourt boundary fence at less than the prescribed distance from the centre of the roadway of the street, on the application of W. T. Hatch, on behalf of the Metropolitan Asylums Board. (*Consent.*)

Buildings with projecting oriel windows and balconies, on a site abutting upon the west side of Kingsway, and upon the sites of No. 3, Great Queen Street, and No. 64, Parker Street, Strand, on the application of A. Sykes, on behalf of O. Owen. (*Consent.*)

A modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of buildings on the west side of Streatham Hill, at the corner of Drewstead Road, Wandsworth, with an irregular open space at the rear and

portions of the buildings, extending above the diagonal line, on the further application of Taylor & Sons. (*Refusal.*)

A deviation from the plans approved on 6th December, 1904, for the erection of a building on the site of Nos. 36 and 36A, St. James's Street, and No. 64, Jernyn Street, St. James's, so far as relates to the substitution of one air duct for two air ducts, on the application of W. Woodward, on behalf of L. Thomas. (*Consent.*)

Retention of hoardings at the ends of Elborough Street, Southfields, Wandsworth, on the application of Palmer & James. (*Consent.*)

An extension of the period within which the erection of bay windows and a porch to No. 52, Priory Road, South Lambeth, was required to be commenced and completed, on the application of F. Hingston. (*Consent.*)

Bay windows and pent-roofs to fourteen dwelling-houses on the western side of Wallingford Avenue, St. Quentin Avenue, North Kensington, on the application of Trant, Brown & Humphreys. (*Consent.*)

One-storey shops on part of the forecourts of Nos. 29 & 31, Beacon Road, Hither Green, Lewisham, on the further application of H. Kent. (*Consent.*)

Re-erection of No. 26, Vaughan Road, Lambeth, on the application of G. G. Rogers, on behalf of H. G. Westcott. (*Consent.*)

A building at the rear of No. 132, Arnkask Road, Catford, to abut upon Torridon Road, on the application of H. Lewis-Upham, on behalf of H. Bown. (*Refusal.*)

One storey shop on part of the forecourt of No. 408, Merton Road, Southfields, Wandsworth, to abut also upon Lavenham Road, on the application of T. Aldred, on behalf of W. G. Davey. (*Refusal.*)

One-storey shop in front of No. 79, Victoria Street, Westminster, on the application of Griffin & Woollard, on behalf of H. Webley. (*Refusal.*)

Retention of a building at "Northcourt," Hampstead, with the forecourt boundary fence at less than the prescribed distance from the centre of the roadway of College Villas Road, on the application of Hudson & Hunt, on behalf of W. Scoot. (*Consent.*)

Addition to Nos. 10 and 11, Hop Gardens, St. Martin's Lane, Strand, with external walls at less than the prescribed distance from the centre of the roadway of Hop Gardens, on the application of George Trollope & Sons and Colls & Sons, Ltd., on behalf of Johnson, Matthey & Co. (*Consent.*)

The Theatres and Music Halls Committee reported having considered the following :—

A plan and specification, submitted by the town clerk of the Metropolitan Borough of Battersea, of a portable wood and canvas proscenium front and box scene proposed to be erected at the Battersea Town Hall. (The Committee was unable to recommend the Council to allow the erection of wood and canvas proscenium front, even though treated with a fire-resisting solution.)

Plans submitted by W. G. R. Sprague, on behalf of Seymour Hicks, showing the arrangements proposed to be adopted in the construction of a new theatre in Shaftesbury Avenue, with entrances to Wardour Street and Little Rupert Street. Accommodation is shown for an audience of 1,172 persons seated and 130 standing. (*Approval.*)

Plans, submitted by F. H. Payne and Bull & Bull, showing the arrangements proposed to be adopted in connection with the annexe at Olympia, Hammersmith, during the time the premises are used as a winter sports club. (*Refusal.*)

A plan, submitted by Emley & Sons, Limited, showing the proposed formation of a doorway between the engine-room and the heating chamber and the provision of a radiator in the passage-way near the stage entrance at the Princess of Wales's Theatre, Kennington Park Road. (*Approval.*)

A plan submitted by F. Matcham & Co., showing a proposal to place a low-pressure hot-water warming radiator in the vestibule at the Royal Music Hall, Holborn. (*Approval.*)

Plans submitted by E. Stephens, showing a proposal to form an opening 4ft. 6ins. wide in the back wall of the concert hall at the Royal Victor Hotel, 234, Old Ford Road, Bethnal Green, to provide communication between the concert hall and the part of the public-house premises adjoining, which will be used as a cafe. The formation of the proposed opening would bring the concert hall into the fire risk of the public-house, and the Committee do not consider that this should be permitted.

OUR PLATES.

IT is our practice occasionally to give some representative examples of current work in America, where the public buildings—libraries especially—are designed on a scale and with a sense of good proportion not often seen here. In that respect American architects owe much to French training, but as regards their house architecture quite other models are followed. From the four examples of new houses in Boston which we publish as a centre plate this week, it will be seen that old English types of Georgian and later days are adopted. The front designed by Mr. A. J. Manning is carried out in marble, and the decoration, presumably in small pieces, across the large bay window, over the doorway, and under the cornice, must be very delicate in effect. Of the other three designs there is nothing in particular to say: they speak for themselves, being straightforward pieces of brickwork with ornament sparsely applied: and though some persons may

think it incongruous for modern Americans to take up such an old thread, it will not be denied that the results are very successful, the houses being designed in a way which is far more pleasing than the generality of work which claims to be essentially and only of to-day.

ARCHITECTURAL ASSOCIATION.

THE following new members were elected at last Friday's meeting of the Architectural Association :—Messrs. Paul Faraday, P. R. Fincher, K. Dalglish, C. W. Long, H. W. Spark, T. C. Black, C. G. C. Payne, H. Griffin, junr., Harold Sudlow, F. C. Barrow, A. G. Taylor and Flint Browne.

The following further donations to the Building Fund were announced :—

	£	s.	d.
Charles Wall, Ltd.	-	-	25 0
E. R. Nixey	-	-	2 0
F. A. Forster (double subscription)	-	-	1 0

A. Dunbar Smith	do.	-	0 10 6
W. Charles Waymouth	do.	-	0 10 6

SOME IMPORTANT STONE QUARRIES.

AT a meeting of the Society of Engineers held on Monday evening (Mr. Maurice Wilson, vice-president, in the chair) a paper was read on "The Grindleford Stone Quarries and their Working" by Mr. Benjamin L. Bradley.

These quarries are a section of the undertaking which is being carried out by the Derwent Valley Water Board for increasing the supply of water to Nottingham, Sheffield, Derby and Leicester, and which will ultimately cost between six and seven millions. The quarries supply the stone for building the dams, and are 52 acres in extent. They are situate about 10 miles from Sheffield. Their geological formation is one of the millstone grits of the carboniferous system, known as the Rivelin. The approximate quantity of good building stone is 2,400,000 tons. The quarries were opened in April, 1902, and the first consignment of stone was despatched to the dams in June, 1903.

The quarries are connected up with the Midland railway, and owing to the high altitude of the working faces (about 500ft.) above that line an incline rope-hauling cableway 750ft. long, and a zig-zag railway, were found necessary.

The haulage is effected by means of a 15ft. diameter winding drum, with two 1½in. wire ropes having hemp cores, the breaking strain on each of which is 80 tons, with a factor of safety of 8.

Owing to a change of level (about 300ft.) in the beds the quarries have to be worked at three different lifts. When the blocks of stone range from 100 to 400 tons each, they are pushed off their beds with screw-jacks. Blocks of less than 100 tons each are split into blocks of about 30 tons each, and pulled off after cleavage by cranes. The explosives used are gelignite and blasting powder.

Obituary.

Mr. George Langmaid, builder, of Liskeard, died last week, aged 78.

Mr. John Weller, who was one of the oldest architects practising in Wolverhampton, died recently.

Colonel Eaton, F.R.I.B.A., C.B., head of the firm of Eaton & Sons, architects, of Ashton-under-Lyne, died on November 26th. He studied architecture in the office of his father and in that of Mr. Moffatt, in Manchester.

CORYVILLE.

A Garden City near Cardiff.

WE illustrate on this page the scheme for "Coryville," the garden city which is proposed to be laid out on an area of about 200 acres on the Duffryn Estate at Peterston, near Cardiff, by Mr. John Cory, J.P.

The architect in charge of the work is Mr. W. Beddoe Rees, A.R.I.B.A., of Cardiff.

The site is surrounded on three sides by low hills and thickly-wooded slopes, which shelter it from the winds, while the fourth side is bounded by the River Ely, which is a striking feature of the scheme, as a considerable amount of money is to be spent in forming an embankment and making the river suitable for bathing, boating, fishing, &c.

The plan of the village is circular. In the centre will be a large green surrounded by shops, which will form the business centre, and no other shops will be allowed on any part of the estate. From this centre five avenues radiate, communicating with the Grand Avenue and the outer circles. The Grand Avenue will be about 60ft. wide. Around this will be the better-class houses, either detached or semi-detached, each on its own piece of ground, about a quarter or one-sixth of an acre in extent, so that each house will have ground enough for a tennis court and a kitchen garden. The second avenue will be devoted principally to the smaller houses and cottages, varying in cost from £200 upwards. These again will be chiefly detached or semi-detached, but on no account will a group of more than four be allowed together. As soon as all the plots are let another circle will be laid out, and the scheme enlarged as occasion demands.

The sewage treatment is to be on the septic tank principle, and the cost of it will be borne entirely by Mr. Cory, nothing being charged to intending tenants. There will be an ample supply of pure spring water, and each house will be connected by a separate main, for which there will be a small charge according to the water consumed. As to lighting, nothing is definitely settled yet, the respective advantages of gas and electricity being at present under consideration; it is probable, however, that gas will be adopted, though a small electric plant will also be laid down should the demand be sufficient. With respect to

Ground Rents,

Mr. Cory is desirous of charging an amount which will show a fair return on the money expended, but it will be made as low as possible; we think we are safe in saying that it will be fully 50 per cent. less than the ground rents in other suburbs of Cardiff. In addition to laying-out the streets, planting them with rows of trees, providing the necessary drainage, and paying all other general expenses, Mr. Cory is prepared to offer every inducement to intending tenants, especially those who through adverse circumstances are at present unable to enjoy the benefits of a country home. A scheme is being prepared by which 80 or 85 per cent. of the money to build a house will be provided on security of the lease, and thus small holders will be able to occupy their own houses. This, worked out carefully, shows that if a man has £30 or £40 he can benefit by the scheme to such an extent that he can erect his own house with the money provided by the scheme which is at present being formulated. After allowing for the interest, paying back the capital, and a season ticket into Cardiff, the cost would total as nearly as possible what he is at present paying in rent only.

A limit will be placed on the amount of ground to be let, as it will be naturally unfair to let one person have an acre, and crowd out those who are really more in need of the benefits offered. Probably one-twelfth of an acre will be the minimum and one-quarter of an acre the maximum. Provision is being

made for recreation grounds, open spaces, a small park, &c., which, if the plots are taken up, Mr. Cory will lay out himself. A space is also to be reserved for churches or chapels and public buildings, such as a school, village hall and gymnasium, reading-room, lecture hall, and everything necessary for the instruction and betterment of the tenants. It is also proposed to erect a small unlicensed village inn, while sites for factories will be

available. But with regard to the erection of the houses Mr. Cory intends to leave this to the tenants themselves. The ground will be let on leases of ninety-nine years, and it will be for the lessee to erect a house according to his own requirements, though every help will be given by way of financial assistance. A prospectus of the scheme is being prepared, and will shortly be issued, giving plans and details.

"CORYVILLE," THE PROPOSED GARDEN CITY AT PETERSTON, NEAR CARDIFF. W. BEDDOE REES A.R.I.B.A., ARCHITECT.

Views and Reviews.

The New Architectural History.

This is the first of a series of volumes dealing with architectural history and practice which Messrs. Longmans, Green & Co. propose to publish under the editorship of Prof. F. M. Simpson, of University College, London. The series is well begun with this volume from the pen of the editor. By an advertisement in the book we see that he will follow the present volume on "Ancient, Early Christian and Byzantine Architecture" by a second one on "Mediæval" and a third on "Renaissance" architecture; while Prof. Beresford Pite, assisted by other authorities, will contribute two volumes on building construction. We presume that

Faultiness of Existing Histories.

the series is to be called, is intended to summarize and collect information from all sources for the guidance of students; therefore we must not look for anything particularly novel. We fully agree that such a series is needed, because existing books on building construction, architectural history and practice are in many respects unsatisfactory. They are seldom written by competent authorities, more often being contributed by men who are not in such demand that it is difficult for them to find time to write these works. In Professors Simpson and Pite we are fortunate in having two men possessing ability and considerable practical experience, who, by being selected to fill chairs of architecture, are enabled to devote time to this necessary part of architectural education, namely, the production of text-books.

The Need for a Modern History.

A history of architecture more recent and more practical than Fergusson's and fuller than Fletcher's no doubt would fill a place, but unless it were a material improvement we could only regret that it should occupy the market to the exclusion or delay of a really adequate history. For the moment we cannot judge whether Professor Simpson's contribution will be worthy to occupy the vacant place. This present volume is very good in some respects, but in others there is a lack of thoroughness and all-round grasp, due no doubt to the fact that Professor Simpson does not always speak from personal investigation, as indeed he admits in his introduction, having only visited Italy, Sicily, Greece, Turkey and Asia Minor. The beginnings of architecture are to be found in Egypt, Assyria, Persia, India and China. Of course it is almost hopeless to expect one man to have experience of all these countries. There are, unfortunately, no trustworthy authorities who have thoroughly investigated the architecture of these places and published the results so as to enable an historian to collect, correlate, compare and criticize the discoveries and build up an adequate rendering of the beginnings of architecture. There are many theories, it is true, mostly supported by little or no evidence. It requires a trained archaeologist to prepare the way, but failing complete sources of information there is no doubt much to be learnt by an experienced architect who should see what does exist at first hand.

The Scientific Historian.

We have men of scientific training enough nowadays to interpret the art and constructive science of the past better than ever before. A conspicuous example is M. Choisy, whose work upon Roman architecture taught us more than all the architects of the Renaissance had discovered, and even more than a contemporary like Vitruvius could tell us of the work of his time. M. Choisy has recently done a good service in regard to Egyptian architecture, and Professor Petrie is fortunately an archaeologist of sufficient ability to assist in the interpretation of this architecture. The late Mr. F. C. Penrose and

other workers have likewise cleared up later Grecian work, while Viollet-le-Duc set an example in regard to Gothic work. Renaissance work is near enough to our time for all to grasp; but though Egypt, Greece, Rome and the architecture that followed in regular evolution have been fairly well investigated, a beginning has only recently been made in regard to Assyrian and Persian work, while the elucidation of Mycenaean pre-Grecian culture has only within the last year or two been made. The latter, indeed, has gone far enough to show that Grecian architecture evidently derived much from Egypt, although it also contains elements of Assyrian and Babylonian work.

Before Egypt.

It has nowadays become plain that work in Asia, more especially in regard to the decorative elements, sprang from some underlying art culture that preceded even the early Assyrian work which existed several thousand years B.C. From this culture, which has yet to be ascertained, sprang Indian and Chinese work, no doubt. As to whether it emanated from Egypt, or whether Egyptian art (the earliest examples of which apparently go back to 10,000 B.C.) was derived from it, has yet to be proved; while it now becomes a question whether Assyrian culture antedated Egyptian. The early beginnings of civilization are difficult to trace, and until we have more knowledge the beginning of architectural history cannot be completely cleared up.

What Professor Simpson has done.

This only shows the difficulty. Professor Simpson starts a good way on the road, and although he is to a great extent on safe ground we think he might have been somewhat bolder and done somewhat better. In fact, starting so late as he does it is impossible to assign adequate reasons for architectural forms without some reference to early art and constructional need outside Egypt, which he deals with fairly well, and Assyrian and Mycenaean work, with which he deals only scantily.

Professor Simpson treats his subject from the evolutionary standpoint; that is to say, he deals with the history of civilization, knowledge acquired from former civilizations, the needs of the people, wealth and trade, command of labour, the geography of countries, materials and the construction that sprang from them, motives in the design of details, &c.

While his treatment of materials and construction is on the whole satisfactory, we do not think sufficient attention is paid to tradition, to geography and climatic influence, to the temperament of the peoples, their religions and ideals, and the needs of their civilization. Where the author does describe the geography of a country he does not provide

Maps Wanted.

plans, and consequently a clear idea cannot be carried in the student's mind; while if the latter refers to maps of the country as it exists at present, or even maps in ordinary histories, these give no idea of the country as it existed at the time referred to.

The Influence of Religion on Architecture.

The influence of religions and ideals does not need explanation on our part. We only mention it because architects and historians up to the present—and Professor Simpson is no exception—have overlooked the great influence of these on architectural development. A typical instance of what might be done in regard to this, and the conclusions that might be drawn from an intelligent view, is to be found in the late Mr. Ruskin's eloquent chapter on "The Nature of Gothic" in the "Stones of Venice." The architecture of the Egyptian temples and tombs (little else is known) was entirely conditioned by the religion of the Egyptians, and Professor Simpson is only one more author who has been led to an inadequate treatment of the subject by a neglect of this important fact.

The Critical Examination of Plans.

Few historians have ever attempted to critically examine the plans of ancient buildings and point out the needs, elementary or complicated, which they served, and how satisfactorily or unsatisfactorily they did so. It is of course difficult to ascertain this in regard to most ancient buildings, but we can at least seek for near approximations on the more important points in Egyptian and Grecian work, and the buildings succeeding this last civilized era.

In the space at our command it would be impossible to deal with all the matters touched upon by Professor Simpson. His book is an interesting running commentary upon points which have agitated the architectural profession in the past, and will continue to do so. He advances perhaps few new views, but he manages to state ideas very clearly; and although we are often inclined to quarrel with some of his conclusions, they are at least not due to want of thought.

Origin of the Orders.

For instance he disputes the timber origin of the orders of Grecian architecture. It is perhaps well that he should take a partizan view, because the suggested origin has been too readily accepted, but we think there is something in it after all. He seems to argue that if we admit that the Greeks founded their architectural forms upon a timber original, their ability as architects becomes debased. There is no doubt that Grecian work is particularly lithic, but it cannot be expected that the Greeks, more than any other nation, should have been able in the short period which we know it took for the development of their architecture to get away from all the existing types. They may not have been so conservative as to blindly follow tradition (probably were not), but their education must have come from the observance of existing buildings, and their detail shows that they took their knowledge from existing forms of ornament. Some of the work is distinctly suggestive of Egypt, some of Assyria. They went back, it is true, to the foundations of knowledge in many cases, i.e., built their knowledge on experiment and the copying of nature, but they had to take much on trust. The naturalistic tendency just referred to is

found in many climes and many times. We must not always suppose that a form of ornament or a form of construction was always obtained from some previous civilization, because we know that where no communication with outside nations has taken place, such as with savage races upon islands like Australia, New Zealand and smaller islands of the Pacific, the work is often distinctly akin to early decorative forms to be found in such countries as India, Mycenaean Crete and Greece, and China, but it takes a long time for people to advance even a little way at the beginning, although the pace increases as they go on.

A good beginning.

Professor Simpson in this book carries us as far as early Christian and Byzantine architecture, and it will be interesting to read his other volumes. The book is a serviceable introduction for any student, and it is compiled in a way that will teach him to think, which, after all, is the chief thing. The illustrations are clear, but they are not so numerous as they might be; moreover, they are small, though not so cramped as often is the case in books on architectural history, so that this volume is superior in that respect. The manner in which Professor Simpson has performed his task is suggestive that when he comes to deal with architecture nearer our time—architecture which he has personally investigated—he will have produced a work of great educative service.

"A History of Architectural Development," Vol. I., by F. M. Simpson. London: Longmans, Green & Co., 39, Paternoster Row, E.C., price 12s. 6d. nett.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Screens.

H. writes: "Please give a list of the figures and their positions on the great screens of Winchester and St. Albans, and some particulars of the one at the Priory of Christ Church, Hants."

A book entitled "The Great Screen of Winchester Cathedral," by G. W. Kitchen, D.D., Dean of Durham, published by Simpkin & Co., Ltd., Stationers' Hall Court, London, will give the information you require upon the Winchester screen. Particulars of the St. Albans and the Christ Church screens will be found in "The Cathedral Church of St. Albans" and "Wimborne and Christchurch" respectively, both by the Rev. Thomas Perkins, M.A., and published by George Bell & Sons, London. All these books are to be found in the library of the R.I.B.A. H. Y. M.

The Theseum, Athens.

WALTHAM ABBEY.—STUDENT writes: "In the Theseum at Athens is the sculptured panel over the angle column as illustrated in Normand and Mauch's parallels of the Orders correctly so placed? On which angle of the temple does it occur, and what is the subject of the panel next to it? I cannot find this illustrated in 'Stuart and Revett,' but hope you may be able to give me the desired information."

The metope sculptures of the Theseum shown in Normand's and in Mauch's "Orders of Architecture" seems to be an invention based upon one of the actual metope sculptures of this temple which is illustrated in Stuart and Revett's "Antiquities of Athens." This sculpture represents Theseus driving the Bull of Marathon into Athens. The correct position of this panel is second from the angle on the south side at the east end. The angle metope represents Theseus destroying the Minotaur. In the Theseum there are eighteen sculptured metopes, ten being on the east end and four on each flank at the south-east and north-east angles. All these metopes are illustrated in the "Antiquities of Athens," Volume III., Chapter I., Plate XIII. H. Y. M.

Water-supply from Wells.

SOUTHPORT.—J. M. writes: "What is the most economical way of getting water from a well 90ft. from the point where it is wanted? The well is about 10ft. deep. At present a hand pump is placed about 10ft. away, and wooden gutters have to be fixed each time it is used."

The most economical plan depends upon the circumstances of a particular case. There are two ways in which the water may easily be delivered at your house:—(1) Substitute a 1½in. galvanized iron pipe for the wooden gutters you have hitherto employed; leave the pump where it is, and put a galvanized iron tank under it to contain the storage for the house. A tap at the lower end will enable you to draw water at any time. (2) Put a pump in the house, lay 1½in. or 1in. pipe to the well, and pump at the lower end. There is no difficulty in making a pump draw that distance as the lift is only 10ft. The latter is the better plan. F. S. I.

Street Frontages.

MOSELEY.—X. writes: "Referring to the reply to my enquiry on p. 286 of your issue for November 15th, I regret to say the point has been missed. The portion coloured red was the intended building, and should have been more clearly defined as such, whereas the whole of the letters A, B, C and D denote existing ones. The query was as to whether the building line should be between the front lines of buildings B and C and be defined by them, or between those of A and D and defined accordingly. The surveyor's contention was that the buildings B and C were not buildings in accordance with the Act referred to, and that the building line should therefore be defined by the buildings A and D. The query might in other words be expressed as follows:—Are the buildings B and C buildings in accordance with section 3 of the Public Health (Buildings in Streets) Act, 1888?"

The Public Health (Buildings in Streets) Act, 1888, section 3, distinctly says "house or building . . . or any part of such house or building" shall form the frontage line. There is no doubt that the buildings B and C form the frontage line between them. Are they not "buildings" in the sense that if proposed to be erected now they would be under the by-laws; and so, by the same rule, are they buildings capable of defining the frontage line? F. S. I.

Book on Stone-working Machinery.

FRITH.—G. J. B. writes: "Which is the best book on stone-working machinery? I have Powis Bale's, but it is quite antiquated in view of the advance made in this class of machinery during the last seven or eight years. I should like to know if there is a publication of the kind quite up to date. There seems to me to be a great call for such a book."

We believe Mr. Powis Bale's book on stone-working machinery is the only one that has been published. We have never heard of any other. A second edition of it was published a few years ago, in which some additions were made, but the demand is not sufficient at present to enable Mr. Bale to bring it right up to date.

Builders' Agreements.

ARMAGH.—D. P. M. writes: "Please give particulars of the best law book relating to builders, concerning their agreements with architects and owners."

"Building Contracts," by Frank W. Macey, price 15s. post free from our offices.

Removing Grease Spots from Paper.

GILLINGHAM.—H. G. writes: "Can you recommend a satisfactory method of removing grease spots from drawing paper?"

There is no process for removing grease that we know of. The best plan would be to cut the patch out and substitute another.

Gate-posts.

Referring to the enquiry about gate-posts on p. 316 of our issue for last week, Mr. W. A. S. Flitton, of Wellingborough, writes: "It might be of interest to your correspondent to know that six months ago I fitted up eight farm gates with reinforced-concrete posts, and although they have been subjected to some rough usage from carts, ploughing engines, &c., they are as good now as on the day when they were put up, and look like standing for a century. They were made with 1 of cement to 4 of limestone (crusher-run), reinforced with four ¾in. round-iron bars placed vertically one in each corner of the post. The posts are 9ins. square and 6ft. 6ins. high; 4ft. 6ins. above and 2ft. below the ground. All the ironwork, hinges, &c., was put in position while the posts were being made. They are rather heavy, but as they can be made where they are required this is

not disadvantageous. For front gates they could be made in any colour, and no building material lends itself more to artistic treatment than concrete, provided it is not daubed over with a finishing coat to make it appear to be what it is not, i.e., natural stone. The cost of these posts would not be more than half the cost of oak posts."

Mr. Harry Hems, of Exeter, writes: "Your correspondent's remark that it is difficult to get oak for gate-posts, roins, by roins, without sap is a curious confession. No doubt there is comparatively little good English to be obtained in the metropolis, but timber merchants throughout the country have always plenty of it on hand for disposal. Still, failing English, there is a glut of Stettin and Dantzig at all times on the London market, and it takes a clever man to distinguish much of either of these (when worked up) from ordinary English. Both are very cheap, and I have had three truck-loads of Stettin delivered at my yard this very week at 3s. per ft. cube. So far from sap existing in it, I never saw an inch of sap in a Stettin or Dantzig log in my life, and I have handled thousands of them during the last half-century. If your correspondent is careful to well tar the posts below and for a few inches above the ground line, there is little fear of their rotting. I have quite a number of oak piles in my possession that were driven into the Exe by Mayor Gervase in A.D. 1231 to form the foundations of the bridge he built across that river. They remained *in situ* until early in the present year, when they were dug up again, and after remaining 774 years in mud and water are everyone of them now as sound as a bell."

The Lighting of Rooms.

GREAT BOOKHAM.—SUBSCRIBER writes: "Which is the best way to secure the greatest amount of light into a room which is to have a balcony projecting 7ft. in front? The height from verandah floor to under-side of fascia is 8ft. 3ins. Is it possible to make a good job by introducing glass into the lead flat, and how is it best done in order to prevent a drip on under-side of balcony?"

We suggest the use of an ordinary prismatic glass pavement light in the floor of the balcony. Directions for fixing this so as to prevent water dripping through will be given by the makers.

Corrosion of Solder on Ball Valve.

ASHWELL.—B. writes: "Can you give me any explanation and remedy for the solder to a copper ball-valve to a w.c. flushing cistern becoming eaten up and rotten? This has happened twice since the spring, and the solder to the ball itself where it touches the water has perished. The last time I put on an entirely new ball, but this has gone just the same. A hole has also appeared in a small lead pipe which is in the cistern. There is a white deposit on the pipes."

If the cistern be supplied with rainwater, and pigeons kept, it is their droppings that have turned the water into a mild acid, which has set up between the copper of the ball and the zinc in the solder the electro-chemical action of a galvanic battery that has destroyed the solder's nature. The cure for this is to use solder that has no zinc in it; another is to use iron pipes (galvanized ones will soon be ungalvanized). If spring or town-main water be used it may be that the acid for soldering has run or dripped into the cistern in sufficient quantity to make an acid of the first filling of water, and the mineral salts of the water have been strong enough to complete the destruction. In this case great care must be used when soldering. If the water be strongly mineral, the only remedy is copper pipes, with connections either brazed, flanged or screw unions.

O. WHEELER.

Correspondence.

Preston School Competition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Since reading the remarks in your journal in regard to this competition I have seen the designs on view at the Harris Institute, Preston; and although I do not think it probable that any action on the part of competitors will alter the result as regards the award of the premiums or the appointment of the architects for the work, I agree with you that some protest should be made by competitors themselves against the injustice which has been meted out to them in this competition. The award of the premiums to the designs selected (particularly the first and second) is so flagrantly wrong that competitors should readily join in some protest. This I imagine would take the form of a protest to the Corporation, and if so, and as one of the competitors, I should be pleased to sign same.—Yours truly, X.

Cheshire School Competition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—What do you think of this as an instance of cool cheek? Some time ago, in response to an advertisement, I sent in plans for two small schools to be erected by the Cheshire County Education Committee near Macclesfield. After some two months or so I received my plans back. There was no announcement of the result with them—in fact, nothing whatever. This was about three weeks ago, but I have heard nothing further, nor, so far as I can ascertain, has any other competitor. One would think that a county council, spending public money, could at least afford a penny stamp to let one know the result of a competition on which one had expended some weeks of unremunerative labour. Is not this an argument for registration, which, if it does nothing else, may at least raise our status in the public eye a little?—Yours truly,

LIVERPOOL.

ALPHA.

Fire-resisting Wood for Strong-room Shelves.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—We notice in your issue for November 22nd an answer to an enquiry about fire-resisting wood for shelves in strong-rooms. With regard to your statement that "if the interior of a strong-room became hot enough to scorch the wood of the shelves the papers would be burnt," we desire to say that fire-resisting wood is not only far less conductive of heat than ordinary wood, but is an almost perfect non-conductor. Unless the fire or flame be in absolute contact with every part, and continue in such absolute contact, it would not scorch the wood nor materially raise its temperature. Therefore, the security from any damage to documents is so increased that the use of fire-resisting wood for such a purpose is in every way necessary.

If flames were in contact with a piece of our wood, papers well within a foot would not be scorched.

With regard to your second statement that "there is an especial objection to using wood which has been processed because the chemicals are hygroscopic &c.," we feel you are not cognizant of the qualities of wood treated by our process. Our wood is not hygroscopic, nor does it keep damp, nor has it any tendency to absorb moisture so as to make it in any way injurious to paper, parchments or other materials placed upon it.

In justice to ourselves we shall be glad if you will publish these facts.—Yours truly,

FIRE-RESISTING CORPORATION, LTD.

FULHAM.

A. A. WELSH, Secretary.

[In reply to the above we need only say that hitherto there has been a tendency for treated wood to become hygroscopic, as shown by Professor Woolson in the paper which he read before the last International

Fire Congress. In a few instances where treated wood has been employed iron fittings and nails in contact with it have rusted, and trouble has also arisen from this source in connection with casings of electric bell wires. We are glad to hear, however, that the Fire-Resisting Corporation, Ltd., have successfully overcome the defect. Shelves of strong-rooms should not be in contact with walls; but, assuming that they were, fire-resisting wood would certainly be an advantage. If the temperature rose sufficiently to scorch ordinary wood when the shelves were not in contact with the walls, it would scorch the papers also, being nearly equal throughout the room, in which case there would not be any particular advantage in using treated wood.—Ed. B. J.]

The Lettering Nuisance.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In the "Times" of November 24th a letter appeared under the heading "Kingsway and Aldwych" with the object of suggesting generally to corporations and other landlords, public and private, the advantage that would result from the insertion of covenants in the leases of building sites or buildings under their control imposing reasonable restrictions as to advertising displays (including, of course, all lettering and other devices appealing to the eye) on any part of the exterior. Whether the suggestion will prove fruitful depends upon the backing it gets from those who speak with more authority than that of an honorary secretary of a society.

Architects have a particular interest—may I venture to add that they lie under a special obligation?—in the matter. For if the present tendency goes on unchecked, design must become a minor element in determining the aspect of business thoroughfares.

You will remember that some years ago a memorial signed by a number of London architects was presented to the London County Council urging it to obtain powers of control over spectacular advertising in all cases. In this instance it has the power in its own hands.—Yours truly,

RICHARDSON EVANS,

Hon. Secretary,

National Society for Checking the Abuses of Public Advertising.

The T-Square Club.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Allow me to correct an error on page 316 of your issue for last week. The T-square Club is still in existence; in fact, we are holding a general meeting on Thursday, December 14th, at "The Monaco," Piccadilly Circus, at 5.45 p.m. All communications respecting the Club should be addressed to me at 7, Great James Street, Bedford Row, W.C.—Yours truly,

W. H. WEBBER.

Wren's House not Sold.—The fine old mansion in Botolph Lane, Eastcheap, said to have been occupied by Sir Christopher Wren, was put up for sale at Tokenhouse Yard last week, but, nothing higher than £6,750 being offered, was withdrawn.

The Trowbridge and District Joint Isolation Hospital was opened recently. The architect was Mr. J. Hugh Goodman, of Reading, whose design was selected from among fifty others submitted in competition. Mr. George Moore, of Trowbridge, was the builder, his contract being for £6,934. The hospital provides accommodation for thirty patients, and comprises an administration block, three ward pavilions (heated by Shorland's central stoves), and a block containing the laundry, disinfectant chambers, ambulance, mortuary, &c. Laundry fittings have been supplied by Messrs. G. N. Haden & Sons, of Trowbridge, and sanitary fittings by Mr. W. E. Farrer, of Birmingham.

NOTES ON COMPETITIONS.

Proposed Central Library, Hackney.

THE Council of the Metropolitan Borough of Hackney has issued somewhat tardily its list of replies to competitors' questions in the competition for the proposed central library at Hackney, and the predominant feeling in the minds of all intending competitors after perusing the list must be one of anxiety, if not of disappointment, that no enlightenment has been vouchsafed upon the leading question, which runs: "(1) Although the Council does not bind itself to employ any of the architects whose designs are selected, may it be presumed that it is intended that the author of the first-premiated design shall be appointed, provided there is no valid reason to the contrary?"

In the absence of any official information upon this point it is pleasant to be able to place at the disposal of all who may be interested the result of

A Competitor's Interview with the Town Clerk.

to whom it was pointed out that the question was one which seriously affected all competitors, many of whom would not compete unless they received some definite assurance that their labour was not to be in vain. The town clerk replied that he had no reason to suppose that his Council intended to adopt any but the usual course. This is satisfactory so far as it goes, but it is not sufficient, and competitors should obtain a written confirmation of the Council's intention to act in the customary manner before embarking upon what appears a risky enterprise. There have been too many unsatisfactory results in competitions lately to make any reliance on chance aught but a foolhardy proceeding.

The Question of the Assessor.

A competition has usually been considered "safe" when it has been known that an assessor was to be appointed, other conditions being favourable; but recent experience has shown that even this is not without its risks, and a growing feeling of distrust is becoming evident against any competition the announcement of which is not accompanied by the name of the assessor. It is, therefore, regrettable to read in the list of queries and answers "(3) Has the assessor been appointed; if so, has he been consulted upon the conditions?" "No." True the conditions state that "the designs will be adjudicated upon by an assessor to be nominated by the president of the Royal Institute of British Architects, whose award shall be final and binding," but has the president been approached by the promoters? If so, why did he not appoint an assessor at once and make his appointment conditional upon the conditions being drawn up to the assessor's satisfaction and the publication of his name in those conditions? If not, upon what authority do the promoters make their statement?

Competitors have absolutely no means of knowing whether the gentleman appointed will be one upon whom they will be able to rely. If they are willing to believe that the president cannot err, then let no voice be raised in protest at any future award made under these auspices.

The Question of Fees.

Competitors should also satisfy themselves upon another point in the questions and answers. It is asked "(2) Will the architect appointed be paid in accordance with the schedule of professional practice as to charges of architects drawn up by the Royal Institute of British Architects?"—to which the answer is, "The conditions as to remuneration are set out in paragraph 4 of the particulars." Now, paragraph 4 of the particulars states that "a premium of fifty, thirty, and twenty guineas respectively will, in the

order of their selection, be paid to the authors of the three designs and plans which stand highest in the judgment of the assessor, and these designs will become the absolute property of the Council." This is ominous reading in the face of no guarantee that the successful architect will be employed; and although clause 5 does state what the architect's fees are to be if he is appointed, the question and answer can only be accepted as they are stated, unless a notification is received from the promoters that the answer referring to clause 4 was an error and should have referred to clause 5. With a list of answers so unsatisfactory as these, too much care cannot be observed by competitors before committing their schemes to an irrevocable fate.

An Elgin Competition.

In our issue for November 8th, under the heading of "Two more Unsatisfactory Competitions," it will be recollected that we dealt with the Elgin cemetery extension competition. Our remarks called forth letters from Messrs. Stewart & M'Isaac, the secretaries to the Cemetery Committee, and Mr. John Wittet, their architect, who stated he had acted as assessor. These letters we published in our issue for November 22nd, together with our comments on them.

We are now in a position to throw some further light upon the conduct of this competition, having been able to obtain additional information and a printed copy of the conditions, although the promoters withheld this from us. These conditions contain a number of unimportant details which we do not think it necessary to repeat.

The conditions were badly drawn, but the chief point is that the Cemetery Committee promised to appoint a qualified assessor. This they did in the person of their own architect. The gentleman is doubtless fully qualified, and a very proper person to act as an assessor in the ordinary way, but we hold that the committee should have stated they had this intention.

We have already referred to the fact that the committee's architect says he only reported on the three most likely designs, and that the committee, after careful consideration, unanimously selected the design of Mr. William C. Reid, architect, of Elgin.

On referring to a directory of architects published three or four years ago, we notice that there was a firm of architects at Elgin named Alexander & William Reid & Wittet, of 81, High Street, and from Kelly's "Directory of the Building Trades" for 1902 we find that a firm named Reid & Wittet had offices at the same address, though from a current directory of architects we do not see the same firm in existence. We notice, however, that an architect named W. C. Reid has his address at 8, Culbard Street, and Mr. J. Wittet now has his office at 81, High Street, Elgin.

Plans were returned to competitors with a curt note saying that another plan had been selected, but not mentioning who had been awarded the premium nor the name of the assessor, nor was there any intimation (we now learn) of an exhibition of the designs.

Mr. Wittet's letter to us stated that the object of the committee was "to give local men, as ratepayers, an opportunity of competing, and accordingly, after preparing a memorandum of conditions, advertised the competition in the local papers." One would infer from this that the advertisement was confined to the locality, that is, to the Elgin papers, but we are informed that this was not so, as the advertisement appeared frequently in newspapers in the south of Scotland, while we know as a matter of fact that competitors from other towns at some distance were allowed to compete. If the object was, as stated (and as has been accomplished), to give a job to Elgin competitors

only, the committee should not have advertised other than locally and should have mentioned that designs from Elgin competitors only would be accepted.

It will be apparent from the conditions that the work to be done was so small and unimportant that it was unfair to ask the public to waste time on it.

The Forthcoming Birmingham Competition.

On November 28th a special meeting of the Birmingham City Council was held to consider the proposal for the erection of additional municipal offices and an extension of the art gallery, and by a large majority the General Purposes Committee's recommendation to hold an open competition for the work was adopted. On the suggestion of Messrs. Aston Webb and E. Ingress Bell, consulting architects, sketch plans are first to be sent in, from which six or ten architects will be selected to submit final designs, each receiving an honorarium of 100 guineas. The competitors will be told the cost must not exceed £150,000, and that the buildings must be in reasonable conformity with the buildings on the other side of the street; but apart from that they will have a free hand. It is proposed to set back Edmund Street a little, so as to make it as wide as Congreve Street and Great Charles Street, 60ft., and Margaret Street is to be 50ft. wide. Speaking at last week's meeting Alderman Beale said they could not get the sketch plans before the end of next March, and under the most favourable circumstances they could not select the final design before the end of July. Then time would be required for the preparation of tenders and quantities, so that there would be a bare two years between letting the contract and the time the Council covenanted to have the buildings finished.

R.I.B.A.

New Fellows and Associates.

At a business meeting of the Royal Institute of British Architects held on Monday evening at 9, Conduit Street, W., the following elections took place:—

As Fellows.

(Of London where not otherwise stated.)

H. J. C. Cordeaux (East London, Cape Colony)	A. W. Moore
G. A. H. Dickson (Johannesburg)	G. E. Nield
H. J. Helsdon	J. Owen (Menai Bridge)
A. R. Hennell	A. Rigby (Douglas, I.M.)
J. N. Horsfield (Kingston-on-Thames)	Percy Robinson (Leeds)
W. G. Hunt (N.S.W.)	F. Rowntree
H. C. Kent (Sydney)	J. D. Swanson (Kirkcaldy)
	E. S. Underwood
	A. F. Watson (Sheffield)
	E. A. E. Woodrow

As Associates.

(Of London where not otherwise stated.)

L. N. Barrett	J. H. Markham
A. A. Carder (Clapham Common)	Leslie T. Moore (Great Yarmouth)
J. C. Cook (Bloemfontein)	V. Myer
O. S. Doll (Brighton)	J. J. S. Naylor
G. L. Elkington	Harry Prince
G. F. Ely (Liverpool)	E. Reid (Sunderland)
C. L. Fleming-Williams	Sydney Searle
J. L. Fouracre (Plymouth)	Noel Thomas
L. U. Grace	J. W. Walker
W. C. Le Maître	W. E. Watson

The results of the November examinations were announced.

It was set down on the agenda that Mr. Horace T. Bonner should move "That neither the president nor the council, nor either of them, shall approach the promoters of any competition with the object of their nominating competitors; nor shall the president or council appoint any professional assessor in any competition, unless requested to do so by the promoters of such competition." This motion, however, was withdrawn.

Mr. William Woodward, Mr. Gruning and other speakers discussed some clauses of the London Building Acts Amendment Bill. The meeting then terminated.

Keystones.

Blast Furnaces are proposed to be built at Swansea Docks by a company with a capital of £100,000.

A Chapel at Taunton School is to be built from designs by Mr. Frank Wills, F.R.I.B.A. It is the gift of Sir W. H. Wills.

A Statue of Whistler by Rodin has been commissioned by the International Society of Sculptors, Painters and Engravers. It is to be erected in Paris.

A Roman Bath, 6ft. 3ins. by 10ft. 6ins. inside, and weighing about 7 tons, has been unearthed during excavations for a fire-station in Cannon Street, London.

Several Cheap Cottage Exhibitions are to be held in 1907 under the organization of the National Housing Reform Council. The £200 cottage is to be taken as the standard.

Change of Address.—Messrs. Gregory & Co., masons, brickbuilders and contractors, have removed from 6, Overdale Gardens to more convenient premises at 35, Stockwell Place, Glasgow.

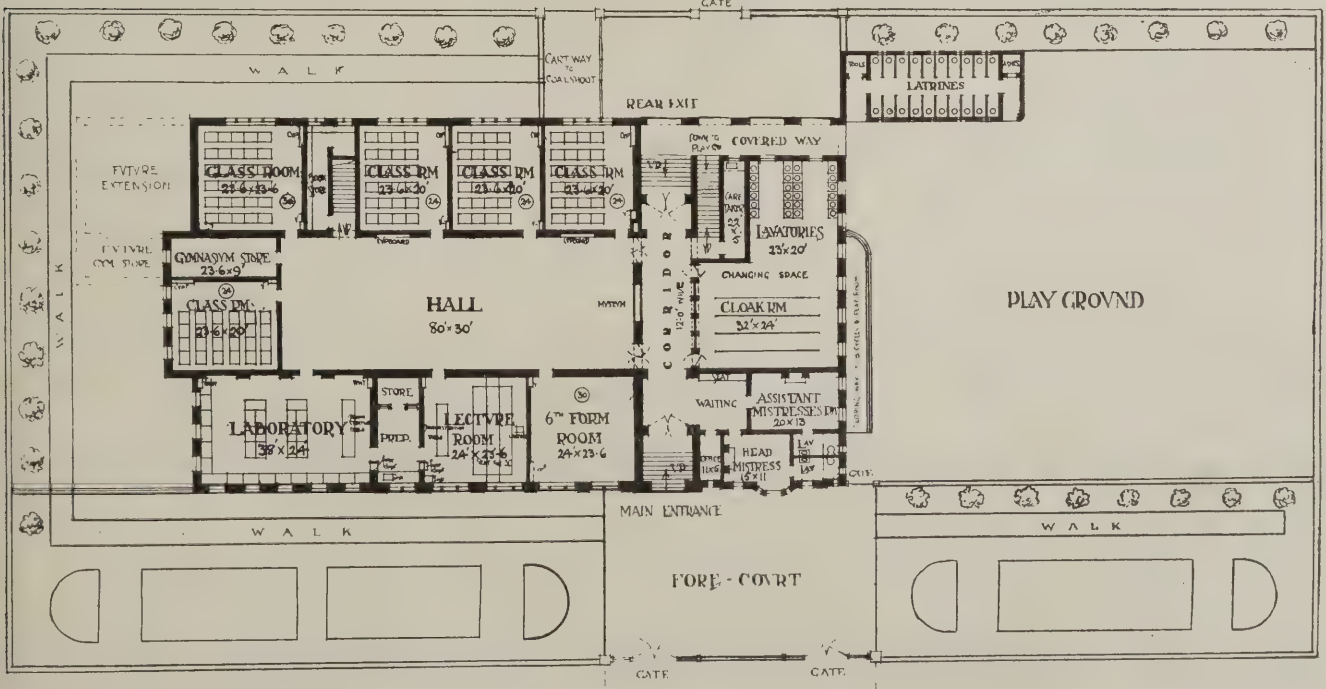

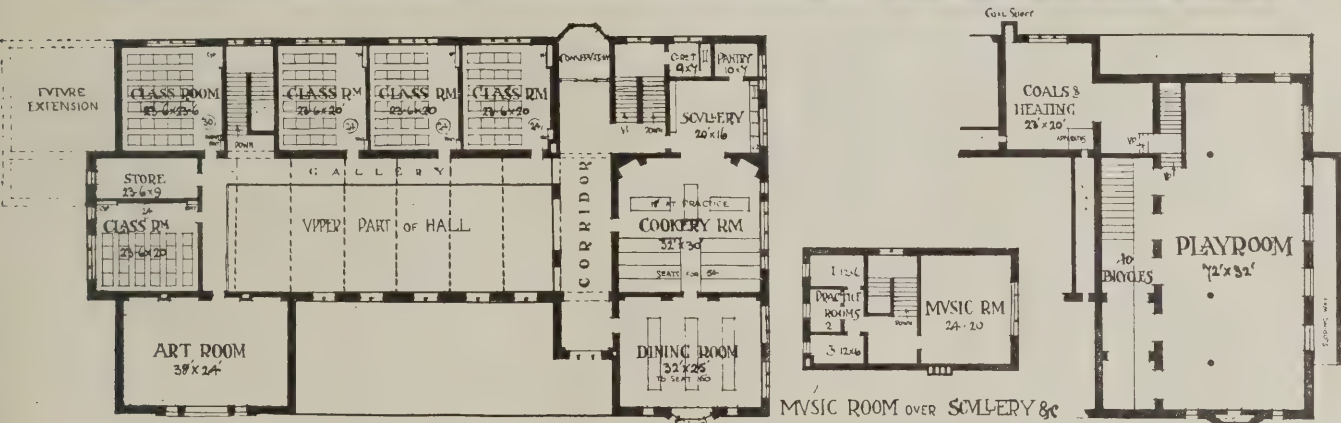

The Restoration of St. Bartholomew's-the-Great, Smithfield, which has been carried out by Sir Aston Webb, R.A., reached its final stage when on Saturday last the Bishop of London reopened and dedicated three bays of the east cloister—once used as a stable. A considerable amount of Norman and Perpendicular work remains visible.

At the Gunnery School on Whale Island a large new block has been recently built for the accommodation of the sub-lieutenants undergoing gunnery and torpedo courses. This building, which is of two storeys, with a concrete foundation, is 256ft. long, 27ft. wide and 34ft. high. It is of 215,000 cub. ft. contents, and comprises 100 bedrooms and the requisite bathrooms (mess-room and other portions additional adjoining). The contractors for the work were Messrs. Patman & Fotheringham, of London, who completed the building in the short space of six months.

New Workhouse and Infirmary at Hammersmith.—On Friday last Princess Henry of Battenberg opened the new workhouse and infirmary buildings which have been erected by the Hammersmith Board of Guardians at Ducane Road, Wormwood Scrubbs, from designs by Messrs. Giles, Gough & Trollope. The infirmary will accommodate 330 sick persons and the workhouse 428 destitute poor. The infirmary blocks are divided into wards, each of which contains twenty-four beds, in addition to which there are the necessary administrative departments, and a separate nurses' home. The cost of the buildings has been £207,000, exclusive of £14,400 for the site (about 14½ acres). A feature of the workhouse is the provision of comfortable quarters for aged married couples, which will prevent their separation in the workhouse.

PRESTON SCHOOL COMPETITION.

ON the opposite page we publish the first-premiated design in the competition for a secondary school for girls at Preston, by Messrs. Woolfall & Eccles, of Liverpool. The plans show the accommodation provided. The conditions required the building and boundary walls "to be faced with first-quality Accrington or other approved bricks," and all dressings to be of stone, sparingly used. The roofs were to be covered with the best North-country slates, and easy access was required to be provided thereto. The limit of cost was placed at £9,000. In our next issue we hope to give a few further particulars from the architects.

FIRST-PREMIATED DESIGN FOR SECONDARY SCHOOL FOR GIRLS AT PRESTON. WOOLFALL AND ECCLES ARCHITECTS.

Law Cases.

Disregarding the By-laws.—At the Darlington Police Court last week Samuel Scott, a builder, was fined £10 and costs for placing joists too far apart and committing other breaches of the by-laws in some cottages he was building in Thompson Street. The joists had been placed at an average distance apart of 17½ ins. after defendant had been cautioned by the borough surveyor and told they should be 15 ins. apart only. Concrete laid down was only 2 ins. thick instead of 6 ins., and an inspection chamber had not been provided.—At Falkirk Sheriff Court last week a builder named Abercrombie was summoned (1) for not giving notice to the local authority of the time at which the branch drains of a building which he had erected were to be tested, and covering up the drains without giving such notice, (2) for not constructing the drains properly, (3) for not ventilating the drains, and (4) for not providing a water-tight connection with the soil-pipe. For each of the first three offences a fine of £2 10s. was imposed, and £1 for the fourth—in all £8 10s.

Architect's Fees for Extras.—In the Lord Mayor's Court last week Mr. M. Garrood, architect, of London, sued Mr. Harper for £46 15s. for services rendered in connection with certain building operations at Hendon. The plaintiff's case was that he was employed as an architect to prepare drawings and tracings for the erection of two houses under a speculative building agreement. While the buildings were being proceeded with, the defendant took over the interest in the work. Under the original arrangement the fees were to be seven guineas per house. It became necessary, however, to get rid of the builder. The defendant then arranged to finish the premises, and the plaintiff was engaged to ascertain what was required. That was extra work not included in the original arrangement. The Recorder said that the case should be referred, as many items had to be enquired into. For the defendant it was suggested that the sum of £6 was sufficient to pay for the extra work. The case was eventually referred to the assistant judge to ascertain the amount due to the plaintiff.

Builders' Notes.

A new Branch of the National Association of Master House-Painters and Decorators is to be formed at Ramsgate and Broadstairs.

Scarborough Master-Builders' Association.—At the recent annual meeting of this Association Mr. R. H. Carr, who had previously acted for seven years as secretary and two as vice-president, was unanimously elected president.

A Slump in Building is recorded in the annual report of the Birmingham City Surveyor. During the past year the total number of plans submitted to the Corporation for approval was only 1,061, as compared with 1,563 in the previous year and 2,252 in 1902-3.

Manchester New Infirmary: Satisfactory Progress.—At last week's meeting of the Board of the Royal Manchester Infirmary the joint architects of the new infirmary (Messrs. Edwin T. Hall, of London, and John Brooke, of Manchester) presented a report on the progress of the building. They stated that the foundations contract was signed in May, and the work at once energetically proceeded with. In August the supplemental contract was settled to carry up all the buildings to the level of the ground floor. The present condition of the buildings was very satisfactory.

A new Suburb for Newcastle.—An extensive building scheme, providing for the erection of some hundreds of houses, will shortly be projected in the north-west of Newcastle-on-Tyne. The extension is part of the general plan for embracing the 90 acres of pasture land in the building area of the Fenham Estate Co.

Houses of Concrete Blocks.—At Walton-on-Thames, on the Felcott Estate, a number of houses are proposed to be built with concrete blocks made on the spot by the Cavity Ventilating Building Block Syndicate, Ltd., working the patent of Mr. J. G. Sidder, consulting engineer, of Brockley. The blocks are in two sections, connected with dovetailed dowels.

Winter Work for Painters and Decorators.—The operative painters and decorators of Saltley, Birmingham, have passed a resolution urging the City Council and all other local governing bodies to have all necessary inside cleaning and painting of schools, markets, baths and other public buildings that would be done next spring or summer put into operation at once to relieve the prevalent distress.

The Birmingham Builders' Exchange and Exhibition.—The catalogue of the newly formed builders' exchange and exhibition at Birmingham has just been issued. The building is in High Street, within three minutes of New Street Station, and in addition to providing an exchange hall where members can meet to conduct business, there are exhibition halls in which a representative collection of builders' materials of all kinds, both constructive and decorative, is displayed, thus affording an excellent opportunity for architects and builders to show their clients what is available, and also to keep themselves personally informed of everything that is up-to-date. We notice that the catalogue includes about half a dozen little articles, on "The Making of a Building," "Architecture," "Sanitation," &c. These are futile effusions, and seem to us to be quite out of place in what is essentially a business list.

Coming Events.

Wednesday, December 6.

QUANTITY SURVEYORS' ASSOCIATION.—Mr. F. B. Hollis on "Some Thoughts on the Quantity Surveyor, and his relation to the Building Owner, the Architect and the Builder," at 7 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. E. Macrae on "A Tour in Belgium," at 8 p.m.
ARCHITECTURAL ASSOCIATION (Discussion Section).—Mr. W. A. Forsyth on "The Conversion of the Jerry-builder," at 7.30 p.m.

Thursday, December 7.

CHEMICAL SOCIETY.—Meeting at 8.30 p.m.

Friday, December 8.

JUNIOR INSTITUTION OF ENGINEERS.—Annual Dinner.

ARCHITECTURAL ASSOCIATION.—President's "At Home" at 8.30 p.m.

NORTHAMPTON INSTITUTE.—Distribution of Prizes by Sir William Preece, and Conversazione, at 8 p.m.

Saturday, December 9.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS.—General Meeting at 2 p.m.

Monday, December 11.

SURVEYORS' INSTITUTION.—Ordinary General Meeting at 4 p.m.

Tuesday, December 12.

ARCHITECTURAL ASSOCIATION OF IRELAND.—Lecture by Mr. T. Baird at 8 p.m.

Wednesday, December 13.

NORTHERN ARCHITECTURAL ASSOCIATION.—Mr. T. Preston on "Italian Art and Travel," at 7.30 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. L. G. Mouchel on "Ferro-concrete Construction," at 8 p.m.

T-SQUARE CLUB.—General Meeting, Café Monaco, at 5.45 p.m.

Friday, December 15.

INSTITUTION OF MECHANICAL ENGINEERS.—Meeting at 8 p.m. Discussion on Alloys. Mr. E. G. Izod on "The Behaviour of Materials of Construction under Pure Shear."

ARCHITECTURAL ASSOCIATION.—Mr. W. H. Bidlake on "Church Towers and Spires," at 7.30 p.m.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Mr. J. A. Gutch on "The Homes of Queen Elizabeth's Courtiers," at 6.45 p.m.

JUNIOR INSTITUTION OF ENGINEERS.—Prof. J. T. Morris, M.I.E.E., on "Electrical Mains for Power Transmission," at 8 p.m.

CARRON

STABLE FITTINGS.

Many of the best-appointed Stables throughout the land owe their grace and perfect equipment to Carron Stable Fittings. These Fittings are the result of many years' practice and experience, and for style, strength, and service, they are absolutely unsurpassed.

They are made from specially selected materials, and are carefully fitted and tastefully finished. From a sanitary point of view they leave nothing to be desired.

You will best serve your own and your clients' interests by Specifying Carron Stable Fittings in your Schedules.

Write for Stable Fittings Catalogue No. 24.

Carron Company
INCORPORATED BY ROYAL CHARTER 1773

Electrical Notes.

Mr. Swinburne on Comparisons.

In the course of a paper read recently to students of the Institution of Electrical Engineers at Manchester Mr. James Swinburne, the well-known electrical engineer, referred to the comparative cost of different artificial illuminants, and made some interesting statements. He said that, taking the cost of electrical energy at 4d. per Board of Trade unit, an ordinary glow lamp would give nearly 800 candle-hours for 1s., while a flame arc lamp with energy at 3d. would give 14,000 candle-hours. It was to be remembered, however, that the 1s. was all spent on energy, nothing being allowed for the renewal of lamps, interest on fittings, meter rents, interest on lamps and cost of carbons and labour. For 1s. with energy at 5d., one got about the same light as with a flat-flame gas-burner and gas at 4s. per 1,000 cub. ft. But the ordinary oil lamp, with paraffin at 8d. per gallon, was far more economical, and even that was out of the running with acetylene. The great fight between electricity and gas had been fought with flat-flamed burners and carbon lamps, and there had been much discussion. He had been accused of a strong partiality for electric light; but he felt impartial: he really did not know which was the worse! The gas-mantle made an enormous difference and brought gas, say, 3s. ahead of everything but the mercury and flame arcs at, say, 4½d. per unit. The flame arc was essentially for large lights, while the mantle lights could be made quite small. The comparison was, of course, only for the same money paid for gas or energy. To make a real comparison, many other factors had to be taken into account. For one thing, there was the interest on the mercury lamp; then its colour

was not good; and if carbons were added, then the efficiency went down. On the other side, however, one had to estimate the cost of the mantles and the trouble arising from breakages, stopping up of the jets, &c. But even then it was clear that the mantle had a large margin of economy over house lamps such as the Nernst, the metal and the carbon incandescents. For outside use, however, and for large buildings the flame arc seemed to have plenty of margin over the mantle. Nevertheless, so far as interiors were concerned it was not to be forgotten that gas spoilt decorations, and consequently there was the extra cost of re-decorating to be set against it: and gas blackened ceilings and destroyed paint as well; so that the extra cost of decoration might be as heavy as the whole cost of the electric light, in which case it would not pay to employ gas at any price. "This argument annoys the gas industry; so it is sound and good."

Energy from the Victoria Falls.

The African Concession Syndicate has been in consultation with the leading American and Continental engineers and experts on the subject of the transmission of power from the Victoria Falls to the Witwatersrand. These authorities have unanimously expressed the opinion that the scheme is not only quite feasible, but would be commercially successful, especially as the climate of South Africa is one of the most suitable in the world for the transmission of power. There is no ice in the rivers to interfere with the working of the turbines and no snow to break down the transmission lines. The extreme dryness of the climate is also greatly in favour of the project. With reference to statements that the volume of water in the Falls is not sufficient to produce the necessary power, it is pointed out that even in the driest season yet experienced there is sufficient water to produce 500,000-h.p., while at present the Rand

only consumes 150,000-h.p. At the Falls there is an available head of about 330ft., and if more than 500,000-h.p. were needed it could easily be obtained by cutting a canal fifteen to twenty miles in length to a point lower down, where there would be a head of 1,000ft., sufficient to produce 1,000,000-h.p.

German Competition.

Germany is always an industrial competitor of ours, but in the electrical trade she is perhaps more formidable than in any other. This matter was referred to by Sir Joseph Lawrence, M.P., when speaking recently at a meeting at Westminster. He then stated, on the authority of the Prussian Minister of Commerce, that there were 450 syndicates in Germany, mostly connected with the metal industries, mines, chemicals and textiles. These associations, or cartels, in many cases made to such of their customers as wished to export a premium equal to the difference between the price they could get in Germany and the lower price at which they sold to outsiders. Since 1902 he knew of instances where many of these powerful firms, especially in the electrical engineering trades, again combined among themselves. The capital represented by these latest combinations was very formidable, and it was almost impossible for English manufacturers, in such trades as electrical engineering, to break through the cast-iron arrangement by which these German trusts not only kept the command of their own market but were becoming an almost irresistible power in neutral markets. It was a poor look-out for English electrical manufacturing firms who had to combat a threefold disadvantage, namely, Customs dues, patent laws and cartels. All the education and skill in the world, said Sir Joseph, could not alone overcome these barriers. Their effect was felt in the lessened opportunities of work for our own workpeople.

DATE OF DELIVERY.	DESIGNS REQUIRED.	AMOUNT OF PREMIUM.	DEPOSIT REQUIRED FOR CONDITIONS, &c.	FROM WHOM PARTICULARS MAY BE OBTAINED.
1906.				
Jan. 31	Hackney—Library ..	50, 30 and 20 guineas	£1 1s.	W. A. Williams, Town Clerk, Town Hall, Hackney.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

ARCHITECT'S ASSISTANT disengaged; 13 years' provincial experience. Design, working drawings, details, quantities, and supervision of works.—Box 1520, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT seeks SITUATION, age 21. Five years pupil of well-known London architect. Has designed and carried out over £1,000 of building work on own responsibility. Excellent references. Salary, 28s.—A. B., 82, Grosvenor Street, W. 1501

ARCHITECT'S ASSISTANT (nearly 22); over 5 years' London experience; student R.I.B.A.; design, working drawings, surveying, specifications, perspectives, correspondence, and general routine; salary moderate.—M., 7, Goulton Road, N.E. 1507

ARCHITECT'S ASSISTANT desires engagement in a London firm of Architects; good draughtsman, 6 years' experience and good references. Design, working and detail drawings, perspectives, &c. Moderate salary.—Apply E. O. N., 98, Elspeth Road, Clapham, S.W. 1518

ARCHITECTURAL DRAUGHTSMAN, 12 years' London and Provincial experience, requires engagement (28). Designs, working and detail drawings, specifications, perspectives, surveys and general routine, excellent references from leading firms. Salary 25 guineas.—Hookway, 36, Juer Street, Battersea Park, S.W. 1516

ARCHITECT and SURVEYOR'S JUNIOR desires EMPLOYMENT; 3½ years' experience, surveying, levelling, &c.; neat draughtsman; also 7 months' with electrical firm; good references.—SPURGEON, Havant. 1497

 Telephone, No. 1011 HOLBORN. Manager—JOHN B. THORP. Telegrams: "DIVIDITORE," LONDON

Notice to Advertisers.

"We wish to say that our advertisement in your valuable paper has brought us a large number of new customers and still increasing. We have now opened a Railway Depot to deal with the Stone trade."

The above is an extract from a letter received on the 27th November last from a firm who have regularly advertised in the "Builders' Journal" for the past two years, and which proves in unmistakable fashion the unequalled value of this Journal to Advertisers.

Educational.

R.I.B.A., SOCIETY OF ARCHITECTS AND CIVIL SERVICE TECHNICAL EXAMINATIONS, preparation by correspondence or residence. 29 first places.—G. A. T. MIDDLETON, 19, Craven Street, Strand.

Contracts Open.

BURTON-UPON-TRENT UNION.

TO BUILDERS AND CONTRACTORS.

The Guardians of the above named Union are prepared to receive TENDERS for the carrying out of certain ALTERATIONS and ADDITIONS at the UNION OFFICES situate at the Workhouse, Belvedere Road, Burton-on-Trent.

Persons desirous of tendering may see plans and specifications, and obtain Bills of Quantities with Form of Tender, at the offices of Mr. THOMAS JENKINS, Architect, Arcade Chambers, Station Street, Burton-on-Trent, by depositing the sum of One Guinea, which will be returned on receipt of a bona fide Tender.

Sealed Tenders endorsed "Tenders for Office Alterations," to be delivered to the undersigned at the Union Offices, Burton-on-Trent, not later than TEN o'clock a.m. on WEDNESDAY, the 13th DECEMBER instant.

The Guardians do not bind themselves to accept the lowest or any Tender.

By order,
 C. F. CHAMBERLIN,
 Clerk to the Guardians.
 Union Offices,
 Belvedere Road,
 Burton-on-Trent.
 1st December 1905.

BOROUGH OF FULHAM.

The Council of the above Borough is prepared, at its Meeting to be held on WEDNESDAY, the 6th day of DECEMBER, 1905, at 7 p.m., to receive TENDERS for MAKING-UP the CARRIAGE-WAY of Finlay Street, Fulham.

Plans and Specifications of the works may be seen, and any information obtained, from Mr. FRANCIS WOOD, A.M.I.C.E., F.G.S., Borough Surveyor, at his office, Town Hall, Fulham, S.W.

The Contractors are to attend personally, or be represented at the Council Meeting, to deliver their own Tenders, together with a £10 note and a Schedule of Prices, upon which the value of any extras or omissions shall be based, and to make a declaration that they pay the trade union rate of wages, observe such hours of labour as are generally accepted as fair in their trade, and that all unskilled labour shall be paid the minimum wage of 7d. per hour.

The Council does not pledge itself to accept the lowest or any Tender.

R. M. PRESCOTT,
 Town Clerk.

TOTTENHAM EDUCATION COMMITTEE.

TENDERS are hereby invited for the ERECTION of a SCHOOL to accommodate 1,200 children on the Parkhurst Road Site, Tottenham.

Applications for quantities to be made to the Architect, Mr. G. E. T. LAURENCE, A.R.I.B.A., 22, Buckingham Street, Adelphi, W.C., on or before the 9th DECEMBER next, after which date plans and specifications may be seen at his office.

The sum of two guineas will be charged for the quantities, which sum will be returned on receipt of a bona fide Tender, accompanied by the conditions and priced quantities, otherwise the deposit will be forfeited.

The priced quantities will be returned to the unsuccessful firms.

Persons Tendering will be required to deposit with the CLERK, when banding in their Tenders, in Bank of England notes or cash, the sum of ten pounds, which will be forfeited by the person whose Tender is accepted if the Contract be not executed within seven days from the date he is informed it is ready for signature.

This deposit will be repaid to the parties Tendering who are unsuccessful.

The Contractor will be required to pay all workmen on the Committee's work the recognised trade union rate of wages.

The Committee do not bind themselves to accept the lowest or any Tender.

Signed W. MALLINSON,
 Clerk to the Committee.
 Education Committee Offices,
 Philip Lane,
 South Tottenham,
 22nd November, 1905.

VOLUMES I. to XXI. of THE BUILDERS' JOURNAL.

Handsomely bound in cloth gilt, 7/- each.

Binding Cases for any of the above Volumes can now be obtained, price 1/9 each.

THE VALUE OF OUR EMPLOYMENT REGISTER.

THIS REGISTER was commenced as a serious endeavour on our part to meet a need that is continually felt both by EMPLOYERS and EMPLOYED, and we are pleased at the practical appreciation that has been shown by our readers since THE REGISTER was first started.

Nothing is more trying than to be out of employment, but the difficulty of the position is terribly augmented when money has constantly to be paid for advertisements in order to find other occupation.

On the other hand an Employer who has just obtained an important contract most likely needs you; and has a post to fill that you are wanting, but neither of you can find each other.

THE REGISTER serves this purpose and so meets both cases. For those wanting employment it is an inexpensive means of keeping their names and qualifications before the right people, and for the Employer it is a ready means of finding just the man he wants, without delay.

We are encouraged to find how largely our columns have been instrumental in meeting the requirements of both parties in the manner indicated above, and we thank those advertisers who have written expressing their pleasure and indebtedness to THE REGISTER.

Many have found it an invaluable aid in getting appointments, and we would urge all those who are out of work, or want to change their situations, in fact, all who have a "want," to make use of these columns and thus make THE REGISTER a record of still more value to Employers and Employed.

For 3s. we give 3 insertions (four lines), in our "Appts. Wanted" Columns, and also 6 insertions in the "EMPLOYMENT REGISTER" (see page xx).

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

THE BUILDERS' JOURNAL SUPPLY DEPARTMENT,
6, Great New Street, Fetter Lane, E.C.

THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

December 13, 1905. Vol. 22, No. 566.

6, Great New Street, Fetter Lane, E.C.

Summary.

The Charing Cross roof collapse appears to have been due to the breaking of a tie-rod in the truss next to the wind-screen. We suggest that the factor of safety was reduced considerably by the inadequacy of theoretical reasoning in regard to the load a truss in this position has to sustain, and that this reduced the factor of safety to so small a limit that the corrosion and other contributory minor causes resulted in failure. (Page 336.)

The improvement noted in the London wood market in October was maintained in November, though it has had little effect on prices. Business for next year has not yet opened. It is certain, however, that Swedish shippers are very sanguine of establishing a substantial rise on present prices. (Page 338.)

The Liverpool timber trade has been active during the past month. A large number of foreign-made doors has been received. (Page 339.)

The penalties attaching to the use of misleading descriptions of white or red lead, indicating highest quality, whereas analysis proves them to be adulterated, are unusually heavy, even going so far as imprisonment with hard labour. In this connection the White Lead Section of the London Chamber of Commerce is prepared to examine and report on, free of charge, any sample of white or red lead bought as best, genuine, or under any other term implying highest quality. (This page.)

An interesting case to property owners was heard recently. The agent of the landlord of a house, in consideration that the tenant withdrew a threat to quit, promised that a defective kitchen floor should be repaired. This was not done, however, and as a result of the neglect the tenant's wife met with a serious accident, for which damages were claimed. Judgment was entered for the plaintiffs, but the Court of Appeal held that the female plaintiff had no cause of action. (Page 340.)

There are several firms who supply machinery of all descriptions on the hire-purchase system. This system has been in operation for a series of years, and has been highly beneficial to both hirer and owner. (Page 335.)

The Royal Academy gold medal and travelling studentship (value £200) for a design for a British embassy in a foreign capital is won this year by Mr. Leslie Wilkinson. (Page 345.)

Fraudulent Trade Descriptions.

A USEFUL work is being performed by the White Lead Corroders' Section of the London Chamber of Commerce in securing proper protection for the public in regard to the quality of white and red lead. Users, especially small buyers, have been misled in buying as "best," "genuine," or other term indicating the highest quality, a lead which on analysis has been found to be adulterated, and the Section draws attention to the fact that it is a distinct breach of the Merchandise Marks Act, 1887, to describe and sell as "best," "genuine," or other similar term, any white or red lead which contains any adulterant, such as barytes, lime or any other foreign added matter. The penalties attaching to the use of misleading terms under the Merchandise Marks Act are unusually heavy, and even go so far as imprisonment with hard labour, so that it behoves everyone in the trade to take due precautions against their offering or having in their possession for sale white or red lead which bears a misleading description within the meaning of the Act. In this connection the Lead Section of the Chamber is prepared to examine and report on, free of charge, any sample of white or red lead bought as "best," "genuine," or other term indicative of the highest quality, if a small sample of the same is sent to "The Inspector," White Lead Corroders' Trade Section, London Chamber of Commerce, Oxford Court, London, E.C. A half-pound sample will be sufficient for the purpose of analysis. It should be mentioned that the Section in its endeavours to protect the small user has undertaken several cases in different parts of the country, under the Merchandise Marks Acts, against firms selling adulterated lead as "best" or "genuine," and, with one exception, convictions have been obtained and heavy penalties inflicted. In this connection the Section particularly desires to urge buyers to take care when purchasing genuine white and red lead to insist on its being marked and invoiced as such. This is necessary for their own protection, as, in the event of the quality of the article sold by the retailer being challenged, he has only to produce his guarantee of quality, that is, the marked keg or the invoice, and the dealer at once becomes responsible and liable to prosecution should the article prove other than of the quality guaranteed. It would

be well if the protection given by the Merchandise Marks Act could be extended to building materials generally.

Lessons from Charing Cross. FROM an examination of the working drawings of the Charing Cross station roof, and the light thrown by the circumstances of the disastrous collapse last week (see p. 336 of this issue) it is apparent that there were several features in the design which may be subjected to criticism. The result of all the trusses except the wind-screen being alike, and the station being divided into equal bays, was that although the end truss next the wind-screen was theoretically considered to sustain half the preceding and half the last bay, it probably had to carry the whole of the latter, for when a high wind was blowing the gable screen with the great leverage must have given, however slightly, inwards and thrown the whole weight on to the truss. This would have reduced very considerably the factor of safety, and naturally in the course of years the corrosion would have assisted. A contributory cause may have been that the saddle expansion-bearing at the end was inefficient and probably helped to strain the tie-rod. This was improved upon in the design of the Cannon Street station, designed by the same engineer and erected two years later, in which an ordinary form of roller expansion was adopted. Another defect also acknowledged to have been improved upon in the Cannon Street roof was the instability of the trusses against overturning. This was remedied by splaying out the ends of the principals to give a wide bearing on the wall. If this had been the case in the Charing Cross roof, perhaps the wind-screen would not have toppled over. The lessons to be learnt from the collapse are the desirability of a thorough examination of all early engineering structures, because there are many roofs of this type which are equally likely to collapse, and secondly that the end truss next a wind-screen is strengthened so as to bear the extra strain due to leverage in a wind, or that the last bay is halved so that the truss shall sustain an equal amount of roof surface to the other bays and not half as much again. Whether a flaw contributed to the failure at Charing Cross or whether the rod had been reduced in section in the course of years by drawing out, due to over-strain, or to corrosion, will only appear from the Board of Trade enquiry.

THE HIRE OF BUILDERS' PLANT.

C. PASSMORE.

A GREAT difficulty is often experienced in ascertaining the terms for hire of builders' plant, as the firms who let such plant on hire do not publish any price lists, the chief reason being that advantage would be taken of them by competitors, who would quote a slightly lower price. Another reason is that the charges for hire greatly depend upon the period for which the plant is required, and whether it is wanted with or without the option of purchase; in fact, there are so many conditions affecting the charge that it is desirable to rely rather upon special arrangements than upon any fixed rates. It is obvious, therefore, that the following rates must not be taken as definite, but as approximate only. Such a complete list has never been published before, and it should be of assistance in computing approximate charges for hire. The following are

The Usual Conditions

of hiring builders' plant:—

(1) All persons (or their agents) hiring plant should see for themselves that the goods they hire are sound and sufficient for the purposes for which they are required, as ——— will not be responsible for any damage or loss incurred through unsoundness or insufficiency.

(2) When the charge for hire exceeds the amount of deposit, a fresh deposit must be paid, or the goods returned.

(3) All goods on hire must be taken, sent for and returned at the expense of the person hiring the same. All deficiency or damage to goods on hire will be charged for, together with the hire of the goods up to and including the day when such deficiency has been ascertained. When any and all goods are returned, the deposit note must be brought with them. Without this note no deposit will be returned. Goods on hire must be returned during business hours.

(4) Persons desirous of purchasing goods on hire can do so on the following terms, namely, the full value to be charged for each article and, in addition, half instead of the whole of the usual hiring fee, which will be reckoned up to the time the hirer gives notice of his intention to purchase.

(5) Scaffold cords and rope falls must not be cut, or the full value will be charged.

The above conditions vary very little with the different firms who let on hire such plant as ladders, steps, poles, &c., but for the hire of steam engines, pumping and other kinds of machinery a banker's and two trade references are generally required.

In the following list of charges for hire the writer has given the amount of deposit required, so far as can be ascertained:—

Travelling Cradles.

The charge for the hire of Palmer's wire-supported travelling cradle is 20s. per week per cradle, and fixing extra according to roof. There is such variety of detail in roofs that without a knowledge of the roof or a rough sketch it is difficult to estimate what the fixing will cost. In London it is generally safe to estimate a 25ft. frontage at £2, but it quite depends on the nature of the roof. Estimates for fixing can be had free of charge from the firm, who generally quote inclusive terms, including fixing, hire, and removal on completion.

In the hiring of plant it is usual for the hirer to pay carriage and all expenses of removal, &c. The charges for hire have also to be paid monthly (for large plant) and in advance.

Steam-rollers.

There are several firms in different parts of the country who let out steam-rollers on hire. The rate is usually from about 3s. per hour, or from 25s. to 30s. per day of 10 hours, including man's time, fuel and everything except water. Where the rate is quoted exclusive of the above it may be taken that an engine-driver's wages will be from 35s. to 45s. per week, and the consumption of fuel about $\frac{1}{2}$ cwt. per hour—say a cost of 7d. per hour. About 200 sq. yds. of metalled roadway can be rolled down in an hour.

The Hire of a Steam Navvy

is an exceptional thing, as it is only used by large contractors, who buy the machines from the makers. Applicants have been told to apply to Messrs. Wilson & Co., of Liverpool, Messrs. Whitaker Brothers, of Leeds, and Messrs. Ruston & Proctor, of Lincoln, in regard to the hire of steam navvies. These firms, however, do not let steam navvies on hire, but make them to order. The best people to apply to would be large contractors like Messrs. Pearson & Son, Aird & Sons or Pethick Brothers. The cost of hiring a steam navvy may be anything from £3 to £15 a day or from £100 to £400 a month. The working expenses may also vary from 25s. to 40s. per day for coal, water, oil, wages, &c.

The Hire-Purchase System.

There are several firms who supply machinery of all descriptions on the hire-purchase system. This system has been in operation for a series of years, and has been highly beneficial to both hirer and owner, as the hirer gets the opportunity of availing himself of machinery that is self-supporting, whilst the owner has full security for his property without the publicity of registering it as a bill of sale; moreover, the hirer becomes the absolute owner of the machinery, provided, of course, that due payment has been made of all the instalments agreed upon. The terms of payment vary according to special circumstances, but the following may be taken as a guide:—One-third of the ascertained total purchase price in cash, and the balance with interest at 5 per cent. spread over a term of two years.

The machinery required is selected in the ordinary manner, and is supplied to the hirer under a simple agreement (a document requiring no registration and to which no publicity whatever attaches). The extra charge may be estimated at 5 per cent. on the amount for which payment is deferred, which amount is generally allowed should the hirer desire to fully pay off the instalments before they become due under the terms of the agreement.

Supposing that a builder requires machines the list price for which is, say, £400, and that he cannot conveniently spare more than £80, and requires the balance of £320 to extend over a period of twelve months, the terms would be as follows:—

COST OF MACHINES.

Machines	£	s.	d.
5 per cent. on £320 for 12 months	400	0	0
	16	0	0
	£416	0	0

PAYMENTS UNDER HIRE-PURCHASE AGREEMENT.

Cash on signing agreement	£	s.	d.
1st quarterly payment	80	0	0
2nd "	84	0	0
3rd "	84	0	0
4th "	84	0	0
	£416	0	0

So that for an extra charge of £16 on the list price of machines the hirer becomes absolutely possessed of the machines in twelve months, by which time it is presumed that the machinery will have earned its cost. Arrangements and the amounts to be paid down vary according to circumstances and the different firms who supply machinery on the above terms.

Stone-breaking Machines

can be had on hire, with option of purchase or deferred payments, as follows:—

Size of stone each machine will take.	Product per hour to zins. size and under, about	Product per hour to 1 in. size and under, about	Price.	Terms on hire, with option of purchase, per month.

20×11			150	
20×12			160	
24×12			200	
24×13			220	

Form of Agreement.

In the case of hiring plant on the hire-purchase system it is usual for the owner of the goods to fix a small plate to the machine to prevent it being seized should the builder become bankrupt or make any arrangement with his creditors during the period in which the instalments are being paid and for the purpose of purchasing the machine. The following is an agreement which has actually been used in practice. It may therefore be taken as a basis for similar agreements, or without alteration if applicable:—

An agreement made the _____ day of _____ one thousand nine hundred and _____ between _____ of _____ in the county of _____ (hereinafter called the lessor) of the one part and _____ in the county of _____ (hereinafter called the tenant) of the other part whereby it is agreed as follows:—

(1) The lessor will let and the tenant will hire the machinery, articles and effects enumerated in the schedule hereto (hereinafter called "the scheduled articles") on the conditions set forth in the following clauses and in the annexed schedule.

(2) The tenant shall during the hiring pay to the lessor the several rents set forth in the schedule hereto on the days herein respectively mentioned.

(3) If default is made in the payment of any of the said rents the tenant shall pay the lessor interest on the rents in respect of which default is made at the rate of 5 per cent. per annum from the several days when such rents become due until payment.

(4) The tenant shall take proper care of the scheduled articles and keep the same in good substantial repair, working order and condition.

(5) The plates attached to the scheduled articles inscribed with the lessor's name and address shall remain attached thereto for the purpose of making the ownership publicly known, and such plates shall not be removed or defaced by the tenant. If any such plates shall be injured or defaced the tenant shall within three days restore the same to their proper condition.

(6) If the scheduled articles or any of them are removed, seized or taken out of the possession of the tenant, the said tenant shall within twenty-four hours give written notice to the lessor of such removal, seizing or taking, and also give to the lessor the address of the place to which the same are removed.

(7) The tenant shall during the hiring keep the scheduled articles insured against fire, in the several sums set opposite thereto respectively in the schedule. Such insurance shall be effected in the name of the lessor in some office approved in writing by the lessor. The policy of insurance and the receipts for

the premiums paid thereunder shall be delivered to the lessor. If the tenant make default in effecting or keeping up such insurance, the lessor may effect and keep on foot the same, and the tenant shall repay to the lessor all moneys paid by the lessor for such insurance with interest thereon at the rate of 5 per cent. per annum until payment. Any moneys received under any policy effected under this agreement shall be applied in replacing or restoring the articles in respect of which the same were paid, but subject to the right of the lessor in the first place to retain thereout any sums which may be due from the tenant to the lessor under this agreement.

(8) The lessor shall at all time by his officers and agents have access to the scheduled articles to inspect the condition thereof.

(9) The tenant shall within ten days after notice in writing from the lessor of any want of repair or injury in or to the scheduled articles, or any of them, make good any such want of repair or injury to the satisfaction of the lessor.

(10) The tenant shall upon demand by the lessor or any person authorized by the lessor produce the last receipt of the rent of the premises where the scheduled articles or any of them may be.

(11) The tenant shall not assign this agreement or sublet or part with the possession of the scheduled articles or any without the consent in writing of the lessor.

(12) The tenant may determine this agreement and the hiring thereunder at any time by delivering to the lessor or to his order at his own cost and expense the scheduled articles so let to him on hire by the lessor as aforesaid.

(13) Upon the happening of any of the following events, that is to say:—

(a) If a receiving order is made against the tenant or the benefit of any act is taken for the relief of insolvent debtors;

(b) If the tenant make any assignment for the benefit of or compound with his creditors;

(c) If any distress or any execution is levied or sued out against the tenant;

(d) If any rents payable under this agreement are in arrear for fourteen days after they respectively become due, whether demanded or not;

(e) If the tenant commit any breach of any of the provisions herein contained,

the hiring shall determine and the lessor may without further notice or demand enter upon the premises where the scheduled articles may be and take possession of and remove the same.

(14) Notwithstanding the determination of the hiring under either of the two preceding clauses and the resumption of the possession of the scheduled articles by the lessor, the tenant shall remain liable to the lessor for all rents and other sums of money and interest which have become due to the lessor, including the apportioned rent down to the date of the retaking or delivering possession, as the case may be, and shall also remain liable for all breaches by the tenant of the provisions of this agreement prior to such retaking or delivery of possession. The tenant shall also pay to the lessor all the expenses the lessor may incur in or about such entry, retaking of possession or delivery and removal.

(15) Upon payment by the tenant of the last of the rents hereby reserved and all other sums (if any) which may be due to the lessor from the tenant under this agreement, the scheduled articles shall become the property of the tenant, but subject to this provision the scheduled articles shall be and remain the sole property of the lessor.

(16) All the powers and provisions herein contained shall be exercisable by and extend to the lessor or his assigns, and the expression

"the tenant" shall include his executors, administrators and assigns.
As witness the hands of the said parties the day and year first above written.
(Signatures over 6d. stamp.)

CHARING CROSS ROOF COLLAPSE.

OF the terrible disaster caused by the collapse of two bays of the roof at Charing Cross Station on the evening of December 5th, the daily press has already reported in full, so far as the ordinary details are concerned, but in connection with the accompanying illustrations we desire to make a few remarks on the technical aspect of the subject. The lessons to be learnt from the catastrophe will be found dealt with as a leader in this issue.

Briefly, it may be stated that the result of the collapse was as follows:—The station roof was demolished for a distance of 70ft. from north to south, the entire span, 164ft. in width, collapsing, and a large portion of the auditorium of the Avenue Theatre wrecked on the west side of the station. It seems apparent from the accounts of the

disaster, and from an examination of the wreckage which we have made, that what really happened was that the tie-rod of the first bowstring roof truss behind the wind-screen snapped. The portion of the roof sustained by this truss then curved inwards, pulling over the wind-screen, which in falling broke right across the middle, tipping over lumps of masonry on the east side into the cab rank in Villiers Street, and on the west side forcing nearly the whole height of the wall down, throwing this brickwork and a certain amount of ironwork on to the roof of the Avenue Theatre, at the end of Northumberland Avenue, which was in course of reconstruction at the time. Our views clearly show this. In the large view it will be seen how the wind-screen lays across the station, spread out like a fan, and the marks where it scored the eastern wall in falling will also be noticed. The portion of the wall demolished by the western end of the wind-screen is shown in another view, with the end of the bottom boom or girder resting on the portion of the wall still left standing.

The small court separating the Avenue Theatre from the station wall has a large amount of debris at the bottom. The wall that fell over on to the Avenue Theatre smashed in the roof over the auditorium, as the accompanying photograph shows. The debris laying against the outer wall of the Avenue Theatre rendered this unsafe and it had to be shored up.

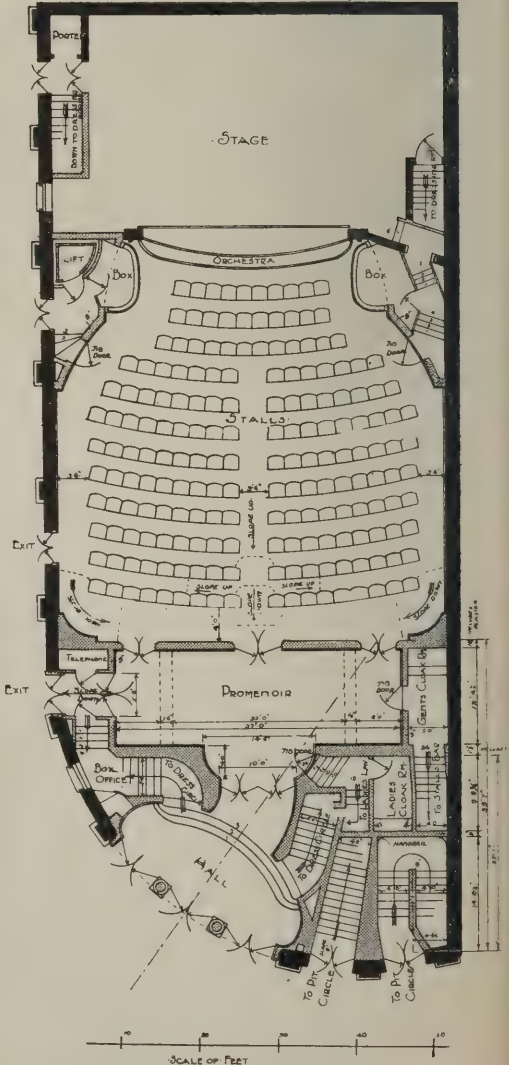

There is some confusion in the accounts of the disaster, but we think that the fact that the tie-rod of the roof truss behind the wind-screen was the cause is fairly well established.

CHARING CROSS STATION ROOF COLLAPSE: VIEW OF THE DISASTER.

Sir Benjamin Baker, who was called in to assist Mr. P. C. Tempest, the Chief Engineer of the South-Eastern and Chatham Railway, ascribes the disaster to this, as also does the official statement issued by the general manager of the company. The "Daily News" published a more circumstantial account from an eye-witness inside, who said that he first heard a loud noise in the roof which caused him to look towards the bridge end of the platform, where he saw the tie-rod had snapped off about a third of the way across. An outside eye-witness from the Savage Club, whose attention was attracted by a rumbling noise, described how he saw the wind-screen bend inwards towards the station and seem to break as it dropped. Another witness said he was inside towards the river end of the station and saw the crown of the arched roof bend and begin to give first, while another witness from outside the station is said to have observed a kink in the top of the roof. We think this clearly proves that the truss was the faulty member and not the wind-screen.

We publish a section of the roof to show the type upon which it was designed by the late Sir John Hawkshaw and constructed and erected by Messrs. Cochrane & Co., of Dudley. The station was opened in 1864. The roof is 512ft. in length and divided into equal spaces by fourteen wrought-

iron trusses in addition to the gable wind-screen. The clear span is 164ft. The principals, it will be seen, have vertical uprights and are trussed and divided into nine equal spaces. These trusses are placed 35ft. apart. The rise of the tie-rod is 25ft. and of the curved rib 45ft. above the springing level, giving a truss 20ft. deep at the centre. The trusses are fixed at one end and hinged to a saddle bearing at the other. There are no wind ties, but intermediate lattice frames give stiffness. The roof covering consists of glass and zinc.

The working drawings of this roof are to be found in the 1864 volume of "A Record of the Progress of Modern Engineering," edited by William Humber, and published by Messrs. Crosby, Lockwood & Son.

The Avenue Theatre, which has so greatly suffered by the Charing Cross catastrophe, was in course of partial replanning and re-decoration under the direction of Messrs. Detmar Blow & Fernand Billerey, architects. The accompanying plan shows what difficulties had to be faced to satisfy the London County Council requirements and to give a spacious and architectural treatment of the auditorium. Nearly the whole of the wall-surface and auditorium was to be covered with paintings. The work was going to be completed by the end of this month, but it has been terribly smashed, as the photographs show. None of the walls or tiers of the theatre have fallen down, but it appears that they could hardly be safely restored, so much are they cracked.

DIAGRAM OF THE ROOF TRUSS.

THE TIMBER TRADE.

London Market in November,

THE improvement noted in the London wood market in October was maintained in November, although it has still had but little effect on prices. The importation was about normal, rather more than usual from Swedish and Norwegian ports and rather less than usual from Russia. The deliveries from the docks totalled to within 400 standards of those for November last year, while the overside figures exceeded those for November, 1904, by 2,400 standards. In this last item, Messrs. Churchill & Sim observe, there is a cheerful significance that the shrinking of market power is perhaps at an end, and that a better state of things may at last be hoped for. Business for next year has not yet opened except for such specialities as are no guide to the general market. It is certain, however, that Swedish shippers are very sanguine of establishing a substantial rise on present prices during the coming selling season. Their hopes are based largely on the paralysing effect of political and financial events in Russia on the competing supplies from that country, which effect it is easy, however, to over-estimate; but they are on more substantial ground when they point to the small stocks held in this country and to the improvement in general trade here, which should have had time to affect the wood trade, though late as usual, in the coming year. The hindrance of the expected General Election during the winter months should be only of transitory importance.

The abstract of dock stock, consumption, &c., for November, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on November 30th was:—

	Pieces.
Foreign deals and ends - - -	1,759,000
Do. battens - - -	2,600,000
Pine deals and battens - - -	979,000
Spruce do. do. - - -	898,000
Boards, rough - - -	4,361,000
Do. prepared - - -	6,826,000
Totalling 17,623,000 pieces, as against 19,838,000 for 1904, 23,391,000 for 1903, and 23,458,000 for 1902.	

In other kinds the stock was as follows:—

Foreign wainscot logs - - -	174 pieces.
Do. oak timber - - -	725 loads.
Do. fir timber - - -	2,433 do.
Do. Oregon pine, &c., spars and masts - - -	5,649 do.
Colonial oak timber - - -	5,514 do.
Do. birch timber and planks - - -	4,946 do.
Do. elm and ash timber - - -	1,052 do.
Do. yellow pine - - -	533 do.
Do. red pine - - -	64 do.
United States pitch-pine timber - - -	15,983 do.
Do. do. deals - - -	39,000 pieces.
East India teak - - -	6,605 loads.

The deliveries for the first eleven months have been—

	Pieces.
Foreign deals and ends - - -	2,903,000
Do. battens - - -	5,236,000
Pine deals and battens - - -	979,000
Spruce do. do. - - -	1,268,000
Boards, rough - - -	4,947,000
Do. prepared - - -	13,693,000
Totalling 29,026,000 pieces, as against 31,287,000 for 1904, 33,524,000 for 1903, and 35,856,000 for 1902.	

The deliveries for November

were as follows:—

	Pieces.
Foreign deals and ends - - -	298,000
Do. battens - - -	427,000
Pine deals and battens - - -	93,000
Spruce do. do. - - -	97,000
Boards, rough - - -	491,000
Do. prepared - - -	1,147,000
Totalling 2,553,000 pieces, as against 2,695,000 for 1904, 2,870,000 for 1903, and 3,298,000 for 1902.	

Deliveries from Ship to Craft.

The deliveries direct from ship to craft for the first eleven months of the year have been:—

	1904.	1903.	1902.
	P.s.h.	P.s.h.	P.s.h.
Deals & battens - - -	110,650	102,849	107,121
Boards - - -	24,884	18,911	22,921
Total -	135,534	121,760	133,051
	P.s.h.	P.s.h.	P.s.h.
Deals and battens - - -	7,133	5,623	8,069
Boards - - -	2,680	1,826	2,204
Total -	9,813	7,449	10,273

Soft Woods.

Swedish Deals and Battens.—There is little change to note in prices for Swedish goods in London during November. The importation has been a large one all round—deals, battens and boards—but the tone of the market has been good throughout, and, especially for deals, there has been some indication of a steadier demand.

Norwegian Boards.—The importation during November of Norwegian prepared boards was just under that of November last year, and with no further falling off in the demand a more defined improvement in prices might have been looked for. The large arrivals from Sweden have, however, prevented this, and rates are still very little over those of a month ago.

Russian Deals.—There has been nothing in the political situation in Russia to put a stop to the export of wood, and this has gone on smoothly without any exceptional hindrance. The importation to London, however, during November was small, shippers having sold out their later supplies to more attractive markets.

Finnish Battens.—There was a considerable arrival of Finnish battens in London during the month, which kept the market steady, and the growing competition to secure stock at the old prices has not yet proved strong enough to raise them much beyond the level of October.

Prussian Timber.—There is very little life in the market here for fir timber. The importation has been a small one, and prices at the shipping ports are high, while the rise in quotations for pitch-pine timber should also have helped the Danzig shipments. Nevertheless London prices remain unaffected, and any endeavour to sell results unfavourably. For oak timber there has been a better demand again, but only at low prices, which show little improvement on those of the summer.

Canadian Timber.—In November the arrivals of pine and spruce deals from the St. Lawrence were very small, and the spruce shipments from New Brunswick, though larger than those in November last year, were also quite unimportant. The London

market for pine deals has been very dull, and quotations are only maintained by holding on to the small stocks. For spruce, prices are nominally higher again in sympathy with the scarcity, the high cost and the genuine rise in other classes of whitewood, but they are paid very grudgingly, and for wholesale quantities the market can hardly be said to have been stronger than it was in October. A good deal of sawn timber was ponded in London during November, and the stock is fairly up to current requirements, although still quite short enough if the deliveries are to increase as they have done during the past month. Quotations for wood for shipment have risen to an altogether exceptional level, and there are the usual statements in such circumstances that prices are never coming down again. No doubt this wood has been sold too cheaply in the past and may likely enough not come down again to its former level, but there will continue to be fluctuations in this as in other things, and a cargo of 12in. Oregon pine timber of fine length which arrived in London during November points to a possible alternative source of supply.

Hardwoods.

Teak.—Messrs. Denny, Mott & Dickson Ltd., state that the landings in the docks in London during November consisted of 33 loads of logs and 74 loads of planks and scantlings, or a total of 405 loads, as against 1,133 loads for the corresponding month of last year. The deliveries into consumption were 804 loads of logs and 551 loads of planks and scantlings—together 1,355 loads, as against 1,094 loads for November, 1904. The imports continue to be very inadequate, having during November only amounted to some 30 per cent. of the consumption. The demand continues to be checked by the still-advancing cost, but stocks in the hands of consumers have run so low that the necessity of providing for work in hand is driving unwilling buyers into the market, and probably the demand will continue to develop, whilst the supplies give no such promise—so far as Rangoon, Moulmein and Bangkok descriptions are concerned. These conditions are giving a great impetus to shipments from Java, but the supply of this wood in merchantable sizes cannot be sufficient to compensate for the serious falling off in the shipments from Burmah and Bangkok.

Messrs. C. Leary & Co. observe that for sellers the outlook continues favourable, in so far that the demand is maintained and no difficulty is experienced in placing the available supplies.

Mahogany.

This market developed little new feature during November. The imports were very moderate, and the demand quiet—though sufficient, seeing the moderate stocks on hand. African wood hardened in value, but all other descriptions can only be said to be firm at recent values.

Odessa Oak.

Next year's supplies of this wood may be disturbed by the disorder in Russia; but subject to this, the season's shipments from Odessa promise to be of the same high standard as received this year.

LIVERPOOL TIMBER TRADE.

(By our Own Correspondent.)

THE Liverpool timber trade has been active during the past month. Some kinds of wood have been neglected and deliveries have been very light, but taking hard and soft woods together good business has been done and there has been a big movement of tonnage. In spite of the much-talked-of stopping of the North American trade in builders' woods, consequent on the icing-up of the rivers, there has been no scarcity in the arrivals of such woods up to the present time, nor is there likely to be. Stocks of Canadian pine deals have been accumulating, the position of deals generally appearing to indicate a change in the field of consumption, due no doubt, so far as city buildings are concerned, to the increasing employment of steel and concrete. The new cotton exchange now being erected in Old Hall Street, Liverpool, by the Waring White Building Co., Ltd., of London, from plans by Messrs. Matear & Simon, architects, of Liverpool, is a striking illustration of this. Another instance is afforded by the new head offices of the Mersey Docks and Harbour Board, at the George's Dock, also in course of erection.

Deals.

Recent arrivals of spruce and pine deals from New Brunswick and Nova Scotia have been on a fair scale, and these woods have been in steady demand. The later arrivals have included consignments for David Roberts, Son & Co., Watson & Todd, Robert Cox & Co., Jonathan Gray and John J. Swan. An ample stock of Canadian deals is held at Liverpool, though the stock is not so large as at the corresponding date last year.

Baltic deals have come to hand in quantities which have well sufficed to maintain stocks, and values are practically without change. The total stock is slightly in excess of the stock held at the corresponding time a year ago.

Flooring Boards.

Arrivals of Norwegian boards have been on a limited scale. The demand for flooring boards has been fairly brisk, so that stocks have been reduced and values have improved.

Pitch-pine

has been in limited supply, and with a good demand stocks have been worked down, so that prices rule higher. The stock of log stuff is now much below the stock at the same date last year and still less than in 1903.

Imported Doors.

Some large consignments of framed doors have arrived and others are due. Goods of this class are now coming regularly to hand, and represent an important branch of the trade in builders' wood. Among the recent arrivals have been consignments of upwards of 2,000 and 1,000 (with larger numbers still to arrive) for Messrs. Collier & Procter; and a consignment for Mr. John J. Swan. Among other timber Messrs. Joseph Owen & Sons received a consignment of 3,000 bundles of plasterers' laths.

Oak.

The arrivals of oak have not been extensive. First-quality planks for wagon work have been in good demand, and full prices have been obtained. This class of oak has moved the most freely. Late consignments of oak have been received by Messrs. John Kendall & Co., Lytle & Pollock, R. H. Williams & Co., Joseph Owen & Sons, Ltd., and James Kennedy & Co., Ltd., most of the consignments being of plank or quartered timber.

Mahogany.

Stocks of mahogany were offered for sale by auction in Liverpool on November 16th and 17th. A large quantity of timber of current sorts was catalogued for the two days, and on the whole sold freely and well, nearly

SKETCHES IN CATALONIA, BY H. G. IBBERSON, F.R.I.B.A.
(Royal Academy Exhibition, 1905.)

1,250,000ft. of mahogany, chiefly African, changing hands. The African timber ranged in price from 2d. to 3s. 4d. per ft. super., this last-named price having been paid for some very fine Sekondi wood.

Walnut

in logs, planks and boards has also arrived in ample quantities. At the sale by auction on November 16th thirty-seven logs of walnut brought from 1½d. to 2¼d., the average being 1½d. Consignments of walnut have lately been received by Messrs. John Kendall & Co. and Messrs. Vincent, Murphy & Co.

The Liverpool Timber Trade Association is again giving attention to the old and perennial theme of the trade's relation to the Mersey Docks and Harbour Board. The Association met on November 14th, under the presidency of Mr. J. Harrison Jones (of David Roberts, Son & Co., Ltd.) and again discussed this old trade question, and considered the prospects of securing larger representation on the Dock Board in view of the probable effect of the great scheme of dock-extension at the north end of the city, with which the Board will shortly be occupied. A special committee was appointed to watch over the interests of the trade and to report to the Association as occasions may require. The Board's scheme may affect the Liverpool timber trade very favourably or unfavourably.

Hence the desirability of the trade keeping a sharp look-out over the scheme at its inception. In the election which will take place on December 20th the Association decided to support the candidature of one of its vice-presidents, Mr. J. Holford Harrison, of the firm of Harrison, Robinson & Co., of Liverpool, as representative of the timber trade, for a seat on the Mersey Docks and Harbour Board.

Saw-mill Extension.

The past month witnessed the opening of a new and modern saw-mill at Bootle. This mill, which will be known as the Titan Mill, has been erected and equipped for Messrs. Smith Brothers, who have had a mill at Bootle for some years. The new mill stands on the east side of Rimrose Road (which forms a continuation northwards of Derby Road, now the chief timber-trade artery of the district) and was designed by Mr. F. Smith, a member of the firm. It was provided to allow work to be done on the "through" principle: the logs, that is to say, will enter at one end and the sawn or manufactured timber will pass out of the mill at the other. An upper floor will be used as a bending department, and a flat concreted roof above will be used for storing and seasoning timber. The plant will include two horizontal saws (one capable of cutting a log 45ins. square), three circular saws, a 12ft. by 5ft. planing and moulding machine, with the necessary frames and accessories. The machinery has been supplied by Messrs. Thomas Robinson & Son, Ltd., of Rochdale; John Pickles & Son, of Hebden Bridge, and Evans & Martin, of Liverpool.

In connection with this matter it may be mentioned that another new saw-mill is being erected in Marsh Lane, close at hand, by J. H. Lancaster & Co.

Law Cases.

A Ladder.—At the Clerkenwell County Court recently a Mrs. Graham brought an action against Messrs. Rowe & Sons, builders, for £100 damages for personal injuries sustained by the fall of a ladder being employed by the defendants in Shepherdess Walk, City Road. It was urged for the defence that the ladder was blown down by a gust of wind, and that the accident was inevitable. The judge, however, said that the accident was clearly due to negligence of the defendants' servants, and gave judgment for £21 and costs.

Right of Light Case.—At Manchester last week, before the Chancery Court of Lancashire, a right of light case was heard. The plaintiffs, Messrs. Wigglesworth, Kennedy & Wigglesworth, are the trustees of certain offices at the corner of Booth Street and Chancery Place, Manchester, and the defendants, Messrs. J. M. Dugdale Brothers, Ltd., are the owners of a piece of land on the south side of Booth Street. On this site there formerly stood a block of offices 38ft. high, which the defendants have recently pulled down, and are erecting a new block which will be 52ft. high. The plaintiffs contended that the new building would materially obstruct the light which previously had had access to the windows of their offices over the top of the old building. In consequence they alleged that their premises

would be less fit and convenient than before for use and occupation, and that their letting and selling value would be materially diminished. They therefore claimed a perpetual injunction to restrain the defendants from acting in such a manner as to injure their property, and an order, if necessary, to pull down the new building to the height of the old one, with damages and costs. The defendants denied liability.

Claim in respect of Defective Kitchen Floor (*Cavalier v. Pope*, 2 K.B., 1905, p. 757).

—This is a somewhat important case, and interesting to many owners of property. The agent of the landlord of a house which had been let unfurnished, in consideration that the tenant withdrew a threat to quit, promised that the defective condition of the kitchen floor should be repaired. No repairs were done, and some time afterwards the tenant's wife met with a serious accident which arose from the defective flooring. An action was brought by the tenant and his wife against the landlord to recover damages and expenses incurred. The jury at the trial found the agent was acting within the scope of his authority, and the jury found a verdict for the plaintiffs, with damages in each case. Judgment was entered accordingly. The defendant, however, appealed from the judgment entered in favour of the wife. Held by Collins M.R. and Romer L.J., Mathew L.J. dissenting, that the female plaintiff had no cause of action in respect of the injuries sustained by her.

OUR PLATES.

IN this issue we are able to reproduce the design for the national memorial to Victor Emmanuel II., in course of erection on the Capitoline Hill at Rome. A full description of this huge work, the total cost of which down to the end of last year was about £750,000, will be found on page 238 of our issue for October 25th last. The monument is still far from complete, though more than twenty-five years have elapsed since the Italian Parliament decided on its erection. The design of Count Sacconi, the architect, was selected in competition in 1884. Count Sacconi, however, died in September last, and three Italian architects, Signori Pio Piacentini, Gaetano Koch and Manfredo Manfredi, have been appointed to continue his work. We need not now repeat the particulars which have already been given in our columns, but we would mention that included in the monument are a number of large chambers wherein the banners and other trophies of the *Risorgimento* will be kept. The cast of the horse is about to be founded in Rome.

The Tiergarten in Berlin, already overloaded by the Kaiser with statues of questionable artistic value, and nearly all of them monuments to persons whose commemoration is a matter of perfect indifference to the populace at large, is likely to be further stocked now that a sculptor has been appointed director of the Tiergarten.

NATIONAL MONUMENT TO VICTOR EMMANUEL II. IN COURSE OF ERECTION

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Reinforced-concrete Lintels.

A. W. D. writes: "Your correspondent 'W. H. S.' having raised a question as to the reinforced-concrete lintels described in your issue for October 18th, I should like to further trespass upon the courtesy of Professor Adams to ask if he will kindly give some further explanations of his formula for calculating the strength of these lintels. For instance, it is not clear to me why the area of the parabola for the concrete in compression is taken down to the line in the tensile reinforcements. When he says that the neutral axis in the gin. by 9½ in. beams is 2.75 ins. from the centre of reinforcement, should not the height of the parabola stop at this and the effective depth of the beam and the area of concrete in compression be calculated from this?—or, in other words, how can the concrete below the neutral axis come into and be taken account of in the compression area? Why is it not necessary to take into account the shear on these lintels? What margin of safety is allowed for in taking 500 lbs. per sq. in. on coke-breeze concrete?"

The method of finding the strength of a reinforced-concrete lintel with parabola touching line through centre of reinforcement is only approximate, and not applicable to beams where the depth exceeds the width. Its object is to avoid finding the neutral axis. The second method shown on p. 221 of THE BUILDERS' JOURNAL for October 18th was that used in calculating the Kahn system, but there was a slight omission: the formula

for finding y should be $\frac{15a + bd^2}{30a + 2bd} = 3.2$;

this will make $R = 279$ ton-inches, and with a factor of safety of 4 the safe moment of resistance should be 69.75 instead of 67.84 for the larger beam and 29.1 instead of 27.75 for the smaller beam. The Prussian regulations give the following formula for finding the distance of neutral axis from upper surface

of beam: $x = \frac{nf_e}{b} \left[\sqrt{1 + \frac{2b(h-a)}{nf_e}} - 1 \right]$

where x = distance of neutral axis from upper surface of beam, n = the ratio of the coefficient of elasticity of the steel to that of

the concrete = 15, f_e = area of steel in square inches, b = breadth of beam in inches, h = depth of beam in inches, a = distance from underside of reinforcing rods to underside of beam. Then for the 9½ ins. × 9 ins. beam given on p. 221 of THE BUILDERS' JOURNAL for October 18th

$$x = \frac{15 \times 1.5}{9.5} \left[\sqrt{1 + \frac{2 \times 9.5(9 - \frac{1}{2})}{15 \times 1.5}} - 1 \right]$$

= say 4.4 ins. from top of beam. The formula for greatest compressive stress in the concrete

$$(\sigma_b) = \frac{2M}{bx \left(h - a - \frac{x}{3} \right)}, \text{ where } M \text{ is the bend-}$$

ing moment on the beam: in the above case

$$58 \text{ ton-inches. Then } \sigma_b = \frac{2 \times 58}{9.5 \times 4.4 \left(9 - \frac{1}{2} - \frac{4.4}{3} \right)}$$

= say 874 lbs. per sq. in., which though high is not unsafe. The formula for mean tensile stress in steel (σ_s)

$$= \frac{M}{f_e \left(h - a - \frac{x}{3} \right)} = \frac{58}{1.5 \left(9 - \frac{1}{2} - \frac{4.4}{3} \right)}$$

= say 5½ tons per square inch, which is well on the safe side. With regard to the shear on the lintels, the first beam will be the more liable to fail because of the higher ratio of load to sectional area. Taking the safe shear stress on the concrete at 6½ lbs. per sq. in., which is the figure allowed by the Prussian regulations, 9.5 × 9 = 85.5 sq. ins. sectional area of beam, 85.5 × 6.4 = 5490 lbs. = 2.44 tons safe shear stress. The beam carries a distributed load of 5 tons, so that the maximum shear will be $\frac{1}{2} w = \frac{5}{2} = 2.5$ tons, which will therefore be safely taken by the concrete without taking into account the stiffening effect of the steel rods. The safe load on coke-breeze concrete of 500 lbs. per square inch gives a factor of safety of 5 or 6.

HENRY ADAMS.

Colouring on Parchment.

WALES.—INTERESTED writes: "Which is the best way to colour on parchment? Hitherto I have wetted the portion to be coloured and then applied the colour, but I think this can be improved upon."

Use ox-gall with the colours, or pounce the surface as for engrossing. See "Hints on Painting," 4d. post free from our offices.

Fungus in Shop.

R. writes: "A shop was erected several years ago, with a cellar underneath most of it. It has latterly become infested with fungus, which is not confined to the shop floor, immediately over the cellar, but is spreading upwards by the walls, which are boarded to the other floors. It cannot be for want of air, for that is well provided for, nor because of extreme dampness, as the

cellar always appears dry. Can you offer a solution and a remedy?"

The floors and matchboarding should be thoroughly ventilated; and the floor boards, joists, walls and back of matchboarding should all alike be coated with "Carbolineum Avenarius," made by Messrs. Peters, Barsch & Co.

Books for Assistant Surveyors' Examination.

TEDDINGTON.—E. J. K. writes: "Please give titles and prices of books on the following subjects for assistant surveyors' examination, Office of Works:—(1) Sanitary engineer, (2) principles and practice of valuations and easements. Books concise in treatment and reasonable in price preferred. Also, what was the date of the last examination and of the previous one?"

For sanitary engineering the standard work is Moore's "Sanitary Engineering" (30s. nett), which may be accompanied by Clarke's "Plumbing Practice" (6s. nett). For valuations use the tables in Hurst's "Architectural Surveyors' Handbook" (5s.) and read Curtis's "Valuation of Land and Houses." For estimating, study Rea's "How to Estimate" (7s. 6d. nett); for easements, Innes's "Digest of Law of Easements" (7s. 6d.). The dates of previous examinations can only be found by a special search.

HENRY ADAMS.

The Theatre of Marcellus at Rome.

LONDON.—DARK HORSE writes: "Where can I find a good description and plan of the theatre of Marcellus at Rome?"

The best description of the theatre of Marcellus is contained in a book entitled "Le Theatre de Marcellus à Rome," by A. L. T. Vandoyer, and published in Paris in 1812. Some very fine drawings of this subject are given in "Architettura Antica Romana, Descritta e Dimostrata nei Monumenti," by Luigi Canina, and published in Rome in 1834. Brief descriptions will also be found in many modern works, such as I. H. Middleton's "Ancient Rome," &c. All these works will be found in the library of the R.I.B.A.

H. Y. M.

Board of Education Examinations.

LONDON.—X. writes: "Where can I get particulars and syllabus of the examination in architecture, and honours (Part II.) building construction examination, held under the Board of Education, South Kensington?"

Apply to the secretary of the Board at South Kensington.

Buildings to Measure near Barnsley, Wakefield and Leeds.

BARNSELY.—T. B. writes: "Please name some architectural subjects suitable to measure for the Intermediate R.I.B.A. between and about the towns of Barnsley, Wakefield and Leeds."

The cathedral at Wakefield contains work

Width of New Street.

ST. ALBANS.—S. D. E. writes: "With reference to the accompanying plan of a building site for sale in a country town having urban powers, (1) could the local authorities insist on the road marked A being widened to 36ft., having regard to the fact that it has been laid out as a road for some years although never used as such, and has not been taken over by the corporation? I am not sure whether plans for this were submitted to the town council or not. (2) In the event of this being the case, I presume the width would be taken as 18ft from the centre of the roadway each side. One end of the roadway is open, but the other is blocked by a gate which is kept locked. There is, however, room enough for foot passengers to get through. (3) Is it possible by arrangement with the various adjoining owners to throw part of the present roadway A into plot B, leaving, say, a foot path next to property C as far as plot B extends or throughout the length of road A? I might add that my clients require to build one house only on the plot."

The local authorities can insist on any new street being laid out to the width of 36ft., in accordance with the by-laws, but I much doubt whether this is a new street; and if, as I suppose, the land marked "various owners C.," on your sketch consists of houses facing the A road, I am of opinion you may fairly claim that the by-law does not affect this case. (2) Not necessarily 18ft. each side of present centre. A new street must be 36ft. wide in all—however that width has to be obtained—and if the opposite owner refused to give any land you would have to widen it entirely on your side. (4) This entirely depends on the question of "dedication," and forms a rather abstruse question for a solicitor's opinion. The fact that the gate is there and has been locked is in your favour, but that is only one of the points for consideration. If you propose to enclose part of the roadway, I seriously advise you to take competent legal advice before doing anything. F. S. I.

Camera Obscura.

ACTION.—H. C. C. writes: "I am preparing plans, &c., for a rifle club pavilion, and am requested to arrange for a camera obscura to be fixed on the roof. Do you know of any book giving a detailed description and illustrations? Can you name any firm to whom I might apply for particulars and an estimate? Has the lens to be focussed for any definite object?"

A general description of a camera obscura may be found in many books, such as on p. 126 of Spencer's "Sound, Light and Heat" (Percival & Co.). The focus of the lens is constant. Messrs. Casella & Co., of 147, Holborn, E.C., would probably give you an estimate, and supply the lens and mirror complete. HENRY ADAMS.

Concrete Floor.

SALOP.—BEGINNER writes: "I intend to lay a concrete floor (cellar under) with rolled steel joists and a covering of wood blocks. What size H-section would be required for the dining-room floor, which measures 15ft. by 12ft., and what distance apart should the joists be? Also, what would be the approximate cost?"

WROTH IRON ROOF TRUSS

This room is very small to have a special construction of floor, and nothing is said about provision for carrying the rolled joists, position of fireplace, &c. Assuming that this can be satisfactorily arranged, the rolled joists, with a span of 12ft., may be 5½ ins. by 2 ins. by 10½ lbs. per foot run, placed 2ft. 6 ins. centre to centre, with Portland cement concrete, 1 to 4, carefully mixed and rammed to the same depth as the joists. The cost would depend entirely upon whether the work were done by a local builder or by specialists. It might perhaps be done for 7s. 6d. per yd. super., the centering and wood-block flooring being extra, also any work in trimming round fireplaces. HENRY ADAMS.

Building Line.

HECKMONDRIKE.—EXLEY writes: "Referring to the sketch below, A is the owner by bequest of certain buildings (date of erection uncertain) whose external walls run x v y.

There is a spout (shown by dotted lines) projecting 6 ins. from the wall face, and certain windows, marked 1, 2 and 3. B buys the adjoining field on the west, and may not build within 15ft. of A's boundary. (1) In the absence of any definite plan or agreement making it indisputable, from what point is the 15ft. measurable—from the building face x, v, y, or from the overhanging spout? (There is no set-on in the wall base; the spout overhangs bodily.) (2) Should the 15ft. line be drawn parallel to x v y and v y, miting at w, or should an arc o z q be struck at 15ft. radius from v? If from the former, then A secures more than 15ft. from the point v and B suffers accordingly.

(1) "Within 15ft. of A's boundary" your question says, and if this be the correct wording of the deed B cannot build within 15ft. of any part of A's property, whether the nearest point consists of footings or spout. The exact wording of the deed or covenant must, however, govern the case. (2) I cannot say that either method is correct. It appears to be clear that no part of B's building can be nearer than 15ft. from A's boundary, and provided he does not infringe that rule he may build as he chooses. The whole matter appears to be a mere "splitting of hairs," and I advise B to be reasonable and to keep fully within his own land. F. S. I.

Sizes of Members for Iron Roof Truss.

LONDON.—ENQUIRER writes: "The stresses on the accompanying diagram having been obtained graphically, how are the signs of the members calculated? My own working-out brings the sizes much above those given by Hurst."

The tables of scantlings given in Hurst's "Architectural Surveyors' Handbook" are based upon a factor of safety of 4 to 5, while the formulæ given on p. 47 are recommended to be used with a factor of safety of 10, but there stated as $\frac{1}{10}$, meaning working load $\frac{1}{10}$ of ultimate strength. If all known contingencies are allowed for, a factor of safety of 4 is sufficient for iron roofs. Box, in "Strength of Materials," even says 3 is sufficient. HENRY ADAMS.

Finding Centre Lines of Truss Members.

PLYMOUTH.—CONSTANT READER writes: "(1) How can I obtain the centre line of pressure in the members of an iron roof truss similar to that shown in one of Mitchell's sheets on building construction? On this sheet the line is shown 1775 ins. up from the lower edge of the T-principal, and all bolt-holes are made on this line. (2) Is there a sheet which can be copied as a testimony of study for R.I.B.A. Final to suit the one on constructive masonry in arches, vaults, &c.?"

Roof trusses and trussed girders should as far as possible be designed so that the lines through the centres of gravity of the cross-sections intersect at each junction and lie in the same plane. This cannot always be done, but it is an important principle to bear in mind, and is the only way to ensure direct stresses. The centre of gravity of a

T-section, as shown in sketch, is found by the formula $y = \frac{1}{2}d + \frac{\frac{1}{2}BDT}{BT + dt}$. (2) For example sheets of testimonies of study, apply to Mr. G. A. T. Middleton, 19, Craven Street, Strand, W.C. HENRY ADAMS.

A new Theatre for Dover is to be built at the rear of the Metropole Hotel and fronting New Street.

NOTES ON COMPETITIONS.

The Hackney Library Competition.

THE unsatisfactory nature of the promoters' official list of replies to competitors' questions was commented upon in these columns last week. In order to obtain, if possible, some elucidation of the points raised, a communication was addressed to the town clerk, asking:—(1) Did the Council intend to employ the successful competitor? (2) Had the president of the R.I.B.A. been asked to nominate an assessor? (3) Was not the reference to clause 4 of the conditions an error, and should it not be read as referring to clause 5? This last question, it will be remembered, was commented upon last week under the heading of "The Question of Fees," when it was pointed out that clause 4 of the conditions dealt with premiums, and not with the remuneration of the successful competitor if employed to carry out the work. The town clerk has replied: "(1) This is a matter in the discretion of the Council. (2) Not yet. The president will be asked to nominate an assessor after designs have been received. (3) The answer to question 2 should read as referring to paragraph 5 of the conditions, not to paragraph 4 as stated." Thanks are due to the town clerk for the ready manner in which he has furnished these replies, and for his reception of the enterprising competitor whose interview with him we recorded last week. This is a matter for comment and pleasurable record, when one calls to mind the instances where reasonable requests for information have been, in other cases, either treated evasively or with apparent contempt. It goes somewhat towards mitigating the uneasiness which lack of official information has caused, and it raises the hope that the verbal statement may perhaps be relied upon, namely, that there is "no reason to suppose that the Council intend to adopt any but the usual course."

One can quite understand the unwillingness of promoters to bind themselves to engage the services of an architect who might be an undesirable person—a most unlikely contingency; but had the assessor been appointed, as he should have been, before the conditions were issued, he could have shown the Council of Hackney how they might have guarded themselves, while they at the same time gave competitors a reasonable hope of being fairly dealt with. From all accounts the competition is being indulged in by many whose names are well known in connection with these architectural trials of skill, so all who are entering the lists may know that they are at least in good company.

Birmingham Council House Extension.

This double competition is now advertised. It is the biggest thing since Westminster, but the cost is not to exceed £150,000. The names of Sir Aston Webb, R.A., and Mr. E. Ingress Bell as assessors suggest an approximation to the much-desired jury of assessors, but their long association with each other in matters professional leads one to anticipate that they are likely to act as one man, though two heads are sometimes better than one. It is a pity that in a competition of this magnitude it was not possible, through the intervention of Sir Aston Webb himself and the R.I.B.A., to have arranged for the appointment of at least one other assessor, so that a full jury might have been formed in accordance with the R.I.B.A.'s latest suggestions for the conduct of competitions.

New Council Schools, King's Norton.

The Education Committee of the King's Norton and Northfield Urban District Council has issued an invitation for competitive designs for a new council school of three

departments, to accommodate 400 scholars in each department, boys, girls and infants. There is to be a professional assessor, but further information is not forthcoming at the time of going to press, for the conditions are still in the printer's hands. They will be obtainable from Mr. J. F. Moore, Education Offices, King's Norton, near Birmingham.

Proposed new School, Wrexham.

Wrexham is to have a new school at a cost of £10,000, and it has been decided to offer premiums of £50 and £30 for the best plans. It is to be hoped that Wrexham has already given its instructions to a reliable assessor or assessors, and that it is the intention to employ the successful competitor. The conditions, like those of King's Norton, are not available; possibly they have not yet been drawn up.

Hove Public Library.

The following letter has been received by ten of the competitors in this competition, which excited so much comment a few weeks ago:—

Borough of Hove.

Public Library Competition.

DEAR SIR,—I now beg to inform you that out of the seventy-one designs sent in, ten were selected for further consideration, and that on opening the sealed envelopes of these ten it is found that the design sent in by you is one of them.

The Library Committee propose to invite the authors of these ten selected designs to compete again.

I have, therefore, to enquire whether you will be willing to do this; if so, I will return your designs for that purpose.

Print of conditions, which will be settled by Mr. John Belcher, P.R.I.B.A., will follow so soon as they are ready.—Yours faithfully,

(Signed) H. ENDACOTT,
Town Clerk.

It is satisfactory to learn that, so far, the deadlock has been eased, but surely it would have been better to have given the selected ten an opportunity of seeing the new conditions before expecting them to state whether they would be willing to compete again. Further comment is out of place until the assessor's conditions for the new competition have been issued.

Competition for the Usher Hall.

At last week's meeting of the Edinburgh City Council there was a resolution on the agenda that competitive designs should be invited for the long-talked-about Usher Hall. This, however, was postponed until the town clerk's full report on the subject had been received.

Peace Palace Competition.

The term of seven months determined in article 2 of the programme of the Peace Palace competition has been extended to eight months. According to this, the plans must be in the possession of the Board of Directors of the Carnegie Foundation at the Hague (Van Karnebeek, chairman; S. Van Citters, secretary) before April 15th, 1906.

Henry Saxon Snell Prize.

Thirty-one essays on "Domestic Sanitary Appliances, with Suggestions for their Improvement," have been received by the Royal Sanitary Institute for the Henry Saxon Snell prize. Not one of the essays, however, is considered worthy of the prize, which consequently is withheld. The essayists give a good description of existing appliances, but fail in respect of suggestions for their improvement, which is the governing factor in the competition.

Extension of Mirfield Grammar School.

The design of Mr. J. Lane Fox, of Oxford Place, Leeds, has been awarded the first premium in the competition for an extension of the Mirfield Grammar School, for the Governors.

A Plymouth Competition.

It is proposed to erect a new public elementary school at Prince Rock, Plymouth, and it was suggested that a competition should be held confined to architects practising in the Three Towns. The committee, however, decided that this would be open to abuse, and decided to restrict the competition to Plymouth architects.

Correspondence.

Hackney Central Library Competition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—It would be a practical solution of the much-disputed assessor question if in the above and in future competitions the competitors could, through the president of the Royal Institute of British Architects, select a competent gentleman with the special knowledge necessary and a past experience of successful adjudications. Each of the competitors could send to the Institute the names of three architects with such qualifications, and the president would hand over the delicate task to the individual securing the most votes. This would remove the responsibility from this much-maligned official and save him from the temptation of doing his friend Jones a good turn, irrespective of professional knowledge.

What architects want is to be saved from the hands of the incompetent assessor. If the competitors nominated their own adjudicator they would surely protect their own interests. They could guard their future competitions if the assessor managed to get lost among the drawings and in despair took the three poorest sets sent in, as we have seen done lately; in which case his name would be so well known in the offices as to place him on the architectural black list.

To anyone conversant with public competitions it seems as if the assessor has been too often appointed because of his lack of knowledge of the requirements in the building he is called upon to assess. Numerous mistakes have been made by past-presidents of the Institute when libraries have been assessed by architects well known as specialists in church and domestic work only.

The foregoing suggestion would work better in practice than the present slack, favoured and routine method, as the remedy is in the competitors' own hands. Just one instance as proof that members are not yet blind to their own interests. A year or two ago the late architect to the London County Council assessed in the Hereford Municipal Buildings competition, which ended in a miserable fiasco. Immediately afterwards this same gentleman was appointed assessor in the Hull Town Hall competition, and when the competing architects found out who was adjudicating they failed to respond to the invitation in the face of good premiums. It had the desired effect of making the Hull Corporation appoint another assessor. The assessor should not be known to the competitors until after the designs have been submitted, as of late there has been a certain amount of pampering to the artistic fads and peculiarities of the architect whenever his name has been known beforehand. In this connection I would cite the first-premiated design for the Cheshunt Free Library, published recently in THE BUILDERS' JOURNAL. In this competition Mr. J. S. Gibson was the assessor, and the exterior of the successful scheme was strongly reminiscent of Mr. Gibson's own design for the Hull Free Library, both in detail and grouping. If competitors selected their own assessor this evil would be lessened, as there would be no need of the name being disclosed till after the award was made and the report published in full—as it ought to be, and that within two months from the sending-in day.—Yours truly,

W. EDWARDES SPROAT.

LIVERPOOL.

A Rowton House at Camden Town, fronting Arlington Road, was opened last week. The building has been erected by the company's own staff under the direction of Mr. G. J. Earle, surveyor, and to the designs of their late architect, Mr. Harry B. Measures, F.R.I.B.A., now Director of Barrack Construction.

PRESTON SECONDARY SCHOOL.

THE following are the particulars of the proposed secondary school for girls at Preston supplied to us by the architects, Messrs. Woolfall & Eccles, of Liverpool. The design was illustrated in our issue for last week:—

This building is divided into two departments by a corridor 12ft. wide running from north to south the full width of the building. On the east side of same is the central hall, with classrooms, laboratory, lecture-room, sixth-form room, &c. On the west side are the headmistress's and assistant mistress's rooms, with their lavatories, small office and store, scholars' cloakroom, space for changing, caretaker's room and main staircase. An auxiliary staircase is also provided. On the upper floor over this portion are the kitchen, scullery and dining-room, and over the scullery the music and practice rooms. The entrance to the school is from Moor Park, and an exit is provided to St. Thomas's Road. In the basement a playroom is provided with storage for bicycles. The approach is from the playground down an inclined way, and also from the ground floor under the main staircase, and leading out of the covered way from the school to the yard, so that scholars can reach same in bad weather without going outside the building. The heating is also provided for in the basement. On the first floor are five separate classrooms, exclusive of the cookery-room and art room. This latter has a north light. The wide corridor is repeated on this floor, and will be suitable for exhibits. It also disconnects the cookery and dining-room, &c., from the other part of the school. At the south end of the corridor is a small conservatory. The w.c.'s are on the St. Thomas's Road side, kept back from the road, approached from the playground and also from the school under cover through an arcaded corridor. The playground is on the west side.

Trade and Craft.

Gas Heating.

No doubt it is the experience of the majority of our readers that the ordinary gas fire often has the great objection of emitting noxious fumes. Therefore a flue is generally insisted upon to carry off the products of combustion. This however means that the gas fire loses its efficiency, because it is an established fact that air is not warmed by radiation but by convection or conduction. Convected heat is the chief source of warmth, and is that kind which is conveyed from one place to another by the actual transference of the heated substance, such as heated air. Air only becomes heated by contact with heated particles or heated surfaces, and thus radiant heat from an open fire only warms a room by warming the furniture or walls and using them as an intermediary. In the gas fire with flue the radiant heat is not very much. The gas fire gains its real efficiency by warming the air by contact with the heated products of combustion, i.e., by convection. For this to be done it means that there must be no smell due to the incomplete combustion of the gas, and only by doing without a flue can we gain economy in gas heating. The "Omega" gas stove has the advantage of securing perfect combustion, which renders it odourless (as is testified by many authorities) and requires no flue; and these stoves have the additional advantages of not drying the air and not "roaring" as other stoves do. There are many circumstances where flues cannot be adopted, and heating is nevertheless required at times. Here these stoves offer a solution of the difficulty. They are made by The Omega Odourless Gas Stove Co., Ltd., of Cave Street, Bristol.

Keystones.

Architects' Benevolent Society.—In relief this year £842 has been distributed.

Hammernsmith Workhouse and Infirmary.—Mr. Thomas Rowbotham, of Birmingham, was the contractor for this large scheme, of which some particulars were given on p. 330 of our issue for last week.

The Institute and Registration.—Early next year it is hoped to call a special meeting of the Institute to receive the report on registration drawn up by the council and the registration committee.

Stained-glass Studio at Hove.—Mr. E. E. Oldacre, formerly in responsible positions with Messrs. Henry Hope & Sons, Ltd., and earlier with Messrs. Walter J. Pearce, Ltd., is now established at Stirling Place, Hove, Sussex, where he has studios for the preparation of stained and leaded glass and similar decorative work. The style of the firm is "E. E. Oldacre & Co."

Extension of the Building Act.—From the report of the Building Act Committee submitted to the London County Council yesterday it appears that the Amendment Act passed this year, which comes into operation on January 1st, will require about 10,000 buildings to be dealt with, and a rearrangement of the superintending architect's department will have to be made in order to cope with the extra amount of work entailed. Several assistants are to be advanced.

Messrs. Waygood's Athletic Association Dinner.—At the London Tavern in Fenchurch Street on Saturday evening there was a very large and enthusiastic gathering to celebrate the eighth annual dinner of the Athletic Association of Messrs. R. Waygood & Co., Ltd., the well-known lift firm. An attractive programme was provided, and under the chairmanship of Mr. R. Percy Sellon (and subsequently of Mr. D. W. R. Green) a most enjoyable evening was spent. During the evening the prizes won in the course of the season were presented by the chairman, who was able to announce that the Association had been able to secure a private ground for cricket, football, tennis, &c.

Collapse of a Wall at Croydon.—On Tuesday last week a wall of the new Palace of Varieties in course of erection at Croydon collapsed, killing one man and injuring nine others. The music-hall is being rebuilt, and the outer walls of the original structure were left standing to be embodied in the new work. It was one of these old walls (32ft. high) which fell, having collapsed at a point about 15ft. above the ground where chases had been cut in the brickwork to receive a girder. In falling the old wall struck a new wall running parallel to it at a distance of about 6ft. and caused a part of this to fall also. The contractor for the work is Mr. Walter Wallis, of Balham. At the inquest the jury returned a verdict of accidental death, adding that it was to be regretted more precautions in the way of shoring up had not been taken.

Royal Academy Students' Prizes.—The Royal Academy gold medal and travelling studentship (value £200) for a design for a British embassy in a foreign capital is won this year by Mr. Leslie Wilkinson, who also secures the price of £25 for a set of architectural designs. Measured drawings (silver medal), 1st, A. A. Carter; 2nd, A. E. Brooker. Set of drawings of an architectural design, 1st (£15), A. A. Carter; 2nd (£10), W. Harvey. Design for the decoration of a portion of a public building—"Commerce"—prize £40, J. H. Amschwartz; honorable mention, C. A. C. Oliver Lodge. The prizes offered for perspective drawing in outline and for architectural design with coloured decoration were not competed for.

R.I.B.A. NOVEMBER EXAMINATIONS.

Pass List.

THE following is the pass list in the Preliminary, Intermediate, and Final Examinations of the Royal Institute of British Architects which were held in London and the provinces in November:—

Preliminary Examination.

This examination, qualifying for registration as probationer R.I.B.A., was held in London and the undermentioned provincial centres on November 7th and 8th. Of the 210 candidates admitted, 46 claims for exemption from sitting for the examination were allowed. The remaining 164 candidates were examined, with the following results:—

District.	Number examined.	Passed.	Relegated.
London	82	67	15
Birmingham	5	2	3
Bristol	3	6	2
Cardiff	14	12	2
Leeds	17	12	5
Manchester	24	13	6
Newcastle	14	11	3
	164	128	36

The following passed candidates, with those exempted—numbering altogether 174—have been registered as probationers:—

A. Adam (Paisley)	G. V. Hawker (Bournemouth)
C. A. Aish (Kingston-on-Thames)	J. Hayhurst (Blackburn)
E. M. Armstrong (Pretoria)	G. E. Hedley (South Shields)
C. F. Bailey (Walsall)	G. M. Hedley (Cullercoats)
A. L. Ball (Birmingham)	J. Hill (Newcastle-on-Tyne)
B. V. Bartholomew (Walthamstow)	G. W. Home (London)
F. C. Barrett (N. Finchley)	H. R. Hooper (Ipswich)
F. K. Barry (Richmond)	J. H. Horniman (St. Leonards)
A. Berrington (Birkenhead)	L. W. Ingham (Leicester)
H. C. Berry (London)	E. R. Jarrett (London)
J. A. Bessant (London)	B. Johnston (Plymouth)
W. S. Beits (Clapham)	J. Johnston (Longtown)
H. D. Blacker (Clifton)	F. S. G. Judd (Windsor)
H. Blenkinsop (Sheffield)	C. S. Kimpton (Wandsworth)
H. Boddington (Wilmslow)	A. Lakeman (London)
G. Boshier (Merthyr Tydfil)	G. Law (Ware)
C. W. Box (Beeston)	C. H. Ledger (Epsom)
D. W. Boyd (Belfast)	A. J. Lee (London)
A. G. Brace (Knowle)	W. L. B. Leach (Ipswich)
J. S. Bray (Exeter)	S. T. Leete (Weston-super-Mare)
W. J. Burton (New Cross)	G. E. G. Leith (London)
C. F. Butt (London)	W. J. Lewis (Ferndale)
R. W. Cable (Brixton)	L. S. Littlejohn (Eccles)
C. S. Cameron (Aberdare)	B. H. Lodge (Putney)
F. E. Cannon (Lincoln)	P. N. Logan (Bristol)
G. R. Carter (Leicester)	W. H. Louw (London)
W. Carter (Sunderland)	C. E. Lovick (Crowthorne)
H. F. Castle (London)	A. M. Lusby (Fareham)
E. S. Chivers (Amphill)	D. R. Lyne (Cheltenham)
R. Church (Glasgow)	D. McLean (Corbridge-on-Tyne)
A. N. Clark (Southsea)	L. D. Maddox (Llanishen)
W. L. Clark (Petersfield)	B. F. Matthews (London)
W. E. Clarke (Ewell)	R. H. Mattocks (Windermere)
C. F. Clarkson (Kensington)	J. W. Mawson (Windermere)
W. H. Clough (Gateshead)	H. G. McCoy (High Wycombe)
A. J. C. Cooper (Henfield)	D. L. Meckleham (Hamstead)
L. L. Corkhill (Ramsey)	S. Mercer (Blackburn)
F. L. Crampton (Newark)	H. J. Midson (Crouch End)
H. A. Crooke (Acton)	S. E. Minns (Hull)
L. A. Culliford (Ealing)	H. E. Moore (Ealing)
K. Dalglish (London)	F. W. Moore (Keighley)
C. T. Davidson (South Shields)	C. J. Moorehead (Manchester)
G. S. Davies (Swansea)	E. E. Morgan (Crouch End)
V. R. Davis (Aberdare)	H. J. Murphy (Cork)
D. J. S. Dawson (Barking)	A. E. Newbound (Newark)
W. Dean (Lewisham)	W. W. Nimmo (Gosforth)
F. Dowdeswell (Palmer's Green)	A. T. Nicholson (Bolton)
G. S. Dransfield (Barnsley)	W. H. Ogden (Wakefield)
H. Dye (Portsmouth)	G. Parkinson (Burnley)
D. N. Dyke (London)	T. L. Pearce (London)
E. H. M. Ebbs (Harsleden)	A. N. Peckham (Westminster)
W. F. Edge (Edgbaston)	R. M. Pigott (Wandsworth Common)
J. A. Emes (Balham Hill)	F. C. Plummer (Liverpool)
A. E. Evans (Ferndale)	F. W. Pocock (Egham)
W. H. Fielding (Cardiff)	J. J. Price (Clifford)
E. Fillingham (Bradford)	L. M. Pritchard (Beaumaris)
G. W. Filliter (Higher Broughton)	W. S. Putwin (East Dulwich)
N. Fisher (Leeds)	O. B. Raven (Gainsborough)
A. Forbes (Reading)	R. G. Rice (Derby)
G. S. Ford (Nottingham)	H. E. Richards (Ilford)
G. Forsyth (London)	V. Rienecker (Kensington)
W. S. Foster (Hull)	H. Roderick (Aberdare)
W. T. Garbutt (Bradford)	M. S. Rogers (Flint)
R. E. Gaskell (Hull)	W. Royde (Stoke-on-Trent)
W. W. Gibbins (Reading)	G. H. Russell (Hitchin)
A. Gibbs (Moseley)	
S. Grabbam (Sunderland)	
M. A. Hall (Lincoln)	
F. M. Hammond (Bradford)	
H. Harper (Handsworth)	
J. S. Harrison (Bolton)	
J. C. Harvey (Northampton)	
W. H. Hattersley (Cambridge)	

E. P. P. Samuels (Llan-fairfechan)	E. J. Thomas (Maesy-cwmmer)
E. Sanders (High Wycombe)	W. H. Thompson (Blackpool)
S. P. Schooling (Enfield)	R. J. Thomson (Arbroath)
E. W. B. Scott (Norwich)	G. L. Thorne (Southampton)
B. W. H. Scott (Enfield)	A. Tinker (Pendleton)
C. J. G. Seddon (West Hampstead)	A. T. Tippetts (South Woodford)
A. E. Shapley (Newcastle)	A. E. V. Tutte (Portsmouth)
R. H. Simmons (Southampton)	A. E. Vey (Chiswick)
T. A. Skinner (Bristol)	D. H. Walker (Bridlington)
C. V. Smith (Tunbridge Wells)	S. P. Walker (Newark)
S. Smith (West Hartlepool)	A. Waller (Bradford)
C. L. Souster (Gorleston)	F. G. Walmsley (Blackburn)
F. D. Sowerby (London)	R. Williams (Menai Bridge)
P. N. Steadham (Fareham)	G. S. Wodeford (Tilehurst)
F. H. Swindells (Hampstead)	F. Woodward (Hampstead)
M. J. Tapper (London)	F. C. Wyld (Clapham)
A. P. Thomas (Bridgend)	O. Wyn (Port Dinorwic)
	W. C. Young (Heaton Moor)

The Intermediate Examination.

qualifying for registration as student R.I.B.A., was held in London and the under-mentioned provincial centres on November 7th, 8th, 9th and 10th. 131 candidates were examined, with the following results:—

District.	Number examined.	Passed.	Relegated.
London	82	37	45
Bristol	9	6	3
Leeds	19	8	11
Manchester	21	14	7
	131	65	66

The passed candidates, who have been registered as students, are as follows, the names being given in order of merit as placed by the Board of Examiners:—

J. R. Truelove (Sheffield)	J. W. Hays (Wingate)
R. I. Smith (Weston-super-Mare)	G. A. S. Atack (Blackburn)
W. R. Dawson (Halifax)	P. S. Brenton (Bath)
W. T. Benslyn (Oldbury)	R. G. Burrow (Old Trafford)
J. Woolatt (Wiltord)	A. E. Catt (Kingston-on-Thames)
C. V. Hodges (Leicester)	J. H. Chaudler (East Sheen Avenue, S.W.)
H. V. M. Emerson (Chiswick)	R. R. Christen (Bolton)
R. Evans (London)	F. J. Coghlan (Cheltenham)
E. Ainsworth (Blackburn)	K. L. Collingwood (Richmond)
C. B. Metcalfe (Bradford)	R. A. Dixon (Birmingham)
F. D. Thomson (Dundee)	R. K. Ellison (Huntingdon)
C. G. Boucher (London)	J. R. Goulston (Sydenham)
F. H. Bromhead (Harrow)	J. B. Healing (Hampstead)
J. F. Schofield (London)	H. W. Higson (Bolton)
F. Wade (Bradford)	G. H. Jones (Cardiff)
E. G. Allen (S. Woodford)	G. G. King (Belfast)
C. Bristow (W. Norwood)	D. C. Leigh (Winstord)
J. Allner (Manchester)	T. C. Little (Carlisle)
H. C. Anderson (Heywood)	W. P. Major (Bristol)
F. J. Osborne (Birmingham)	A. C. Meston (Chiswick)
H. E. Dicks (Cheltenham)	C. Oldrey (Plumstead)
S. W. Mobbs (Oulton)	T. M. Richards (Barnes)
D. Whittaker (St. Helen's)	B. H. T. Rodd (Winton, Bournemouth)
C. E. Curphey (Douglas)	J. W. Snaft (Petersfield)
E. J. Scaife (Bolton)	H. N. Smith (Lewisham Hill)
A. Braewell (Keighley)	G. Unsworth (Petersfield)
F. D. Ward (Hasings)	A. Wheatley (Barnsley)
E. Finn (Canterbury)	H. J. Wilson (Peterborough)
J. H. Willman (Wellingborough)	J. D. Winder (Wandsworth Common)
J. Davaston (Ealing)	E. M. Wood (Halifax)
C. E. Hanscomb (Ladywell)	A. M. C. Young (London)
C. H. Hoy (Manchester)	
W. G. Shaw (Blackburn)	
D. S. Gardner (Weston-super-Mare)	

Exemptions.

Mr. H. H. Hill, of Cork, and Mr. H. Thornton, of Dewsbury, probationers, having attended the full course in architecture at University College, Liverpool, and having obtained a first-class certificate at the College Final Examination, were granted exemption from sitting for the Intermediate Examination, and have been registered as students R.I.B.A.

The Final and Special Examinations.

qualifying for candidature as Associate R.I.B.A., were held in London from November 17th to 24th. Of the 90 examined, 45 passed, and the remaining 45 were relegated to their studies. The successful candidates are as follows:—

*A. W. Addison (Cambridge)	F. Dyer (Manchester)
A. D. Aitken (Airdrie)	T. S. Fraser (Hamilton)
J. H. de Caynoth Ballarrie (London)	*W. C. Green (London)
A. F. Benjamin (London)	E. L. Hampshire (Streatham)
J. Boyle (Bolton)	G. Hanson (Bradford)
J. E. Braithwaite (Leeds)	*C. H. Holden (Weymouth)
S. Bridges (London)	*A. Hunter (Colwyn Bay)
A. E. Bullock (Chiswick)	A. H. Lamont (Edinburgh)
*M. Bunney (London)	*L. W. C. Lorden (Hythe)
J. Cocker (Altrincham)	W. P. Marr (Kingsbridge)
T. T. Cumming (Reading)	W. K. McDermott (London)
E. J. Dixon (Staitford)	D. Mitchell (London)
B. Drummond (London)	*H. A. Moon (London)
	G. Morland (Croydon)

H. S. Morran (London)	J. H. Shearer (Exeter)
*A. R. Myers (Edinburgh)	P. M. Stratton (Upper Mitcham)
A. C. Noley (London)	J. R. Sykes (London)
D. M. O'Connor, B.A., B.E. (London)	*P. Turner (Bradford)
*A. J. Peyton (Welling)	*M. O. Type (Birmingham)
S. C. Ramsey (Herne Bay)	R. F. Wheately (Bromley)
W. H. Riley (Leicester)	E. C. M. Willmott (London)
H. Ryle (Brookley)	L. S. Wood (Wood Green)
*D. A. Shaw (Camden Road, N.W.)	H. E. Woodsend (Nottingham)

The following table shows the number of failures in each subject of the Final Examination:—

I. Design	31
II. Mouldings and Ornaments	22
III. Building Materials	12
IV. Principles of Hygiene	6
V. Specifications	11
VI. Construction: Foundations, &c.	11
VII. Construction: Iron and Steel, &c.	19

Colonial Examinations.

Final and Special Examinations were held by the Institute during July last at Sydney, New South Wales, and at Durban, South Africa. The examination at Sydney was conducted by the Institute of Architects of New South Wales, and the examination at Durban by the Natal Institute of Architects. Mr. E. A. Agutter, of Pietermaritzburg, and Mr. *J. Barr, Public Works Department, Sydney, were examined and passed.

* These candidates entered for the Special Examination, which is for architects in practice not less than twenty-five years of age, and chief assistants over thirty. Such candidates are exempted, by special resolution of the Council, from the Preliminary and Intermediate Examinations, and from submitting "Testimonies of Study."

Obituary.

Mr. James Green, F.S.I., of the firm of Weatherall & Green, surveyors and auctioneers, of 22, Chancery Lane, London, died last week. During a practice extending over a period of forty-six years Mr. Green acted as one of the consulting valuers to the Government, the Corporation, the London County Council and many other public and private corporations and companies in London and the provinces.

Mr. John Weller, senior partner in the firm of John Weller & Sons, architects and surveyors, Wolverhampton, died on November 27th, in his seventy-sixth year. He served his articles with the late Mr. Edward Banks, of Wolverhampton, and afterwards spent some years in London, commencing practice in Wolverhampton fifty years ago and continuing to take an active interest in the firm up to the time of his death. For the past thirty-three years he held an appointment as surveyor to Earl Dartmouth, Patshull Estate, and for the past twenty-seven years as surveyor to the Wolverhampton and District Permanent Building Society. Mr. Weller never took any active part in public life, but was very well known and highly esteemed. He leaves a widow, daughter and two sons.

Mr. H. H. Armstead, R.A., the well-known sculptor, died last week, aged 79. His two most important works were the sculptured decorations on the Colonial Office in Whitehall and the southern and eastern sides of the podium of the Albert Memorial; for the latter he designed eighty-four life-sized figures in marble, representing the musicians, poets, sculptors and painters of the Italian, German, French and English Schools, and other "ideal" statues. He did the external stone sculptures at Eaton Hall, Warwickshire, the carved oak panels in "The Queen's Robing Room" at Westminster Palace, the marble rétrods in Westminster Abbey, the great fountain in King's College, Cambridge, the statue of Lieut. Waghorn at Chatham, and numerous statues and busts. "His work had monumental character and simplicity, and will always be remembered as belonging to the front rank of British sculpture," says Mr. M. H. Spielmann.

CITY OF LEEDS.

PREPARATORY TRADE DAY SCHOOLS.

The Higher Education Committee propose to OPEN, early in 1906, at the Woodhouse Mechanics' Institute, a PREPARATORY TRADE DAY SCHOOL for Boys, Apprentices, and Artisans.

The object of the School is to give an introductory knowledge of the principles and practice of various trades, but especially of the Building and allied Trades. Applications for the post of HEAD MASTER are invited from persons with practical experience and with teaching qualifications for such work.

Salary commencing £200 per annum. Applications, stating full particulars with regard to experience and qualifications, should be received by the undersigned not later than 9 a.m., on December 31st, 1905.

JAMES GRAHAM,

Secretary for Higher Education.

Higher Education Department,
Leeds, December, 1905.

A GENTLEMAN with some experience in Warming and Ventilating Buildings is required to join an old-established and going business, with good modern works in London—Capital £1000 or over—for purposes of extension.—Box 13,236, CLARK'S ADVERTISING OFFICES, 49, Great Portland Street, W.

THE LONDON DRAWING & TRACING OFFICE, (Estd. 1883.) 98, Gray's Inn Road, W.C. (Adjoining Holborn Town Hall.)

Telephone. No. 1011 HOLBORN. Manager—JOHN B. THORP. Telegrams: "DIVIDITORE," LONDON.

Notice to Advertisers.

"We wish to say that our advertisement in your valuable paper has brought us a large number of new customers and still increasing. We have now opened a Railway Depot to deal with the Stone trade."

The above is an extract from a letter received on the 27th November last from a firm who have regularly advertised in the "Builders' Journal" for the past two years, and which proves in unmistakable fashion the unequalled value of this Journal to Advertisers.

Educational.

R.I.B.A., SOCIETY OF ARCHITECTS
AND CIVIL SERVICE TECHNICAL EXAMINATIONS, preparation by correspondence or residence. 29 first places.—G. A. T. MIDDLETON, 19, Craven Street, Strand.

Competitions Open.

CITY OF BIRMINGHAM.
COUNCIL HOUSE EXTENSION.
TO ARCHITECTS.

The Lord Mayor and Corporation of the City of Birmingham are desirous of EXTENDING the present MUNICIPAL BUILDINGS, and invite ARCHITECTS to submit DESIGNS for the same.

Sketch Plans only are required to be sent in by MARCH 31, 1906, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete Designs in a final competition amongst those so selected.

The Corporation has appointed Sir ASTON WEBB, R.A., and Mr. E. INGRESS BELL to act for them as their Professional Advisers in this competition.

Particulars of conditions, with Plan of Site, &c., can be obtained on the payment of One Guinea (to be returned to bona fide competitors), on application to the Town Clerk, Council House, Birmingham.

Contracts Open.

TO BUILDERS AND CONTRACTORS.

The Board of Guardians of the CLUTTON UNION hereby invite TENDERS for:—

A. Certain ALTERATIONS AND REPAIRS to the WORKHOUSE INFIRMARY, BOYS' LAVATORY, CLOTHING STORE AND OFFICES.

B. THE ERECTION OF NEW VAGRANT WARDS. Forms of Tender, with copies of Bills of Quantities, will be forwarded on application to the Architect, and the Plans and Specifications may be seen on application to the Master at the Workhouse, or at the office of the Architect, Mr. WILLIAM F. BIRD, Midsomer Norton, Somerset, from whom any further information may be obtained.

Sealed Tenders, duly endorsed, must be delivered to me at my office on or before TUESDAY, 9th January next.

The Guardians do not bind themselves to accept the lowest or any Tender.

J. SUMNER BURY,
Clerk to the Guardians.
Temple Cloud, Bristol.
9th December, 1905.

WEST SUFFOLK COUNTY COUNCIL. TO BUILDERS.

SHIRE HALL, BURY ST. EDMUNDS.
West Suffolk County Council are prepared to receive TENDERS for ALTERATIONS AND ADDITIONS to SHIRE HALL, Bury St. Edmunds.

Builders wishing to Tender must send in their names and addresses to the undersigned.

Builders selected to Tender will be supplied with a copy of the Bill of Quantities on depositing £5, which will be returned on receipt of a bona fide Tender.

Plans, Specifications, and a copy of the Form of Contract may be inspected at the Temporary Offices, 5, Crown Street, Bury St. Edmunds, or at the Offices of the County Architect, Sudbury and Bury St. Edmunds, on or after the 1st JANUARY, 1906.

Sealed Tenders to be delivered to me on or before TUESDAY, the 16th day of January, 1906.

The Committee do not bind themselves to accept the lowest or any Tender.

A. AINSWORTH HUNT, M.S.A.,
County Architect,
Sudbury,
Suffolk.

December 4th, 1905.

THE URBAN DISTRICT COUNCIL OF SOUTHGATE.

MAKING-UP OF PRIVATE STREETS.

TENDERS are invited for the Making-up of YORK, NATAL, and OAK ROADS at Bowes Park, within the Council's district.

Plans may be seen on application to the Council's Surveyor, Mr. C. G. LAWSON, from whom copies of the Specification and Forms of Tender may be obtained on depositing £2, which will be returned on receipt of a bona fide Tender.

Tenders, endorsed "Private Streets," must reach the undersigned not later than TWELVE o'clock at Noon, on MONDAY, the 18th day of December instant.

The Council do not pledge themselves to accept the lowest or any tender.

W. M. ELLENOR,
Clerk of the Council.
Council Offices, Palmer's Green, N.,
5th December, 1905.

OUR METHOD OF ADVERTISING A "WANT"

not only brings results, but it saves you expense.

We give three insertions of an advertisement for the price of two, and in addition we tabulate the particulars you send under a special heading in the Employment Register, and keep it there for *six weeks* free of any extra charge.

Thus for 3s. a four line advertisement appears in two places in our paper, and your "want" is advertised for six weeks.

We know this is generous treatment, but we think when a man is out of a situation it is a time when a little generosity is appreciated. The letters we have already received from those who have taken advantage of this scheme point clearly to the truth of this, and we are glad to know that the Employment Register has already helped many to find good positions.

The only condition we make is that immediately an appointment is obtained we are advised in order that we may take the number and name off the Register, thus saving waste of space.

All advertisements for next week must reach this office not later than 5 o'clock on Monday, the 18th inst.

The Employment Register in this number appears on page xx.

Property & Land Sales.

Re Gray & Co., 26, Sanglew Road, Catford, S.E.
MESSRS. HENRY W. FIGG & SON will SELL by AUCTION, on the PREMISES, on MONDAY, DECEMBER 18th, 1905, and following day, at TWELVE o'clock, the nearly new STOCK-IN-TRADE OF BUILDERS' IRONMONGERY, comprising hocks, nails, screws, brass foundry, iron barrel and fittings, R.W. goods, kitcheners, self settlers, tile and other stoves, chimney pieces, sanitary ware, tiles, &c., also a useful spring van, high trap, iron safe, a platform machine to weigh 5 cwt.

* Recommended for acceptance.
[Architect's estimate, £29,500.]

Woolwich.—For various works at the Powis Street special school, Woolwich, for the London County Council. Mr. T. J. Bailey, education architect:—

W. Harris, Steam Joinery Works, North Woolwich £432
Thomas & Edge, Anglesea Avenue, Woolwich 427
E. P. Builed & Co., Strathmore Road, Croydon 399
Vigor & Co., King Street, Poplar 365
Kirk & Randall, Warren Lane Works, Woolwich 363
H. Groves, Stockwell Street, Greenwich 356
H. Line, St. Peckham Rye, 333
Enness Brothers, Erith, Kent 274
* Recommended for acceptance.

Coming Events.

Wednesday, December 13.

NORTHERN ARCHITECTURAL ASSOCIATION.—Mr. T. Preston on "Italian Art and Travel," at 7.30 p.m.
EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. L. G. Mouchel on "Feito-concrete Construction," at 8 p.m.
INSTITUTE OF SANITARY ENGINEERS.—Annual Dinner, Holborn Restaurant, at 6 p.m.

Thursday, December 14.

SOCIETY OF ARCHITECTS.—Mr. J. R. Manning on "Cheap Houses for Rural Districts," at 8 p.m.
T-SQUARE CLUB.—General Meeting, Café Monico, at 5.45 p.m.
MANCHESTER SOCIETY OF ARCHITECTS.—Mr. C. H. Heathcote on "Some Lessons from American Methods," at 6.45 p.m.

Friday, December 15.

INSTITUTION OF MECHANICAL ENGINEERS.—Meeting at 8 p.m. Discussion on Alloys. Mr. E. G. Izod on "The Behaviour of Materials of Construction under Pure Shear."
ARCHITECTURAL ASSOCIATION.—Mr. W. H. Bidlake on "Church Towers and Spires," at 7.30 p.m.
BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Mr. J. A. Gotch on "The Homes of Queen Elizabeth's Courtiers," at 6.45 p.m.
JUNIOR INSTITUTION OF ENGINEERS.—Prof. J. T. Morris, M.I.E.E., on "Electrical Mains for Power Transmission," at 8 p.m.
INSTITUTION OF CIVIL ENGINEERS.—Mr. E. E. Mann on "Tests of Street Illumination in Westminster," at 8 p.m.
LONDON TOPOGRAPHICAL SOCIETY.—Mr. Philip Norman on "The Roman Wall of London," at 4.30 p.m.
GLASGOW TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Discussion on "The Relative Duties of the Various Building Contractors," at 8 p.m.

Saturday, December 16.

JUNIOR INSTITUTION OF ENGINEERS.—Visit to the Electrical Engineering Works of Messrs. Johnson & Phillips, Old Charlton, at 10 a.m.

Monday, December 18.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Messrs. A. Gascoyne and A. J. Dix on "Stained Glass," at 8 p.m.

Tuesday, December 19.

MANCHESTER SOCIETY OF ARCHITECTS.—"Impromptu Debates," at 6.30 p.m.
EDINBURGH ARCHITECTURAL ASSOCIATION.—Associates' Annual Dinner.
ARCHITECTURAL ASSOCIATION CAMERA AND CYCLING CLUB.—Mr. Francis Bond on "Bay Design in the English Mediæval Churches," at 7.30 p.m.

I WANT
TO GIVE YOU A
BETTER POSITION
AND BETTER PAY.

I know I can do this for you by our successful system. We give you the right training to enable you to leave the overcrowded and poorly-paid trades, where the supply always exceeds the demand, where the unemployed question is prominent, and enter the paying and up-to-date profession of Electrical Engineering. We have done this for thousands, and can do the same for you. We train you by post, in your spare time, direct to your home, and at little cost to yourself.

I SEND YOU FREE

our interesting book, "How to Become an Electrical or Mechanical Engineer." It tells you the story of success in life, and gives you convincing proof that I will carry out what I state. We train you in Electrical Engineering, Electric Tramways, Electric Light and Power, Dynamo Tenders, Mechanical Engineering, etc., etc.

Don't miss this opportunity—it is too good to lose—but write to-day for this free book to SECRETARY,

ELECTRICAL ENGINEER INSTITUTE OF

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

December 20, 1905. Vol. 22, No. 567.

6, Great New Street, Fetter Lane, E.C.

Summary.

Working drawings for factory buildings, more especially for steelwork, should be profuse in details and notes. Nothing in the way of constructional details should be left to the tender mercies of the contractor or the elastic conscience of his foreman. All dimensions should be carefully and fully figured on the drawings. (Page 349.)

In a paper on towers and spires which he read before the Architectural Association last Friday Mr. W. H. Bidlake said that as Northamptonshire and Lincolnshire, with Peterborough as centre, were the home of the spire, so Somersetshire, with Glastonbury or Wells as centre, developed the most important school of tower design. With regard to illustrations, it was difficult, unless one was content with minor examples, to find any which had not been given in "Wicke's Towers and Spires," which since its publication in 1855 had remained the standard work on the subject. (Page 355.)

The late Mr. A. W. Mills, architect, of Manchester, has left £8,000 to the Manchester Society of Architects for the establishment of a home of its own. (Page 357.)

A standard specification for steel for bridges and building construction is to be published shortly. (Page 360.)

Two more unsatisfactory competitions are recorded. (Page 358.)

A portfolio of measured drawings by students of the school of architecture at Liverpool University is proposed to be published yearly, price 12s. 6d., under the direction of Professor Reilly. (Page 357.)

The old T-square club has been wound up and a new one is to be formed. The annual subscription will be one guinea. (Page 358.)

A reredos is proposed to be erected in King's College Chapel, Cambridge, from designs by Messrs. Detmar Blow & Fernand Billerey. At St. Michael's, Leeds, a new reredos by Mr. Temple Moore has been erected. (Page 352.)

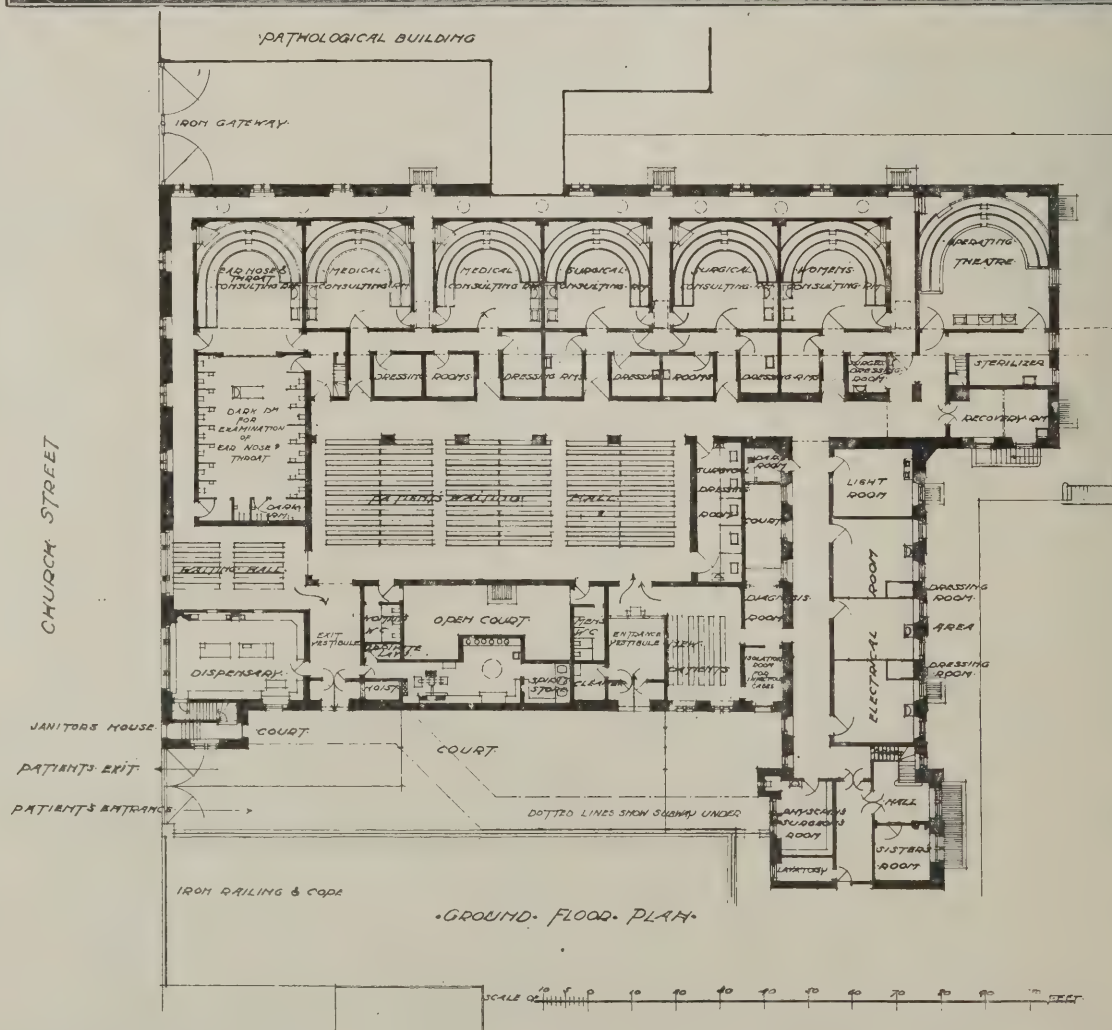

So far as the cost of motive power for lifts is concerned, electricity has a great advantage under present conditions, and this advantage will be still greater when current is supplied (as it will be next year in a great part of London) at a cost of only 1d. per unit. (Page 359.)

For the fourth time the Midland Plastering Co., Ltd., formed six years ago by the principal Nottingham contractors, declares a dividend of 10 per cent. per annum. (Page 360.)

Mr. Jackson's Little Scare.

THE collapse of the Charing Cross Station roof gave occasion to Mr. T. G. Jackson, R.A., to write to the "Times" last week on the subject of iron and steel in modern buildings. His remarks were quite of the nature of a scare. Doubtless some persons will think them timely, but for our part we do not favour the presentation of a very one-sided view with a show of authority, and least of all in the public press in connection with a disaster such as that which happened at Charing Cross, when blame is only too readily assigned to engineers and others who have to take responsibility. Mr. Jackson says: "The constitution of iron, robust enough in most respects, is delicate in others. Damp, which will not injure brick or stone, and will only destroy slowly the harder kinds of timber, will bring iron to speedy ruin. The life of an iron structure exposed to the weather depends absolutely and solely on the thin skin of paint we put upon it, which is constantly perishing and must be constantly renewed. Thirty years, one has heard it said, is the lifetime of a girder. There are, however, many parts of ironwork when once it is put together which a paint-brush will not reach, but to which water will penetrate, rusting the metal, eating into the joints and loosening the rivets. And ironwork is so bound together, and every part depends so much on its attachment to another, the whole structure consisting of a system of ties and braces mutually straining and strained by one another, that a fracture of one member may upset the whole construction. . . . Iron construction, it may safely be maintained, is still on its trial. . . . But the danger is not confined to great railway structures. It must be remembered that the house-fronts of miles and miles of London streets are entirely carried on iron girders, and that these girders are inaccessible, and can never be repainted, and that the name-boards and other facings that conceal them are not designed to be proof against the damps and fogs of London, to the ravages of which the iron girder is as susceptible as the human lung. . . . It is reported that an engineer has prophesied that no one will use iron or steel in his building thirty years hence. I feel sure that no architect who wishes his building to live should do so now. He will do wisely to exclude it from his work, except in such minor matters as ties and bolts and plates to stiffen timbers or small girders to carry floors. So used, iron is a valuable servant, but it makes a very bad

master." Such wholesale condemnation of materials which have been found to be of inestimable service, simply because they have a tendency to decay, is absurd. All materials are subject to the same tendency, and we have only to take proper precautions in order to delay or prevent that decay. Of course iron and steel require attention, but the same might be said of every detail of construction. There is no material which is permanent, and the only question to be considered is whether a material will have an efficient life long enough to justify our using it. For commercial building to-day iron and steel are very necessary. They also allow large light spans to be constructed which would be impossible with other materials. It is useless to rail against the utilitarian structure *per se*, because utility is the first essential of architecture, as of every art. Buildings have not to serve an idealistic purpose alone, but must have practical and commercial uses, and iron and steel are necessary to progress. In monumental buildings it may be reasonably doubted whether primary dependence should be placed upon unprotected iron and steel, although if proper precautions are taken they could be made to outlive timber, and would probably last as long as brick and stone, but architects who have to deal with this class of work must not expect to lay down the law for the greater number of structures. Buildings are not always required to last for ever. It is not as if there were no preservative processes which would prevent the corrosion of iron and steel. There are the Bower-Barff process, the well-known Dr. Angus Smith's solution, many anti-rust paints, and finally the encasing in cement-concrete—the best safeguard of all, and one substantiated by scores of instances. In reinforced concrete it has been conclusively proved that steel is completely protected against corrosion. To talk of iron construction being still on its trial is fatuous, and it is a little too conservative to ask us to refrain from the general adoption of new methods till they have been tested for a hundred years or more. Other architects have followed Mr. Jackson by calling the engineers of Charing Cross to account, but in doing so they have only betrayed their ignorance of the subject. Many theories about the disaster are suggested, most of which are quite unscientific, and we desire in the interest of the architectural profession to point out that these critics represent only a small and insignificant section of opinion.

This dispensary forms part of a scheme for the extension of the infirmary to the west. The building was completed in the early part of this year. It has been planned with the greatest care and is a model of its kind. The arrangement for the entrance and exit of patients is excellent.

NEW DISPENSARY AT THE GLASGOW WESTERN INFIRMARY. JOHN BURNET AND SON, ARCHITECTS.

FACTORY BUILDINGS.*

Their Planning and Construction.

By A. ALBAN H. SCOTT, F.I.S.E., M.S.A.

AS a preface to this subject of planning and constructing factory buildings I may note, in regard to the time occupied in building, that a workshop recently erected at Pittsburg, U.S.A., 1,220ft. long by 66ft. wide, was commenced and finished complete, with floors and electric travelling cranes, in the short period of nine months after commencement; and quite recently a factory requiring 1,500 tons of steelwork was commenced and erected in fifty days. This rather tends to show that our British steel constructing firms require to use more energy than they do at the present time in getting quick delivery and erection of buildings. Quite recently we were able to get a large shop, covering an area of about 30,000 sq. ft., fitted with heavy electric elevator cranes, finished complete in thirteen weeks.

American and British Workshops.

Comparison is often made between American and British workshops. It is unquestionable that the American workshops are the better planned, lighted, ventilated and more up-to-date generally. It might reasonably be assumed that this arises from the fact that most American workshops have been built in recent years, and have benefited by the experience gained in the older shops in England. Taking the modern shops in England, however, I think that they compare very favourably with the American workshops, and are far superior to the majority of Continental factories.

In designing a Factory

there is something more to be considered than the four walls and roof. In the factories of England there is a very extraordinary want of uniformity in design, and difference in the materials of construction. Every inducement should be given to the hands employed to suggest improvements in the works, machinery, &c., and it is usual in good English and American factories to provide a box specially to receive written suggestions from the employees, for which they are suitably rewarded. This, however is rather a question for management, which is not within the scope of this paper. I should like to add that it is most desirable that an annual inspection should be made of the whole of the buildings, and a report submitted to the owners, exactly as an auditor does each year with his accounts. The small fee chargeable for this would be more than repaid by the improved condition of the buildings.

Effect of By-laws.

We hear a great deal about the objections to the unnecessary restrictions contained in the by-laws of the urban and rural district councils. There are undoubtedly many points which require a considerable amount of modification, and thus allow a freer hand to architects and owners with regard to new factory buildings; at the same time, we have always found the district council surveyors very willing to help matters.

The Working Drawings

for this class of building, more especially for steelwork, should be profuse in details and notes. The use and abuse of colouring should receive careful consideration. Unnecessary colouring involves a waste of time and money, and is confusing.

Drawings should be prepared so that they can be sent to the contractor and worked to entirely without further explanation, and nothing in the way of constructional details should be left to the tender mercies of the contractor or the elastic conscience of his foreman. This system will save serious delays

in the output of steelwork from the contractors' works.

Dimensions should be carefully and fully figured on the drawings. No reliance should ever be placed on the scale. The present-day system of first tracing the drawings and then having sun prints taken from the tracings must necessarily result in a great difference between the scale of the original drawing and the scale shown on the sun print, by reason of unequal shrinkage, and this may result in great variations in the sizes of the parts which go to make up the building. Cutting to steelwork on the site is an expensive item, and a mistake of a few inches in the drawing will entail a vast amount of cutting.

Cost.

It is difficult to give any definite figures of the cost of factory buildings, as very little variation in the design of the building governs this to a great extent. However, it might be of interest to you to have the following particulars:—

First Building.—Constructed of steel, with screen walls of brick and with concrete foundations and asphalt flooring; ground floor and wooden upper floors having a floor space of 12,800ft. super.; height of building 11ft. clear for each storey; cost 1 $\frac{1}{2}$ d. per ft. cube.

Second Building.—Shop one storey in height, covering an area of 20,000ft. super., formed of steel and brickwork, taking very heavy electric cranes; height 22ft. to eaves, including all gantry rails and fittings, foundations, &c., paved with P.C.C. paving, 2 $\frac{1}{2}$ d. per ft. cube.

Third Building.—Covering an area of 10,560ft. super., height 18ft. to eaves, including reinforced concrete foundations and concrete floor, 1 $\frac{1}{2}$ in. paving, all complete, 1 $\frac{3}{4}$ d. per ft. cube.

A factory consisting of the ordinary solid brick walls with P.C.C. and 1 $\frac{1}{2}$ in. paving, steel principals, and slate roof, cost 4 $\frac{1}{4}$ d. per ft. cube.

Choice of Site.

In selecting a site for the purpose of factory premises there are many points to be kept in mind. Due consideration should be given to the fact that the site may have to be used for other purposes than those immediately under consideration. For instance, the site may prove to be too small after a fair number of years without any possibility of extension, in which case the whole works may have to be sold and a larger site bought, and it should then be possible to sell at a reasonable profit.

Generally, for all classes of manufacture, the site should be free from any risk of flooding by river, sea or other contingencies of a like nature, and a damp site should be avoided not only for the health of the occupants but also for the bad effect on the electrical plant, machinery and boilers. Care should be taken that river or sea walls are sufficiently strong and high to allow for excessive spring tides. Walls which are quite capable of retaining ordinary tides are far from sufficient to retain the heavier flood tides, and great damage will result through swamping of the site.

It is important to remember in purchasing a site that in almost all classes of factories

Heavy Machine Beds

must be put in, and in many cases part of the actual machinery has to be sunk below the floor-level, and this, when the permanent water-line is only a little below the surface, necessitates the floor of the factory being raised to a considerable height. Thus practically the whole of the site has to be raised so as to keep it clear of the water-line, and in order to have a free run into the various workshops the roads on the site need to be raised correspondingly. The great expense entailed by these works should therefore be fully considered before purchasing a site

only a little above the permanent water-line, or one liable to be periodically flooded.

Due regard must be had, to the possibility of cheap labour in the neighbourhood, and the accommodation close at hand for the employees.

Determining Nature of Foundations.

In considering the cost of any building land care should be taken to ascertain by trial holes or otherwise the probable nature of the foundations that may be required; and if a large amount of money will have to be spent upon them, owing to the expensive nature of the foundations, the cost of the site should be proportionately less.

If the site is of a wet or marshy nature, sometimes a danger arises owing to the water being drained off by local operations, such as the sinking of wells. This will cause subsidence over the general site, and also, in case the subsoil has a good vein of sand, it is probable that one of the adjoining neighbours will excavate for the sand, and might dredge below the water-line. This would again cause subsidence. Unfortunately, there is very little chance of getting compensation for damage done to buildings through this, and no compensation can be obtained when the damage is caused through water being drained from the site, although serious damage and danger may be caused to the adjoining buildings.

The site chosen should have some good means of transport easily available, such as a railway siding or a wharf, and it has been proved that a factory cannot economically be a half-way house between the locality where the raw material is purchased and the place where the finished goods are sold. Unless governed by other considerations the factory should be either as near as possible to the source of the raw materials, or else as near as possible to the customers.

Another point of importance is the provision of proper access to the site. It sometimes happens that the roads leading to the works are in such a bad condition, or are so narrow, with such restricted corners, it would be quite impossible to get a 30ft. boiler into the works.

Lighting.

Care should be taken that the building can be so arranged that light will be obtainable in the required direction. In some workshops and factories it is essential that the light should only be obtained from the north; in others, such as drying rooms, &c., a south light is more desirable.

The question of probable nuisance from the factory chimney should receive consideration. If a noxious trade is to be carried on, a licence will be required from the local authority. In a valley a chimney may have to be built to a great height to carry the smoke over the top of a village, thus causing a large additional expense.

General Lay-out.

In laying out the general plan of buildings, with a little manipulation small portions of the site can readily be made suitable for the purpose of planting low shrubs or trees, or even to form small gardens. This not only adds to the beauty and cheerfulness of the factory, where the employees spend at least one-third of their lives, but with the additional cheerfulness more work is attained in the same number of hours. The expense is not a serious item either for the first cost or for maintenance.

In forming the roads in the works I think the best form is to have the centre of the road the lowest point, so that all rain is taken away from the foundations of the buildings. Under the roads a series of small tunnels should be constructed for the accommodation of all pipes, &c., properly divided so as to reduce fire risks, &c., to the smallest degree; the whole of the covering to the tunnels to be made removable, and framed

* Abstracts from a paper read before the Institute of Sanitary Engineers on December 6th, 1905.

of material similar to the paving adopted for the road; these can be made very light, and to carry any weight, by using concrete slabs reinforced with steel.

The roads should be paved for at least a width of 16ft., and provision should be made for tramway tracks, which are of various gauges, from 15ins. to 30ins. The roadway should not be more than about 6ins. to 9ins. below the factory floors, as the tramways must have an easy run into the factory. It is not generally necessary to construct footways in works' roads, the traffic being comparatively so small as to render this additional expense unnecessary.

If it has been decided to adopt north lighting, this considerably affects the general disposition of the buildings. The main offices should be placed near the entrance, with the main gateways one each side of the office block, one being for the "in" road and the other for the "out" road. A small office for checking should be placed next the gates, and roadways should have weighbridges for carts. The gates should be opened and shut by levers from the check office. The works manager's and staff offices should be placed as nearly as possible in the centre of the works, with windows facing as much as possible towards the works.

Points to be noted in regard to Foundations.

The following points should be noted in regard to the treatment of foundation works in various soils:—Where a sand or gravel foundation overlies clay on a slope, a drain should be laid so as to intercept the water on the upper side of the building, and the ground should be built upon with as little excavation as possible. In the case of soft ground overlying hard, it is economical to sink to the firm ground if it is not more than 2ft. down. To escape the effects of heat and frost the foundations should be at least 3ft. under ground, and in clay soil at least 6ft. Rock forms a good foundation, but must be levelled, which is a costly operation. If on a slope, it should be levelled in steps and the hollows in the rock filled in with concrete. Gravel forms the best foundation. Sand should be laterally confined, to prevent it being washed away. Clay is treacherous and damp, and foundations should be taken deep down. A chalk soil should be kept well drained, otherwise it will be unfit for building on. Made-ground should be avoided where possible, even though it may have lain undisturbed for years. Where it is necessary to build direct on to made-ground a reinforced concrete raft should be employed to spread the weight over the whole site. In the case of soft ground overlying hard at a considerable depth below, piling may have to be resorted to. Piles may be of timber, reinforced concrete or iron screw piles. Another method is to sink brick or iron cylinders to the firm ground and fill in afterwards with concrete.

The machinery to be installed and method of working the different manufacturing processes should all be very carefully laid out before the buildings are designed, as well as the method of internal transit of raw and manufactured materials. The chief point to be kept in view is to so plan the buildings that a maximum output of work is obtained at the most economical rate.

The size and weight of the materials to be manufactured, also the sizes of the various machines required, must be carefully borne in mind, and the height, width and stability of the shops and spacing of the supports must be arranged accordingly. The stanchions and girders should be constructed to support the travelling cranes, jib cranes, shafting and other equipments, thus avoiding the necessity of introducing additional supports and framing to carry these after the main structure has been completed.

Heights and Spans.

No shop should be less than 20ft. in height; 12ft. is better. It is economical to keep the spans under 60ft. and not less than 20ft.

Taking a building 150ft. long by 120ft. wide, it is cheaper by £130 for a two-span building in comparison with a three-span covering the same area. It requires careful consideration whether a process of manufacture can be more economically worked in a building consisting of ground floor only or in one having several storeys. A flat roof is often a great convenience, and can be put to use in many ways; it is, however, likely to become a store place for rubbish. Projections on the interior and exterior walls should be avoided. The stanchion bases should always be kept clear of the floor-space.

Each shop or department should be fitted with a small office for the foreman, this being raised about 2ft. above the general floor, and glass placed all round. This office should be placed so that an uninterrupted view can be obtained over all the shop.

Emergency Exits and Outside Stairs.

Due consideration must be given to the exits necessary in case of fire. Additional doors, therefore, will probably be required, and in the case of buildings of more than one storey access to the roof should be made from at least two points of the building with fireproof staircases, and also external means of escape from the roof to the ground. This can be done by steel staircases, one at each end of the building; and these should not be fixed across windows, as is often done, thus running the risk of having these external staircases rendered useless.

It is advisable to have the large shops divided by partitions; these can be of light construction, and not necessarily absolutely fireproof, but sufficient to keep the fire back for at least half an hour or so.

Lifts.

It is better, if possible, to arrange the lifts outside the main building. Lift shafts are always a danger in case of fire, acting as a flue for the conveyance of smoke and flame, and in all cases they should be entirely enclosed with fire-resisting materials; the gates should be of solid 2in. teak or oak without panels. Internal staircases for the use of the workpeople should be provided, with special reference to the use of same in case of fire. The enclosures of these staircases should be treated similarly to the lifts; there should be no winders. The widths of the landings and staircases are controlled by the number of people that might be called upon to use these. The treads should be 10ins. wide and risers not greater than 7½ins. Doors to open outwards and provided with springs so as to give direct access to the open air.

Every building must have a secondary staircase, and a certain number of the windows should have openings sufficiently large to allow a person to get out. The treads of stairs should have the edges formed of movable slips, so that they can readily be repaired. The handrails should be of 1½in. gas barrel, with flush joints and easy ramps, fixed at least 1½ins. clear of walls.

Insurance and Fire-resisting Construction.

In planning the buildings due consideration should be given to the question of insurance rates for the buildings and contents. In some of the dangerous trades a large amount in premiums can be saved by judiciously spending a small sum of extra money in using fire-resisting materials where the factory adjoins another building; even a small parapet between two buildings sometimes reduces the premium rate by 15 per cent. There are cases where insurance companies will ask you to spend an enormous

amount of extra money, and if you are not careful to arrange premiums before the work is executed they absolutely refuse to allow any rebate on the rates.

Covered ways connecting the various buildings are objectionable, owing to the increased risk of spread of fire; they should, if required, be constructed of incombustible materials, and so arranged that they do not act as a flue.

Steel Construction.

There are many points in favour of steel construction. First, the practicability of constructing the whole of the building with it; secondly, the small amount of space taken up by the points of support; thirdly, lightness of the building, and the small cost of annual maintenance, there being only a small area of painting every three years. I should advocate that external steelwork be painted at least every two years.

The floor plan of factories should be rectangular; no odd corners or recesses should be allowed unless properly seen from the foreman's office. Recesses are not only bad for the shop itself but they destroy the uniformity of the building line in the works' roads. A few extra feet in height will make very little additional cost in a factory built principally with steel, and the introduction of a large area of flooring in the form of galleries round the building can be achieved at a small additional cost. In this case lifts should be introduced for the conveyance of goods. The gallery floor can be cantilevered out with fire-resisting floor.

The objection to steelwork is that it is rapidly destroyed in case of fire, unless the whole of it is surrounded by expanded metal lathing and plaster at least 1½ins. thick, and this has very rarely proved successful in a conflagration of any size. If left exposed, the effect of fire and water on the steel is to twist the beams and columns into extraordinary shapes.

The steel generally used for this class of work is that known as mild steel, with a minimum tensile strength of 27 tons per sq. in. and a maximum of 31 tons. The elongation should be 20 per cent. in a length of 8ins. The steel for rivets should comply with the Admiralty test. Steel and iron work is capable of beautiful treatment. In Belgium and France this is carried to a high point of art. The work is not hidden by false facings, but the rivets and bolts are formed into ornaments and the flanges and webs nicely panelled.

Boiler-house.

In considering the question of a damp-proof course under boilers, consideration should be given to the fact that a great heat is contained in the lower chambers. Personally I object to the slate damp-proof course, but a material should be selected that will not soften too much or melt at the temperature to which it would be subjected.

In planning the boiler-house the principal point to be kept in mind is the amount of coal to be stored and the best arrangement for unloading coal from boats or railway trucks by conveyor or otherwise. Generally speaking, a conveyor does not pay unless at least 6,000 tons are used during the year.

The front of the boiler setting should always be faced with glazed bricks, and if expense is not a large consideration the lower 6ft. of all the walls of the house should also be faced with this material.

(To be concluded.)

Another Fragment of the old London wall, 20ft. in length and 7ft. high, has been disclosed in the course of erecting a factory in Jewry Street, Aldgate. The owner of the factory is aware of the antiquarian interest in the relic, and has arranged for it to be kept in position, so that it will now project about 3ft. into one of the rooms on the lower ground floor of the new factory.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

OUR PLATES.

THE new tramway offices at Liverpool are now in course of erection on the east side of Hatton Garden, in the centre of the city. The frontage to Hatton Garden is about 184ft. The building will be six storeys high, consisting of basement, ground, first, second, third and fourth floors. In the basement are the overhead-line workshops and stores, strong-rooms, clothing store, eating chamber, &c. On the ground floor is the traffic department, with general and private offices, &c., and also a large car-shed. In the first floor are the general manager's offices, and on the second floor offices for the female staff. On the third floor are tailors' workshop, clothing store, dining-room for staff, kitchen, &c., and the caretaker's rooms. The fourth floor, which is an attic storey lighted by dormers and skylights, is to be used for store-rooms. Electric lifts will give access to the various floors, there being one passenger lift close to the main staircase, one goods lift from the basement to the car-shed level, and one goods lift at the back of the building for all floors. The larger rooms and corridors will be heated by low-pressure hot water, and the extraction will be by means of electric fans. Sanitary accommodation is provided on each floor for the use of the staff. The main staircase and corridors on the ground, first, second and third floors will have glazed-tile dados, and the floors of all corridors (except basement) will have terrazzo paving. All the light areas and strong-rooms and basement corridors are to

be lined with glazed bricks. The joiners' work for the ground floor is to be of teak and on the first floor of mahogany; on other floors, yellow pine and American whitewood. The main front to Hatton Garden will be built of Hall Dale stone and red Ruabon bricks, and the roofs will be covered with Welsh blue slates. The elevation to Johnson Street is to be of red pressed bricks up to the level of the first-floor sills, and Aston Hall brick facings with red pressed brick bands for the remainder. The sills and cornice, and other features not mentioned above, will be of local red stone. The work is being carried out by Messrs. W. Thornton & Sons, contractors, of Liverpool, from designs prepared by Mr. Thomas Shelmerdine, the corporation architect and surveyor. The cost of the buildings, exclusive of fittings and furniture, will be £48,650.

American Building Methods.—Mr. Charles H. Heathcote read a paper on American methods of erecting buildings before last week's meeting of the Manchester Society of Architects. This paper appears to have been the same as he read before the Society of Arts, reported in our issues for December 9th and 16th, 1903.

School Board Architects' Fees.—For preparing plans, &c., of all new schools for the Dundee School Board, and of additions or alterations to old schools exceeding in value £500, Mr. James H. Langlands's commission is to be 2½ per cent. and 3½ per cent. respectively. The measurer's commission is to be 1 per cent. on the total cost.

Law Cases.

A Paint Case.—In the Chancery Division of the High Court of Justice last week Mr. Justice Warrington heard an action brought by J. B. Orr & Co., Ltd., of the Silicate Paint Co., against Robert Smith, a painter and decorator, of Bury. The plaintiffs, as owners of the waterproof paint called "Duresco," alleged that the defendant had been passing off an inferior non-waterproof paint called "Freshel" for it, in connection with the re-painting of the technical schools and the textile operatives' hall at Bury. The defendant denied such statement, and said he had permission to substitute "Freshel" for "Duresco." After hearing all the evidence, his Lordship held that the plaintiffs had no cause of action, and he therefore gave judgment for the defendant, with costs.

Architects' Fees.—In the City of London Court recently Mr. G. H. Paine, architect and surveyor, Moorgate Street, sued Mr. E. Lowitz, of Stoke Newington, to recover £21 5s. for the preparation of plans for a proposed villa. Mr. Paine stated that he had received instructions to prepare the plans at an agreed fee of 5 per cent. At a later interview he was instructed to finish the plans without waiting for the completion of the purchase of the site. The cost of the site and land was not to exceed £1,200. A month or two later the defendant said his wife would not sign the contract. Consequently the transaction fell through. The present claim was for 2½ per cent. on the estimated cost of the building. The defence was that before the complete plans were prepared the plaintiff was told that it was not defendant's intention to proceed with the matter. The jury returned a verdict for the plaintiff for £18 18s.

THE ARCHITECTURAL PLANNING OF PUBLIC BUILDINGS.

BEFORE last Thursday's meeting of the Leeds and Yorkshire Architectural Society Mr. H. W. Wills read a paper on this subject. Greek architecture, he said, though perfect in its limited field, had provided few lessons in planning, while, on the other hand, in some Egyptian temples they found conceptions not surpassed in their mystery and grandeur by any mediæval cathedral. But it was Roman work—its basilicas, baths, theatres, amphitheatres and palaces—which showed most clearly how far a magnificent and poetical conception might obliterate their sense of dissatisfaction at indifferent and coarse architectural detail. None of the mediæval churches were so fruitful in suggestions for modern use as were the Basilican and Byzantine types of planning. Wren's ability as a planner could be best judged by his smaller churches, and it was difficult to imagine why Wren's interiors had not been taken as models for dissenting chapels, in place of the hideous nightmares often afforded by such chapels, especially in Wales. Italian palaces afforded valuable lessons in planning, and the courtyard principle might well be adopted in many modern buildings. Some of the most valuable lessons in stately planning were found in the works of English architects, from the time of Wren and Inigo Jones to that of Sir William Chambers. Curiously enough, it was in designs of a domestic nature that they frequently found most fertile suggestions for public buildings. Greenwich Hospital he instanced as one of the finest groups of buildings in this country. There had been a great advance in the planning of libraries, especially in some of the recent American designs. In dealing with small schemes for public buildings they should refrain from using all the site, and adopt instead a concentrated group of buildings.

FRONT ELEVATION

FIRST-FLOOR

SEMI-DETACHED HOUSES AT WIMBLEDON. CHAMBERS AND MARTIN, ARCHITECTS. These houses are about to be erected at an estimated cost of £1,650.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

New Bridge on Site of Old Pile Bridge.

CREWE. — HAMMERLESS writes: "The accompanying drawing shows a bridge I propose to erect on the site of an old pile bridge. The lines of piles shown are the piles of the old bridge. I propose to draw those which come within the area of the foundations in order to prevent uneven settlement. After these piles are drawn, would it be advisable and possible to fill the holes with sand? I do not know to what depth they are driven. Do you consider what I show is the best form of foundation in the circumstances? I am afraid that the abutment walls might be liable to uneven settlement: do you think there is any fear of

back, the latter being finished above the top of the existing chimney-pots; and since the new houses have been erected, and not before, A's tenant complains that with the wind in a certain direction he is smoked out. Should not A raise his chimney-stack to a suitable height? Is B liable in any way?"

If A's house has been built twenty years I am of opinion that he can prevent B from rendering his house smoky (2 & 3 Will. 4, c. 71), but if the house is not so old I have some doubt about the matter. In any case I doubt whether it is not better to suffer the inconvenience than to fight an action at law.

F. S. I.

Additions to Workshop.

E. H. writes: "My client wished to make an addition of one storey to his workshop, which is at present only one storey high. Plans were submitted to the local authority and passed. After this, however, my client resolved to add an attic also, which increased the height of the addition by 5ft. 6ins. Plans were not submitted for this little extra addition, which was thought unnecessary, and in consequence building was stopped by the council's surveyor. I therefore submitted a revised plan showing the whole addition, which is entirely in accordance with the local by-laws, but in spite of this the plans were disapproved, and the only reason given

such as will command the issue of a "mandamus" to compel the council to pass the plans.

F. S. I.

Formula for Strength of Struts.

HIGH WYCOMBE.—F. B. H. writes: "Is this a correct formula for wrought-iron bar struts with distance pieces —

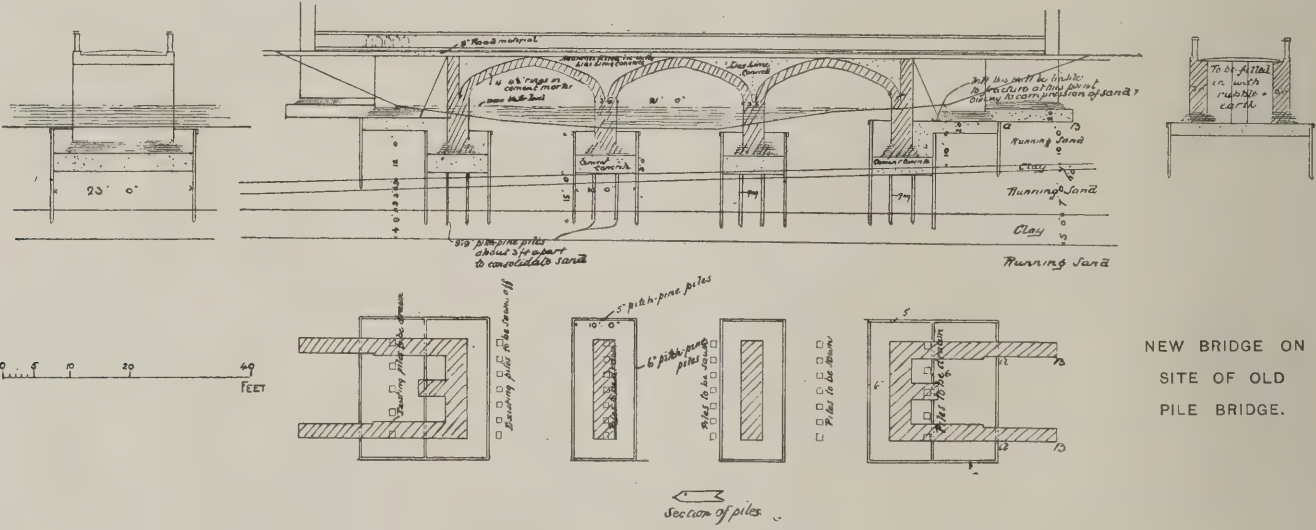

$$s \text{ (load per sq. in.)} = \frac{4}{1 + \frac{l^2}{750d^2}}$$

(for one end fixed), as it does not agree with the following table, which I take to be correct?—

Length, least width.	Safe loads in tons per sq. in.
60	$\frac{1}{2}$
50	1
40	$1\frac{1}{2}$
30	2
20	3
10	4

I suppose that the least width is the width of a bar, and *d* in the formula is the same."

The constants in Gordon's formula vary according to different authorities. Gordon himself only revived the formula (which was originally due to Tredgold) and gave no constants. An average constant for angle, tee, cross, channel, rolled joist, bars and distance pieces, hollow-square, and built sections generally, is $\frac{1}{900}$ for both ends fixed,

this? I propose to joint the piles as shown, so as to make the piling water-tight and then to pump out the water and excavate to the required depth. The bridge is across a river in a private park, and will not be subject to heavy loads. Would it be necessary to put in pile foundations under that part of abutment walls marked A B on the plan?"

If the present piles are chiefly through running sand, the sand will fill into the holes again as the piles are drawn, and therefore will require no other attention. The proposed arrangement for the new work looks very suitable to the case, except with regard to the end portion of the wing walls at each abutment where they project beyond the sheet piling. The concrete under these ends may be widened somewhat to reduce the intensity of pressure. There does not appear to be any particular liability to fracture at the foot of the bank, but the whole case is one of inevitable risk, owing to the alternate beds of running sand and clay.

HENRY ADAMS.

Smoke from Chimneys and Adjoining Premises.

TONBRIDGE writes: "A owns a house at the end of a terrace, adjoining which was a vacant piece of land upon which B has erected two houses to the same line of frontage, but these houses are carried up higher than A's. The chimney flues of the existing house and the new house are back to

is that the building is undesirable. I may say that the man who occupies the property adjoining that of my client (and who carries on business as a grocer and fancy dealer) wrote a letter to the authorities objecting to any addition to this workshop, and complained of an obstruction to his light, which is not ancient, and which in fact would be difficult to prove, and this letter, together with a little personal feeling over the matter, has without doubt influenced the decision of the authorities. What course should I adopt?"

The addition of the attic storey clearly justified the urban district council's surveyor's action in stopping the work, even though everything was being built in strict accordance with the by-laws. You submitted plans for a two-storey building and then proceeded to erect a three-storeyed one! That your council should now refuse to pass plans merely because they consider the building to be "undesirable" is, apart from the first issue, quite unjustifiable. They must either pass plans or refuse them on their merits, and not deal with them in accordance with some idea or "fad" of their own. If your client still wishes to complete his building to the full height of three storeys, I advise you to put the matter in the hands of a local solicitor at once, taking care to give him all the correspondence that has taken place from the beginning. He will then be able to advise as to whether or not your case is

$\frac{2\frac{1}{2}}{900}$ for one end fixed and the other pivoted, $\frac{4}{900}$ for both ends pivoted. The objection to this formula is that the strength does not vary so much in accordance with the diameter as with the radius of gyration, which was the modification introduced by Rankine. The table of safe loads given by querist is only approximate; it appears to be for wrought-iron struts fixed at both ends.

HENRY ADAMS.

The new Reredos in St. Michael's, Headingley, Leeds, was dedicated last Thursday. One of Pearson's most successful parish churches, St. Michael's has hitherto been conspicuously lacking in a focus, which the reredos, designed by Mr. Temple Moore, supplies. It consists of a series of niches filled with figures richly decorated, and surmounted by a cresting.

A Reredos in King's College Chapel, Cambridge, is proposed to be erected from designs by Mr. Detmar Blow and Mr. Fernand Billerey. The general idea of the scheme is to continue the Renaissance woodwork panels round the east end of the chapel, heightening their effect by more elaborate carving and by gilding. At the back of the altar between pairs of Corinthian columns are to be three statues.

R.I.B.A.

Messrs. Alexander Gascoyne and
A. J. Dix on Stained Glass.

A MEETING of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the president (Mr. John Belcher, A.R.A.) in the chair, when papers on "Stained Glass" were read by Messrs. Alexander Gascoyne and A. J. Dix.

The death of Mr. H. H. Collins, elected an Associate in 1859 and a Fellow in 1877, was announced.

Mr. Alexander Gascoyne, referring to examples that remain of old stained-glass work, said that, without attempting to copy deliberately, many lessons may be learnt from it. If once we can catch the spirit and feeling that inspired the early glaziers, and work it into modern requirements, we shall be progressing towards perfection. Whether or not glass can be manufactured equal to the old glass is a matter of opinion; but by waiting and picking out the choicest sheets at the makers', and carefully selecting these, results can be obtained which will compare favourably with the early windows. It is the inequalities, variations of thickness and colours, and accidental markings which give the depth and brilliancy to the glass, and upon their judicious employment depends the success of the work. In good work the cost of the glass rarely, if ever, enters into the consideration of the glazier; he chooses the various glass as the artist does his colours.

Beautiful Results

can be obtained by giving a free rendering of the early principles, and by designing foliage or ornament to take the place of canopies and bases, without losing the feeling or character of the old glass. It is immaterial what particular style is adopted provided we allow our originality to develop that style and produce stained glass which for charm of design and colour will adapt itself to the character of the building. The assistance architects can give in suggestions for the general schemes of windows cannot be over-estimated; their co-operation has produced in many instances most successful results. When the profession as a whole demand really good work, and encourage designers who are known to have the interests of their craft at heart, there will be no lack of beautiful work. But so long as the greatest demand is for the cheapest article it cannot be expected that the domestic or ecclesiastical stained glass of this country can improve. A stained-glass window

Need not necessarily be Expensive.

It can be made simple in design, and therefore not costly; but it does not follow that it is not in the best possible taste, and that the best material has not been used. The author impressed upon those designing stained glass for churches that the windows have a double mission—they should form a beautiful decoration and be devotional in feeling. The figures introduced should be an aid, not a hindrance, to devotion. Arouse the critical faculty, and no devotion is possible. To design some windows much careful consideration is necessary; really good work can hardly be done unless the artist is personally in sympathy with the object of the design. Stained glass for modern dwellings should be designed to form part of the decorative scheme; the building itself should be seen before preparing designs. Rich colour schemes should be used with the greatest care. Simple treatment in white glass has been used by some architects with most satisfactory results, harmonizing admirably with any style of decoration. The importance of massing the design in domestic ornamented glass cannot be over-estimated.

Referring to the full-size detail drawing prepared to give the architect an idea as to the general effect of the leads, the author pointed out that this was not a working drawing; a line drawing of the various shapes of the glass had to be prepared to guide the cutter in cutting the glass and the glazier in piecing it together; unless every care was taken with this drawing all the architect's trouble might be lost.

Mr. Dix's Paper.

Mr. A. J. Dix, after explaining the difference between stained and painted glass and defining the term "stained glass," said a design for a stained-glass window may be in any medium and upon whatever material that most commends itself to the artist. Nor is it even necessary that a design should be made at all. In the author's opinion the highly-finished competitive design for a stained-glass window is

A Mistake, a Delusion, a Snare.

An attractive design is by no means a guarantee of a good window. The capabilities of a maker of stained glass should be judged by his finished work and not by design. One very important point to observe is the architectural fitness of the design—*i.e.*, its suitability as regards proportion, not only as a whole but in detail. It should always be treated in such a way that will keep the window subservient to the architecture, about which there need be no fear if a strict adherence be observed to the natural limitation of the material. The position and size of window should be thoroughly considered, as much detail is often thrown away and a broadness of effect missed by over-elaborating a window which is only seen from a distance; also the amount of light one may safely exclude without over-darkening the interior of the building should be considered. The author went on to speak of the selection of the glass—perhaps the most interesting and absorbing stage in the work. The practice of superimposing pieces of glass held together in one lead in two or even three layers, called

Plating,

though occasionally a useful expedient, the author considered should not be resorted to until every resource had been exhausted to obtain the required colour or tone. As regards the best tint of white glass, one could not go wrong in choosing a tint so often found in early glass—*i.e.*, a cool greenish hue. Describing the method of preparing and arranging the glass before painting, the author emphasized the importance of viewing the glass so prepared in a position against the light, as it will be in the window when finished. Now is the time to make any alteration desired. If the corrections are not made now before the work is painted, any offending pieces will be more reluctantly discarded at a later period. The whole making of a stained-glass window should be one of elimination, adding to, and correction, not only in the initial stage of the glass in its state raw but as the work proceeds, altering the work to obtain the effect aimed at as it progresses. In the process of painting and in fact at no period should anything be taken for granted; the work should be viewed in a perpendicular position and from as great a distance in the studio as possible, and no advance made until at each and every stage nothing suggests itself that could possibly be improved upon. The author went on to describe the process of painting the glass, the pigments employed, the firing, leading, &c.

A vote of thanks to the authors of the papers was proposed by Mr. J. D. Crace and seconded by Mr. G. H. Fellowes Pryne. Messrs. G. Hubbard, C. Harrison Townsend, E. W. Hudson and Mr. John Belcher also spoke in the discussion.

NEW LONDON BUILDINGS.

AT last week's meeting of the London County Council the Building Act Committee reported the following application under the London Building Act, 1894, their consent or refusal being appended in *italics* :—

Extension of the period within which the erection of a bay-window at No. 3, Wedderburn Road, Hampstead, was required to be commenced, on the application of V. H. King, on behalf of F. E. F. Barham. (*Consent.*)

Buildings on the northern side of Codrington Hill, Brockley, on the application of J. W. Webb. (*Consent.*)

Addition at the rear of St. Paul's Presbyterian Church, West Ferry Road, Millwall, on the application of T. P. Figgis, on behalf of the committee of the church. (*Consent.*)

Enclosures to the sides of a porch at the Royal Horticultural Hall, Vincent Square, Westminster, on the application of E. J. Stubbs, on behalf of the Royal Horticultural Society. (*Consent.*)

Projecting carved wooden hood over the entrance to an addition to the hall of the Company of Tallow Chandlers, Cloak Lane, City, on the application of J. D. Mathews & Son, on behalf of the Company of Tallow Chandlers. (*Consent.*)

Retention of a shop front erected under the projecting landing at No. 150, Finchley Road, Hampstead, on the application of Saunders & Son, Ltd. (*Consent.*)

Retention of an iron and glass roof in front of Nos. 24 and 26, High Street, Peckham, on the application of G. F. Morgan & Co. (*Consent.*)

Two glass and iron shelters at the Aldwych Theatre, to abut upon Aldwych and Drury Lane, Strand, on the application of W. G. R. Sprague, on behalf of the Hicks Theatre Syndicate, Ltd. (*Consent.*)

Retention of an open glass roof in front of a greenhouse adjoining No. 79, Queen's Road, Peckham, abutting also upon Carlton Grove, on the application of A. Madgett. (*Refusal.*)

Studio at the rear of No. 70, Addison Road, Kensington, to abut upon Addison Crescent, on the application of A. Poynter, on behalf of Sir E. J. Poynter, Bart., P.R.A., (*Refusal.*)

Retention of two projecting signs at No. 17, Newman Street, Oxford Street, St. Marylebone, on the application of T. Stevens, on behalf of "Argyll's London, Limited." (*Refusal.*)

Five houses on a site abutting upon the north-western side of Church Lane and eastern side of Moring Road, Tooting, on the application of Nash and Lillywhite. (*Consent.*)

Buildings on the site of Nos. 1 to 6, Lombard Street and the Gresham Club, St. Swithin's Lane, City, with external walls at less than the prescribed distance from the centres of the roadways of St. Swithin's Lane and George Street, on the application of Dunn & Watson, on behalf of the Scottish Provident Institution Buildings, Ltd. (*Consent.*)

One-storey bay-window addition at the rear of No. 28, St. Petersburg Place, Paddington, with external walls and boundary fence at less than the prescribed distance from the centre of the roadway of St. Petersburg Mews, on the further application of T. H. Smith, on behalf of F. Lenders. (*Consent.*)

Retention of one-storey buildings on the north side of River Bank, Anchor and Hope Lane, Charlton, with external walls at less than the prescribed distance from the centre of the roadway of River Bank, on the application of J. Rowland, on behalf of Flower & Everett. (*Consent.*)

Retention for a further period of a boundary fence on the northern side of a footway leading from Bridge Avenue to Mail Road, Hammersmith, at less than the prescribed distance from the centre of the roadway of such street, on the application of E. J. Harbott on behalf of Coburn & Co. (*Refusal.*)

Buildings on the site of Nos. 321 and 323, Oxford Street, to abut also upon Dering Street, on the application of Gordon & Gunton, on behalf of Hitchings, Ltd. (*Refusal.*)

Buildings on a site on the northern side of Snowfields and the eastern side of Weston Street, Bermondsey, on the application of Rings & Myers, on behalf of E. B. Kapp. (*Consent.*)

New street for carriage traffic to lead from Merrow Street to Shaftesbury Street, Walworth, on the application of Chitons on behalf of the Ecclesiastical Commissioners. (*Consent.*)

Streets for carriage traffic out of the north side of Uxbridge Road, Hammersmith, eastward of St. Luke's Church, on the application of F. W. Tanning, on behalf of the Trustees of the McQueen Trust Estate. (*Refusal.*)

Modification of the provisions of Part V. of the London Building Act, 1894, so far as relates to the erection of Nos. 189 to 214 inclusive and Nos. 215 to 240 inclusive, Oakwood Court, Kensington, on the application of Rolfe & Mathews, on behalf of Jones Brothers. (*Consent.*)

Modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of residential flats to abut upon Seymour Street, Edgware Road, and Connaught Mews, Paddington, with irregular open spaces at the rear, on the application of D. Brown, on behalf of Lady E. R. Hope. (*Consent.*)

Means of escape in case of fire proposed to be provided on the seventh (top), sixth and fifth storeys and the fourth floor mezzanine of a building to be known as "Thorney Court," Kensington, on the application of Millard & Pryce. (*Consent.*)

WORM HOLES IN WOODWORK.

A Summary of Information as to Causes and Cures.

[A correspondent having put to us the question set out below, we submitted the enquiry to Mr. Harry Hems, of Exeter, whose long experience has enabled him to give an authoritative reply. This we here print in the form of an article, which is intended to meet all future enquiries, so that correspondents will not need to submit further queries on the subject.]

LEE.—F. G. R. writes: "What is the cause of (I imagine) a dry-rot in hardwoods, such as picture frames and furniture? The defect consists of a number of small holes, as if the wood had been eaten away. I shall be glad if you can also inform me of any preventative which can be applied to furniture, &c., to protect the wood from these defects. I have seen several cases in houses in Ireland where the furniture has been destroyed in this manner."

Various Remedies.

This is a condition of things that constantly brings queries, and all sorts of remedies have from time to time been suggested through the medium of various technical journals. It has been recommended to saturate the wood with turpentine, or with benzine and with equally good results perhaps. Further, a strong solution of corrosive sublimate, or an infusion of a bitter kind, such as quassia, has also been tried with a fair amount of success. Copperas and glue, or linseed oil, mixed with turpentine in equal proportions, may be rubbed in daily for a week or two. Such applications have been known to kill the worms. Another receipt is to apply a solution of vitriol, mixed with melted beeswax and a little plaster-of-Paris. A thin paste of this (whilst warm) should be applied to fill in the holes. That done, soak the rest of the wood with methylated spirits of wine and camphor or (if preferred) well saturate it with turpentine alone. Further, fumigate the worm-eaten stuff in an air-tight closet with benzoline. Good results have also been procured by boiling colo-quintida in a little water and dissolving some vitriol in it. This is an application in which some have much faith. Again, tallow may be rubbed into the holes and the furniture afterwards warmed (oil is said to be death to the worms); rub the tallow in several times, or use mercurial ointment in the same way. Take 5 parts of turpentine and 1 of phenol; with a brush well saturate the holes with this mixture so that the liquid has plenty of opportunity for flowing well down into the burrows. Afterwards the holes may be filled up with beeswax dissolved in turpentine, made into a thick paste. The phenol, if it is fortunate enough to reach them, will, of a surety, destroy all the larvae.

Of all these several popular receipts, the application of paraffin oil, or mercurial ointment, are the simplest preparations to use, and perhaps as effectual as any.

Dry-rot a Cause.

The correspondent's suggestion that dry-rot may possibly be the cause of the mischief complained of opens out a different view of things. The primary cause of dry-rot is want of sufficient ventilation, but this can scarcely apply to furniture.

For dry-rot a common remedy recommended is a wash of mercuric chloride (1 to 8 gallons of water), care being taken to thoroughly soak the wood with it on every side. But this must not be applied until after the material has first been thoroughly well cleaned. The application must be repeated frequently for twelve or eighteen months, when some who have tried it assert the disease will be thoroughly stamped out. A very full and useful paper upon this subject has recently been issued by the Board of Agriculture and Fisheries (No. 113) entitled "Dry-rot (*Merulius lacrymans* Fries)," and as this has probably failed to come under the eye of the correspondent in

question, it may be interesting to him as well as to others. This is what it says: "As a destroyer of timber used in the construction of dwelling-houses, the fungus popularly known as 'dry-rot' has been well known for many years. Notwithstanding modern improvements in ventilation, &c., the disease appears to be gradually gaining ground. This is chiefly owing to the following causes:—(1) The use of immature and imperfectly seasoned wood; (2) the rapidity with which modern houses are built, resulting in the imprisonment of a superabundance of moisture in the material used.

The Beginning of Dry-rot.

"Infection with the dry-rot fungus sometimes takes place in the forest, when felled timber remains stored there for some time. The first evidence of such infection is indicated by the presence of red stripes in the sawn wood. If such wood is thoroughly seasoned the mycelium present in the red stripes is killed. If the seasoning is neglected or imperfectly done, the mycelium, which possesses the power of remaining in a latent condition for some time, commences active growth when the wood is used in any part of a building where it is exposed to dampness, and this in some cases is unavoidable, as when the ends of joists are built into a wall. Under such circumstances, dry-rot eventually appears. On the other hand, the fungus is by no means rare on old beams and boards stored in wood yards, &c., and it is mainly from such sources that spores or portions of the spreading mycelium are introduced into buildings by new wood which has become infected. Again, when a house that has suffered from dry-rot is being repaired, sufficient care is not exercised in the immediate destruction, by burning of all diseased wood, and portions that are not too much decayed are often stored for repairing purposes. In consequence the air in towns always contains spores of the dry-rot fungus.

Precautions.

"During the building of a house, the danger arising from the presence of dry-rot may be reduced to a minimum by taking proper precautions. A thorough system of ventilation and the avoidance of damp, stuffy places is of primary importance. The endeavour to exclude dry-rot by hermetically closing all communications with the outer air in the spaces between flooring-boards and joists and similar places, has been practically demonstrated to be an utter failure. In the case of a recently-constructed mansion the expenditure of many thousands of pounds was entailed in rectifying the consequences of such a proceeding. Perhaps the greatest source of danger arises where the ends of joists are built into a wall near the basement of a house, and this is more especially true where there is evidence of red stripe in the wood. As a precaution, the ends of joists should always be treated with creosote.

"Coal tar is not recommended, as its power of penetrating into the wood is very limited, and by forming a waterproof coating it prevents the wood from drying. A frequent cause of trouble is the use of damp, deadening material, or pugging and covering it over with boards before all the moisture has evaporated. Such material should be used as dry as possible, coarse sand being the best for the purpose. The surface of boards coming in contact with deadening material should first be painted over with methylated spirit containing corrosive sublimate in solution 6 ozs. to 1 gallon. The spirit evaporates, leaving a coating of corrosive sublimate on the boards, which completely destroys any mycelium coming into contact with it. It has been proved that the spores of dry-rot can only germinate in moisture containing some alkali in solution, hence coal-dust, cinders or any kind of

humus should never be used for deadening or packing.

"The fruit of the dry-rot fungus presents the appearance of irregularly-shaped, flattened or undulating patches of variable size, adhering by their entire under-surface to the substance on which they are growing. When mature the central portion of the patch is covered with an irregular network (a) formed by slightly-raised anastomosing ribs, and is of a rich brown colour, due to the enormous quantity of spores, which are deposited on surrounding objects under the form of snuff-coloured powder. These spores are diffused by currents of air, or by rats, mice, insects, &c. The margin of the fruiting patch is surrounded by a snow-white fringe of mycelium (b) which spreads in every direction over surrounding objects, creeping up walls, and passing through crevices, the advancing mycelium (c) being supplied with food and moisture from the parent plant, growing on wood. This food is conducted through cord-like strands, which form behind the thin advancing margin of mycelium. Owing to this supply of food from a central source, the mycelium can extend over stones and other substances not containing food, and thus spread from the basement to the top of the house. Each time the migrating mycelium comes in contact with wood the latter is attacked, and a new centre of food supply is established, from which strands spread in search of other sources of food.

"The mycelium often forms felt-like sheets of large size, that can readily be removed intact. These sheets are white at first, but soon change to a pale-grey colour, a character by which dry-rot can be readily distinguished from another wood-destroying fungus, polyporus fermentations, even in the absence of fruit, the felted mycelium of the latter remaining permanently white.

How to Check Dry-rot.

"The spreading mycelium can be checked by the application of carbolic acid, and when its presence is once detected all wood-work that can be reached should be thoroughly saturated with the same substance. The specific name of *lacrymans*, or 'weeping,' alludes to the power of the fungus to attract moisture from the atmosphere. Under certain conditions, moisture is absorbed to such an extent that it hangs in drops, or even drips from the surface of the fungus. This moisture assists very materially in rotting the timber, which, afterwards becomes quite dry and friable. Hence the name 'dry-rot,' which alludes to the last and most frequently observed stage of decay." The above information will probably be useful to many readers.

HARRY HEMS.

Obituary.

Mr. W. Moss Settle, A.R.I.B.A., architect, of Barrow and Ulverston, died on Wednesday last. He was only 29. Having commenced practice for himself at Barrow, he was engaged as architect to the Walney Estates Co. In Barrow he was architect for a number of new buildings and shops.

Mr. H. H. Collins, F.R.I.B.A., F.S.I., of London, died on Wednesday last in his seventy-third year. He was the architect of numerous city offices and warehouses and also of many mansions—including Callis Court at Broadstairs. He was also the architect, selected in competition, for the new Lying-in Hospital for Women in City Road. Since 1877 Mr. Collins had acted as district surveyor for the eastern division of the City of London. He was an expert in arbitrations and light and air cases, and as such his services were in much request.

THE ARCHITECTURAL ASSOCIATION.

Mr. Bidlake on Towers and Spires.

A MEETING of the Architectural Association was held on Friday evening at 18, Tufton Street, Westminster, Mr. E. Guy Dawber, F.R.I.B.A., president, in the chair.

The following new members were elected: Messrs. E. E. C. Clayton, R. N. Hewitt, G. T. Jell, F. J. Daniel, S. Davies, W. G. Wales, and Sir F. C. Rupert Ford, Bart. Mr. R. Herbert was reinstated.

A paper on "Towers and Spires" was then read by Mr. W. H. Bidlake, of Birmingham.

In dealing with the subject Mr. Bidlake said he should not attempt to adduce any new facts or invent any new theories; indeed, it was difficult, unless one was content with minor examples, to find any illustrations which had not already been given in that excellent series of drawings in "Wicke's Towers and Spires," which, since its publication in 1855, had been regarded as the standard work on the subject.

Proceeding, Mr. Bidlake referred to the position of the tower—in a typically English church at the centre of the west end, or, as in the typical cathedral front, two towers flanking the central doorway; occasionally a still more magnificent façade being presented, either by extending the screen beyond the towers to flanking north and south turrets, as at Lincoln, or by placing the towers themselves outside the aisles, and decorating the extended front with splendid sculpture, as at Wells; or, grander still, the arcaded caverns of Peterborough.

At Exeter twin Norman towers form the transepts, while Ely is the only example of a cathedral with a western tower on the central axis, a position so common in the parish church.

Some of our cathedrals have no western towers now remaining, as Winchester: and poor indeed do their fronts appear in comparison with others mentioned.

The Central Tower.

The dome of the Byzantine and the lantern of Spain and the South of France becomes, in Normandy, the central tower, and no Norman or Anglo-Norman cathedral was complete without it. In France the loftiness of the high vault compelled her architects to substitute for the central tower the elegant, but far less imposing, timber *flèche*; and if, after contemplating the wonderful loftiness and airiness of her cathedrals, we return dissatisfied with the low proportions of our own, let us find consolation in the fact that this very lack of internal height has secured for us the retention of the central tower.

The typical Norman cathedral then had both central and western towers, as at Southwell, and it is only when all three are present that the English cathedral realizes its full majesty, and becomes, in fact, one of the grandest works of man.

Timber and Lead Spires.

It is possible that each tower was intended—after the Norman period—to carry its spire. Not a few had timber and lead spires at one time, which have since been taken down. Lincoln once had small timber spires on the western towers, as shown on old prints, and a spire no less than 523 ft. high on the central tower. It is possible, too, that Peterborough was intended to carry spires on all its five towers, but Lichfield alone of all the cathedrals retains her triple spires, and these endow her with such grace that she becomes one of the most beautiful and distinctive in the country.

Saxon Towers.

Of the Saxon towers still remaining many of them are in the centre of the west end, as at Earls Barton, and it seems not improbable that the western position of the tower

in subsequent styles was due to a discontinuation of this essentially English arrangement, a supposition rendered the more probable by the rarity of central-western towers in Normandy.

Towers on One Side.

Although the central-western position of the tower is the typical one for the parish church, it is occasionally found on one side, as at St. Mary Redcliffe, Bristol, or St. Martin's, Stamford. At Wisbeach the tower is almost detached from the church, and in the surrounding district may be found several instances in which it is wholly so. The magnificent tower of West Walton, some few miles away, forms, in fact, the lych-gate of the churchyard. Detached towers are also a local peculiarity of Herefordshire.

Octagonal Towers.

While in an overwhelming majority the tower plan is square, the octagon is occasionally found, as at Stanwick; and in Norfolk and Ireland the round tower is frequent; in the former due to the use of flint and the difficulty of building quoins in that material.

Both Saxon and Norman towers must have been roofed with wood, and a simple squat pyramid, like those which the late Mr. Christian reconstructed on the Norman west towers of Southwell, must have been very frequent, because their construction would be the simplest and most direct. But timber spires must also have existed, for they are represented in old manuscripts. Their form in all probability resembled the ancient timber spires still existing at East Meopham and Newhaven, which, though not of actual Norman date, probably reproduce the design of the Norman originals. This form of spire is octagonal in its upper portion, the diagonal sides bending out below towards the angles of the tower, which they meet in a point. Its shape is due to the timber angle-pieces of the spire being framed into a collar, which is supported by the hip-rafters of the lower spreading sides. This type of spire is common in Germany, as at Erfurt, and still more so in Scandinavia. A fine modern example is that of All Saints' Church, Margaret Street, by the late Mr. Butterfield.

Both this form of spire and the squat pyramidal roof were subsequently translated into stone, and the former may be found as late as the Perpendicular period, as at Bythorn.

We may also suppose that an octagonal timber spire arose sometimes from a flat tower roof, and gave rise to that form of spire so common in France, of which Christ Church, Oxford, is an example. This form, however, like the simple pyramid, was destined to die out; while

the Broach Spire.

which, if it did not originate in Northamptonshire, was certainly developed in that district, took its place in the Lancet period. The broach spire is, in the main, a copy in stone of a timber roof, and its cardinal sides come down over the sides of the tower and end in dripping eaves, but the broaches which fill the triangular spaces between the diagonal sides of the spire and the angles of the tower are of true stone construction, and whether their sloped sides meet those of the spire high up or low down, will determine very much the general outline and character of the spire.

At first these broach spires are of an obtuse angle, and have bold spire lights. One of the noblest spires of this type is to be found at Frampton, a small village near Boston, hidden in trees.

Towers of the Lancet Period.

In the towers of the Lancet period buttresses are sometimes employed in pairs at the angles—the diagonal buttress comes later—but they stop at the belfry stage against the flat pilasters which have been retained from the earlier style. The staircase turret

likewise stops short either of the belfry stage or the spire eaves, and a corbel table is carried between the angle pilasters so as to offer an unbroken square as seating for the spire.

Features in Development.

As the style advanced the broach spire became more acute and loftier, and the broaches and spire lights less in proportion. The broaches, moreover, began to take to themselves pinnacles either at the extreme angle of the tower or at their apex against the spire, or midway up the slope. Next, the bottom spire light was no longer placed on the cornice, but higher up the spire, and the upper spire lights more frequently alternated on the diagonal and cardinal sides. Their gables were frequently crocketed, and niches with crocketed gable heads were placed at the apex of the broaches lying back on the spire, as at Ketton.

The spire itself becomes ribbed or ribbed and crocketed along its angles, and has an occasional horizontal band or moulding, and more pronounced mouldings and a more definite cornice mark its junction with the tower.

At length a momentous change takes place—cornice and dripping eaves are alike abandoned, and a passage is made round the base of the spire, probably a practical innovation to facilitate the repair of the spire; for spires were more frequently struck by lightning in those pre-lightning-conductor days than at present. For safety's sake the passage required a parapet. Although the parapet might slightly overhang the faces of the tower, being carried forward on the cornice, especially when pinnacles supported it at the angles of the tower; yet it was necessary to set the spire and its broaches in a little in order to allow room for the passage. And thus commenced

the Shrinking of the Spire.

Woodford is a simple example of a parapet carried round a broach spire, and, near by, Denford, across the meadows of the Nene, has a parapet carried round a spire of the timber type.

Some very fine Steeples

belong to this transitional type, and pre-eminent among these is Grantham. Not far away is Newark, evidently by the same architect. Heckington is a particularly noble steeple of this type. It is of strong outline and fine proportions, and is one of those masterpieces which are independent of any added ornament for their beauty.

In the simple type of broach spire the lines of the broaches are satisfactorily carried down those of the spire to embrace the angles of the tower, and, whether seen in front or diagonal elevation, there was a complete unity between tower and spire. Not so with

the Parapet Spire.

The first effect of the parapet is to introduce strong horizontal lines between tower and spire. Its second is to cause a certain shrinking of the spire to allow a passage round its base. The third is still more important, and more frequent of future development. It results from the fact that, while the apparent breadth of the tower increases from the front and angle elevation in the ratio of the side to the diagonal of a square, that of the octagonal spire remains the same. Hence the spire which seems in correct proportion to the tower on front elevation appears too narrow and shrunken on the angle elevation, and the angle pinnacles in like manner appear to have moved away from it, leaving a disconnecting and awkward gap in the skyline.

The most evident solution of the difficulty, and the one that was at first attempted, was to make the angle pinnacles of the tower so massive and tall that the tower should seem to be carried up into the domain of the spire, and the pinnacles themselves should, on the angle elevation, appear to support the spire

and fill up the gap between its sides and the angles of the tower. These large pinnacles begin to appear, in fact, before the broach has quite disappeared, as at Heckington. Other fine examples are to be found in St. Mary Redcliffe, Bristol, and the western towers of Lichfield Cathedral.

The disadvantage of this arrangement is that the pinnacles tend to block the passage round the spire. At Oakham the pinnacles are connected with the spire by horizontal masses of masonry, which serve as bridges across the passage. It is the embryo of the subsequent flying buttress.

The Solution found at Salisbury.

The second method adopted was to keep the tower pinnacles comparatively low and subordinate them to an inner range which filled the space between them and the spire, as in the central tower at Chichester, or the more magnificent one of Salisbury. In fact, in this grand example the problem seems solved. The inner pinnacles are a mean between the outer pinnacles and the spire; and the eye, following upward the lines of the tower, passes by easy steps from angle pinnacles to inner pinnacles, and from these to the spire itself.

Yet the parapet is not sacrificed; the tower and spire retain their respective characters, and there is not that confusion between them which one finds sometimes on the Continent, as at Frieburg, St. Stephen's at Vienna, in which it is impossible to say where tower ends or spire begins.

An elaboration of this idea

is to be found at St. Mary's, Oxford. Here, in place of the tower pinnacles, each of the pair of buttresses at the tower angles carries an elaborate gabled and crocketed canopy over a sculptured figure, and the inner pinnacles are in two stages, with similar elaborate ornament, the whole combining with the spire lights to form a cluster of richly-decorated gablets and pinnacles, from the centre of which the spire rises.

This type of clustered spire reaches its fullest expression in the south flanking tower of the west front of Peterborough, in which graceful triangular spirelets rise between tower pinnacles and spire, having one side of the triangular base adhesive to the spire and the opposite angle carried by the tower pinnacle, and allowing a clear passageway beneath. The height of the spirelets is so arranged that their apex is on the line drawn from the apex of the tower pinnacles to that of the central spire.

In contemplating such an example as this one recognizes that the central spire is only one of a cluster, and has entirely ceased to represent the tower roof, as in such early broach spires as Frampton. It has, in fact, ceased to be an essential part of the tower, and has become only an ornamental accessory. It is, therefore, sooner or later, doomed to obey the inexorable law of extinction of useless members.

But there was

Yet a Third Way

of connecting angle of tower with spire, and one which became very popular with the Perpendicular architects. It was to put a small pinnacle at the tower angle and connect it with the spire by a flying buttress—a poor contrivance, but serving in some degree to carry the eye over the hiatus between tower, pinnacle and spire on the angle elevation.

The buttress abuts against the centre of the diagonal side of the spire, and seems sadly to lack articulation, and its particular forms suggests resistance to a thrust which, if it existed, would make short work of buttress, pinnacle and all. Higham Ferrers and Rushden may be taken as typical examples of this method, also Moulton and Whittlesea.

The magnificent steeple of Louth is the only one in which the flying buttress seems

worthy of its position—and the one at New-castle in which the flying buttress has run away with the spire!

The Octagon.

We now come to the fourth and last method of uniting tower and spire—by the interposition of an octagon. This occurs in its most rudimentary form at Abingdon, which consists in little more than setting the spire on an octagonal drum, and marking the junction by an embattled string.

At Exton a beautiful little steeple, amid beautiful surroundings of wood and park, affords an excellent example of the employment of the octagon. The tower pinnacles finish in miniature embattled octagons, which assist in harmonizing tower and spire, and giving breadth to the design. The octagon, however, seems so evidently to exist at the cost of the spire that the latter looks somewhat strangled by it.

But you will already have forestalled me and arrived at Coventry first. It is impossible to speak of the association of octagon and spire without immediately thinking of St. Michael's. Whilst elsewhere in the Perpendicular period they were more busy with towers than spires, the Coventry people seem to have reared their spire as a vindication of the spire and a protest at its increasing neglect. And a very noble steeple it is, although it excites our wonder as a *tour-de-force* as much as our admiration as a design. The truth is it looks a little too unstable; attenuation is written on every part; the octagon seems balanced on the tower, the spire on the octagon, and the weak ogee flying buttresses add very little to the sense of stability, and rise too high from the tower pinnacles, which are themselves weak in outline. The corona of open panelling at Patrington serves a similar purpose with the octagon, and may almost be regarded as such. A fine design is here marred by the ridiculous straddle tower pinnacles and their flying buttresses, and the poor belfry windows.

The Famous Perpendicular Spires.

That the Perpendicular builders were sensible of the value of the spire as a crowning feature of the design, the steeples of Coventry and Louth are sufficient witness, and they not infrequently erected timber and lead spires over towers which were otherwise complete without them, as, for example, the three towers of Lincoln.

As Northamptonshire and Lincolnshire, with Peterborough as centre, is the home of the spire, so Somersetshire, with Glastonbury or Wells as centre, developed

The most Important School of Tower Design.

although Norfolk and Suffolk may lay claim to many excellent examples. The Somersetshire type is sufficiently distinctive, notwithstanding considerable variation in individual towers, and it can be at once recognized. Of lofty proportions, these towers are usually divided into three stages by string-courses, and the buttresses, which are in pairs, are set in a little way from the angle of the tower, allowing the string-course to peep out, as it were, at the angle. The parapets are usually embattled, and have pierced traceried panelling, and occasionally, as at Glastonbury and Taunton, are very elaborate. In these cases the angle pinnacles are usually of open tracery work.

There are several fine towers outside the Somersetshire district which belong, more or less, to this type, as at Wrexham and Evesham. St. Neots, near Huntingdon, has an unusually fine tower for the district, with certain points of resemblance to the Somersetshire towers. But the strings and buttress weatherings do not line, the engaged pinnacle is of different design, and the belfry lights are insignificant, and go far to spoil the beauty of the design. The central portion of the parapet is carried up higher than

the sides in a manner peculiar to this eastern district, other examples to be found occurring at Huntingdon, St. Martin's, Stamford, and Wisbech.

Towers with Octagonal Lanterns.

There are a few towers carrying octagonal lanterns, as at Irthlingborough. At Lowick the whole design is of excellent proportion, and the octagon ends in a corona of pinnacles. But the grandest example is to be found at Boston, irreverently called "Boston Stump." The central tower, that crowning glory of the English cathedral, differs from those hitherto described in that it stands on four isolated piers hidden by the adjoining roofs. As a consequence the bold angle buttresses are dispensed with, as there is no support for them, and the tower rises to the parapet without a break in its vertical lines. A comparison between the central and western towers of Canterbury will emphasize this point.

Taper.

With the exception of the central towers, most of them have an upward diminution, not only to give them an air of stability, but, when they carry spires, to counteract the optical illusion of their spreading outwards at the top, due to slope lines of the spire.

This diminution is obtained in various ways: By setting in each stage on the string-course from the stage below, as in the Saxon towers and the lancet towers of West Walton and Walsoken; secondly, by the diminution of buttress projection, as in the vast majority of towers; and thirdly, by giving a batter to the tower or to the buttresses, or both, as at Market Harborough.

Small towers occasionally have no buttresses; the majority have pairs of buttresses, either exactly at the tower angle, as at Grantham, or set in a short distance, as in the Somerset towers; a less number have diagonal buttresses, while not a few have an octagonal thickening at the angles. St. Margaret's, Leicester, has diagonal buttresses set upon the usual pair of buttresses below.

Of the octagonal angled towers

Magdalen Tower, Oxford.

is a fine example. This tower also illustrates an important point in tower design—the severity and plainness of the lower stages, and the increase in lightness, elaboration and ornament towards the top. The fenestration of the Lombard towers followed this principle, and Giotto's campanile is an excellent example of it. Lancet towers, on the other hand, are frequently covered with tiers of arcading over their whole surface, which extend even round the octagonal angles, as at St. Mary's, Stamford and West Walton. Raunds has a unique decoration of zigzag weatherings, with the angles decorated by sunk quatrefoils.

The Staircase Turret

has already been referred to as stopping beneath the broach spire, or even below the belfry stage. Sometimes it is incorporated with the angle buttresses, as at Heckington and Grantham, in the latter case carrying a larger pinnacle than the other tower angles. At other times it projects boldly from the middle of the face of the tower, or near one angle, or at the angle itself, and stops below the parapet or is carried up above it. In the latter case it is often finished with an embattled top or spirelet.

Belfry Windows.

Next to the main lines of stages, buttresses, and strings the belfry windows claim our attention. They are, as it were, the eyes of the tower, and a tower without them, as that to be found at Ringstead, does not look intelligent.

Single belfry lights are to be found at all periods, from Polebrook and Heckington to York and Boston. These are often supported by blank panels at the sides, as at Denford

and Frampton, or, to take later examples, by the traceried panelling of St. Peter's, Derby, and Manchester Cathedral, restricted, in the latter case, to the space above the springing. But the general rule is to group the belfry lights in pairs.

The lights themselves may have heads of all shapes—obtusely lancet, ogee or square-headed, as at Aldwinkle St. Peter's. The transome frequently occurs, and occasionally the jambs and mullions are extended down below the sill to enclose a traceried panel, which may extend to the next string-course, as at St. Cuthbert's, at Wells.

The Stages.

The ringing stage usually has single and less conspicuous windows, although in some of the great towers and steeples there are double and of large proportions and elaborate ornament; examples of such occur at Coventry, Louth, Wrexham and Taunton.

The lowest stage of the tower facing west contains the grand door, for use on State occasions, with the west window over it, forming, in many cases, one composition with it by having its sill on the tower hood mould, as at Northleach, or being included within the same arched recess, as at Whissendine. Many of these west doors are very fine, as at Kettering and Middleton Cheney, and are worthy of independent study. In the Northamptonshire district the west door is recessed with a shallow porch, which further emphasizes its importance. Such occur at Higham Ferrers, at Rushden, and at Keystone. With this Mr. Bidlake brought his paper to a conclusion.

The Discussion.

Mr. G. Fellowes Prynn, proposing a vote of thanks, said he thought the spire, above all other Gothic detail, was the most beautiful; and although it was sometimes considered unnecessary and a luxury it was both exquisite in its form and beautifully symbolical. He regretted Mr. Bidlake had not mentioned the delightful little church at Loswithiel in Cornwall. As regards the wooden spire, beautiful examples existed at Barnstaple and Chesterfield, in both of which, however, the wood was much warped. The subject as a whole was intensely interesting, and he thought we might feel proud of our natural Gothic art and the development of the tower and spire.

Mr. Francis Bond, in seconding, regretted that Mr. Bidlake has not shown them any examples of his own draughtsmanship. He mentioned that the reason why one of the spires at Peterborough was more satisfactory than the other was because one was sixteenth-century work and the other fifteenth-century. At Lichfield they saw the same thing—fifteenth-century work trying to look like that of the fourteenth century.

Mr. Arnold Mitchell suggested that it might not be timber construction from which the spire started. In the history of architectural development they found that as the builders became used to their materials they abandoned perishable materials and began with stone. Their first effort was to roof the tower with stone, and he thought they must have begun with a pyramidal roof which was gradually elongated until it became a spire.

The president also spoke. Mr. Bidlake in reply said he had seen a plan of the Victorian tower at the House of Parliament, and he believed it was intended to be considerably higher. It was now disproportionate, and apparently the architect had to curtail his design through the parsimony of Parliament.

The lecture was illustrated by a large number of lantern slides.

The next meeting of the Association will be held on January 19th, when Mr. Lynn Jenkins will read a paper on "The Consideration of Sculpture by Architects."

Keystones.

A Discussion on Cheap Cottages in Rural Districts took place at last Thursday's meeting of the Society of Architects. It was opened by Mr. J. R. Manning.

A new Foresters' Hall at Debenham, Suffolk, has been built from designs by Mr. Raymond C. Wrinch, A.R.I.B.A., of Ipswich and Felixstowe.

Mr. Val Myer, A.R.I.B.A., of 14, South Square, Gray's Inn, has joined with Mr. John W. Fair. The firm will now practise at 39, Farnival Street, Holborn as "Fair & Myer."

At Woolwich Town Hall a statue of Queen Victoria by Mr. Pomeroy—a replica in marble of his bronze statue at Chester—was unveiled recently by the Duke of Connaught.

Beth Hamedrash—primarily intended for the study of Holy Law, but actually the Jewish ecclesiastical court—was opened last week. It is in Mulberry Street, Commercial Road, London, E.

The Brazen High Street of Kensington.—"Think of High Street, Kensington, of no more than ten years ago, and come and see the bloated, brazen, blithering, roaring, rampant highway that has taken its place," said Mr. Louis N. Parker at last week's meeting of the Society of Arts.

The "Gloucester Diary" for 1906 has just been issued by the Gloucester Railway Carriage and Wagon Co., Ltd. A new feature in the book is a "Director's Calendar" and a note on each day throughout the diary to enable the periodic recurrence of fixed engagements to be recorded, such as board or council meetings.

Mr. George E. Wade, the well-known sculptor, has received a commission for a statue of Her Majesty for the London Hospital. Mr. Wade is also entrusted with the execution of another statue of Her Majesty for Hong Kong. He is at present engaged in completing the panels of the Natal Volunteer War Memorial which is to be erected in Pietermaritzburg by the Natal Government at a cost of £7,000.

The Manchester Society of Architects held its forty-second annual dinner on Wednesday last, Mr. J. H. Woodhouse, president, in the chair. Mr. Ogden announced that the late Mr. A. W. Mills, architect, of Manchester, had left the Society £8,000 for the establishment of a home of its own. Toasts were given and responded to by Mr. Charles H. Heathcote, Councillor J. H. Thewlis (Lord Mayor of Manchester), Professor Capper, Sir James Hoy, Mr. John Brooke, Mr. Charles Hopkinson, Mr. Edgar Wood, Professor Schuster, Mr. J. D. Mould, Mr. A. S. Brewis, and the president. Mr. Edgar Wood expressed regret that one of the noblest of Manchester's possessions, the old town hall, was to be lost without any great effort being made to save it. Speaking of the same building, the Lord Mayor said he would have been extremely glad if this very fine example of Grecian architecture could be retained, but the City Council had to consider the good of the community, and it was absolutely necessary that Cross Street should be widened at that point.—At last week's meeting of the Society Mr. S. Harold Gibbons read a paper on the sketching of churches. He strongly advocated the making of large sketches, and discussed the advantages of plotting measurements on the spot. Two methods which were thought rather novel were the uses of a "fishing rod" and a two-foot rule, the first for obtaining heights of groined vaults and the latter for the plotting of the inclining angles of perspectives by holding one arm of the rule vertical and gradually depressing the other arm until coincidence was obtained—then transferring it to the paper.

New Buildings for the Marylebone Presbyterian Church, in Upper George Street, were opened last Wednesday by Lord Macnaghten. Mr. William Flockhart was the architect.

The new Workhouse Infirmary at Stepping Hill, Stockport, recently opened, will accommodate 340 patients. The cost is put at £130 per bed. Mr. W. H. Ward, of Birmingham, was the architect.

The new Infectious Diseases Hospital at Melton Mowbray was formally opened last week. The accommodation is for twenty beds. The total cost has been £9,000. Mr. Edmund Jeeves was the architect and Messrs. T. & H. Denman were the builders—both of Melton Mowbray.

Rothsay Harbour Buildings.—Designs have been prepared by Mr. James Miller, F.R.I.B.A., for the proposed reconstruction of the harbour buildings at Rothsay. These show an overhead promenade to accommodate several thousands of people, with a pavilion for use in wet weather. The total outlay is put at £10,000.

Reinforced Concrete was dealt with by Mr. T. J. Gueritte at last Wednesday's meeting of the Edinburgh Architectural Association (Mr. H. O. Tarbolton, F.R.I.B.A., president, in the chair). The lecturer referred particularly to the Hennebique system, and explained its uses, advantages and various applications to building bridges, foundations, reservoirs, &c.

A new Portfolio of Measured Drawings.—Mr. Charles H. Reilly, professor of architecture at the University of Liverpool, proposes to issue yearly, in folio form, a selection of measured drawings made by his students, somewhat similar to the Sketch-book of the Architectural Association, but with a cover of linen boards, either as a portfolio or as a bound volume. Professor Reilly sends us an example from the portfolio—the splendid building of the Customs at Dublin—accompanying which in the proposed volume will be three sheets of details. The first number of the publication will contain in addition a complete external survey of the Town Hall, Liverpool; the Senate House, Cambridge; the Palace of the Petit Trianon, Versailles; the Palace of the Grand Trianon, Versailles; the Orangery, Kensington Palace; and other smaller contributions. Considerable expense is entailed in the reproduction of these drawings, and Professor Reilly hopes to be able to count on the support of many architects, especially of those practising in Liverpool. The price to subscribers is 12s. 6d. a volume, and to the general public 15s. nett.

The Clarion Guild of Handicraft held its annual exhibition in the picturesque old hall of Clifford's Inn last week. At the opening of the exhibition on Wednesday Mr. Walter Crane said that artists nowadays had too strong a tendency to be fantastic, and in their desire for originality at times forgot the way to useful things and subjects. Mr. Selwyn Image observed that machinery had not done for the world what people thought it was going to do, and a growing number of people realized that it stood in the way of the millennium, instead of hastening it. The voice of John Ruskin cried aloud in the wilderness when he raised it against the effects of machinery upon human life. The practical common-sense man implored Ruskin to confine himself to his proper business of criticizing Turner and the Italian painters, and not to meddle with social questions. After Ruskin came Morris, who taught in a different way the same doctrine as Ruskin. It was in the spirit of the two great masters that this guild had come into existence. The studio-workshop of the London branch is at 48, George Street, Hampstead Road. Members pay an entrance fee of 2s. 6d. and a subscription of 6d. per week for the use of workshop and tools.

National Memorial to Queen Victoria.—The mound in front of Buckingham Palace is now being cleared for the foundations of Mr. Brock's work.

"Hints on Building a Church," by Henry Parr Maskell, has just been published from the office of "Church Bells," Tower Street, E.C., price 5s.

Herculaneum.—It will be remembered that some time ago Professor Waldstein mooted the scheme of excavating Herculaneum. The proposal is now under consideration by the Central Commission of Antiquities and Fine Arts at Rome.

A.A. Students' Smoking Concert.—The students of the Architectural Association will hold their second annual smoking concert on Friday, February 2nd, in the Georgian Hall of the Gaiety Restaurant. Any balance accruing will be divided between the Architects' Benevolent Society, and the musical society which is being formed in the Association.

Change of Addresses.—Owing to increase of business Messrs. Denny, Mott & Dickson, Ltd., timber merchants, have had to take larger offices at 13, 14 and 15, Fenchurch Street, London, E.C.—Mr. Paul Waterhouse has transferred his offices from New Cavendish Street to Staple Inn Buildings, Holborn Bars, W.C. Telegraphic address (as at present) "Ædilis, London." New telephone No. 2399 Holborn.

Birmingham Soldiers' Memorial.—Mr. Albert A. Toft, to whom was entrusted the task of designing the Birmingham Soldiers' Memorial, which is to be placed in Cannon Hill Park, has finished his work upon the group of statuary, and the casting in bronze is now proceeding under his supervision. It is anticipated that the memorial will be ready for unveiling next May. The stone pedestal will be 16ft. high and 20ft. in diameter at the base.

Egypt Exploration Fund.—The financial report of the hon. treasurer for 1904-05 states that the total expenditure was £3,215, while the assets on July 31st last were only £2,377. The deficit is due to the Fund having undertaken two expeditions and to the falling-off in the subscriptions from America. In future, therefore, the scope of the Fund's work will have to be brought within a more limited area. During the past season work has been carried on in two directions—by Professor Petrie in the Sinai Peninsula, and by M. Naville and Mr. Hall. Many interesting discoveries have been made by Professor Petrie, the most remarkable remains found being those of the temple at Sarabit. Sir John Evans now retires from the presidency of the Fund, after occupying that position for seven years.

Street Widening and Compensation.—An important question in reference to the widening of public streets when existing buildings come to be rebuilt was submitted for the opinion of counsel in London recently by the Corporation of Glasgow. In Glasgow it is contended that under an Act obtained in 1900 no compensation can be claimed unless the Corporation compel a house to be pulled down and rebuilt further back. If the rebuilding is done at the instance of the proprietor, then, if the building is in the new register of public streets, it is argued that the Corporation can insist on the new erection being put back to what the Master of Works has entered in the register as the fair and ultimate width of the street. The proposal of the Corporation was resisted by the property-owners, who maintained that the Master of Works should only enter in the register of public streets the actual width, and if the Corporation desired an ideal width they should purchase the requisite property.

A Bronze Statue of John Knox is to be placed in St. Giles's Cathedral, Edinburgh.

Mr. Mervyn Macartney is gone to South Africa to assess the competition for new law courts at Cape Town.

The Garden City Magazine is now published. It will be issued monthly from January 15th next and will be sent free to all members of the Association.

The T-Square Club.—At last week's first general meeting held at the Monico it was agreed to wind up the T-Square Club as at present constituted and to form a new club, the annual subscription to which will be one guinea; a half session of the club, however, is to be formed immediately after Christmas with a subscription of half a guinea. Mr. W. H. Webber, of 7, Great James Street, Bedford Row, W.C., is the hon. secretary. The first social evening of the club will be held on Tuesday, January 22nd.

Trade and Craft.

Combined Sprinkler and Fire-alarm.

An interesting demonstration was given on November 28th at the premises of the London Essence Co., George Street, Camberwell Green, London, S.E., of a combined sprinkler and fire alarm system which has been installed throughout these works. Several tests were performed to show the quickness with which the system detects and extinguishes an outbreak of fire. The first test took place in a room 26ft. by 25ft. by 12ft. 6ins. high. From the lighting of the fire the alarm sounded in 27 secs., and 10 secs. later four sprinkler heads attacked and extinguished the fire. In the second test in a smaller room the alarm acted in 23 secs., and 10 secs. later a sprinkler acted. A third test of a more severe character was performed in a covered way measuring 30ft. by 20ft. by 17ft. high, entirely open in front and partly open at one side. Notwithstanding a breeze blowing, the detectors acted in 17 secs. and three sprinklers in 57 secs. This shows how very quick this system is in action, a point of the utmost importance. This system is worked on an entirely different principle to the ordinary electric alarms, consisting of small tubing under pneumatic pressure. Any rise of temperature causes a stretched wire to slacken and release a suspended weight, which smashes a glass bulb inserted in the pneumatic tubes. This immediately relieves the pressure in the tubes and causes the alarm to sound. It is apparent that the system is superior to an electric one in so far as there are no electric wires to cause a danger of short-circuit and false-contact calls, while the severance of the tube does not mean the failure of other detectors on that circuit, as in the case of electric wiring. A valuable feature is that the expansion wire being placed on a metal plate which expands with a slow rise of temperature, the alarm will only be given with a sudden rise of temperature. The pneumatic alarm system seems to possess every good point that the electric systems do. Apparently its cost of maintenance is very low, and by an ingenious method of arranging the pipes it will show the particular floor where a fire occurs. The sprinkler has an arrangement of a falling weight which smashes a glass bulb very much in the same way as the alarm. The release of pneumatic pressure in the alarm tubes lets into the piping the water which had been held back by a valve. This overcomes the danger from frost to a system where the water is always in the pipes and does away with corrosion, while the water not being released until the alarm acts, no damage will result if a sprinkler head is accidentally opened. The address of the Expansion Sprinkler Syndicate, Ltd., is 58a, Fountain Street, Manchester.

NOTES ON COMPETITIONS.

Two more unsatisfactory Competitions.

FINE feathers make fine birds, but fine paper does not necessarily make fine conditions. The Education Committee of the King's Norton and Northfield Urban District Council has issued a set of conditions which leave nothing to be desired as far as external appearances are concerned. They are excellently printed upon stout paper, are handy of size, and, moreover, may be obtained free, i.e., no deposit is required. These circumstances make a perusal of the contents little short of pathetic. A school is to be erected in Raddle Barn Lane, Selly Oak, to accommodate 1,200 children, boys, girls and infants (400 in each department), at a cost not to exceed £14 per scholar. Firstly, no premiums are offered. Secondly, there is to be a duly qualified assessor, but he is to assist the committee in the selection of the designs. Thirdly, the commission will be at the rate of 5 per cent. on the gross cost of the buildings erected, but it is only intended to proceed with the infants' department in the first instance, and no sort of remuneration is offered on account of the deferred two-thirds of the work. Fourthly, the whole of the drawings, specifications, estimates and other documents connected with the accepted design are to become the sole and absolute property of the committee. Fifthly, the amount of work which is required of the architect, and for which no extra payment will be made, is excessive and unreasonable; he is to furnish such plans and tracings as may be required by the Board of Education, the Local Government Board, the King's Norton and Northfield Urban District Council and the contractor. Sixthly, there is an awkward clause governing the cost of the building, making the limit of expenditure vague, for it is stated that the cost of the building will be an important element in determining the competition. Furthermore, if it is found, upon opening the tenders, that the cost is in excess of the architect's estimate, he shall not be entitled to the execution of the work, nor shall he have any claim against the committee. The usual safety margin of 7½ or 10 per cent. is not provided for. This practically means that working drawings, specifications and quantities have to be prepared and tenders obtained before the successful competitor's design is accepted. Seventhly, the committee reserve the right to exhibit publicly only the designs recommended by the assessor. Eighthly, a rough plan of the site is provided, but its accuracy has to be verified by the competitors, and it carries no information as to levels. In addition to having to supply plans to the several bodies already mentioned, the successful competitor has apparently to find his own travelling and out-of-pocket expenses, for these are not mentioned in the conditions. An extraordinary clause is one which requires that proper attachments should be made in the heating apparatus (low-pressure hot-water system) at convenient places for the supply of hot water for cleaning purposes. The value of the water so obtained as a cleanser and the effect upon the heating system of drawing-off are, as is well known, most unsatisfactory. This is another instance of the folly of issuing a set of conditions without the aid and before the appointment of a properly qualified assessor. It is but fair to note that the statement that the assessor is to assist the committee in the selection of designs is in accordance with the R.I.B.A.'s "Regulations." The wording of this particular regulation is open to criticism, for if accepted literally by promoters it gives them the power to disregard the assessor's selection. This is the one weak spot in an otherwise good set of regulations for the conduct of architectural competitions. It is extraordinary

that the King's Norton authorities should advertise an open competition and issue conditions without requiring a deposit and yet not be able to supply an authentic site plan with levels. Do they think it reasonable to expect competitors to travel from all parts of the kingdom at their own expense, burdened with chains and levels, to obtain particulars at a cost which, if taken collectively, is comparatively enormous? A little forethought would have enabled them to have issued these particulars at about half what it will cost any individual competitor. But this is only another instance of the lack of consideration so constantly shown by promoters towards those whose services they are so anxious to obtain.

Proposed Carnegie Free Library, Beal Lane, Shaw, for the Crompton U.D.C.

If the case of King's Norton is pathetic, that of Crompton is absolutely humorous, for their requirements are so appalling and so unblushingly stated that they can only be regarded as "teeming with quiet fun," to use a Gilbertian phrase. This library is to contain, if possible, large reading-room, ladies' reading-room, boys' reading-room, reference reading-room, lending library to hold 15,000 volumes, librarian's room; and, in the basement, store-room, mending-room, lavatories, w.c.'s, and heating apparatus.

A flagstaff is to be fixed in some convenient part of the building. The roofs are to be covered with Ruabon red tiles. The reading-rooms are to have double windows. All internal joiner's work is to be of oak. The cost of this building is not to exceed £3,000. The Crompton Urban District Council have evidently been badly treated over a library on a former occasion, for they impress upon competitors the necessity of not forgetting the painting and the lending-library counter. The £3,000 is to include architect's and quantity surveyor's fees. In addition to providing a library at half its legitimate value, the successful competitor is expected to give his services for nothing. This is not actually stated—in fact a commission of 5 per cent., which is to include travelling expenses, is offered—but competitors are to state in their reports what amount they will allow out of this remuneration towards the salary of the clerk of works. A short calculation will show the humour of this requirement. £3,000—fees = say £2,800; architect's fee is 5 per cent. of £2,800 = £140; let the clerk of works salary = £110, and let out-of-pocket expenses = £30; therefore, the clerk of work's salary and out-of-pocket expenses equal together the architect's fee. One wonders what manner of man it is who sits upon this council. Be he a doctor, would he use his fee earned by attendance and physic to supply his patient with a trained nurse, a solicitor, and supply his clients with the services of counsel, a butcher, and pay the wages of his customer's cook? Even the first premium of £30 is to merge, so there is not even that left to buy paper and pencils with. It is printed in the conditions that the council "reserve the right either to themselves decide regarding the designs, to call in an assessor to advise them, or to reject the whole of the designs." At this point the council appear to have experienced a twinge of conscience; perhaps it was the sight of their split infinitive acting on their overwrought nerves, for appended to the announcement, in writing, are the words, "*An assessor will be appointed.*" It is anticipated that the dazzling prospect of speedily amassing a competence will cause the successful competitor to wander unwittingly from the path of rectitude, so he is warned in a manner reminiscent of the seaside apartment bed-head text, "No charge whatever in respect of commission must be made on the contractor." Here, as at King's Norton, disqualification is the penalty of an excess of the contractor's estimate over that of the

architect, who, in this contingency, will be subject to summary dismissal without remuneration. Also, it is necessary to verify the accuracy of the site plan and levels by a visit to Shaw, which is Oldham way. The inclusion of a flagstaff in the list of requirements is a master-stroke.

Preston Higher Grade School Competition.

A protest is contemplated in reference to this award. Any competitor desirous of being associated with the same can have a copy upon application to Mr. G. H. Willoughby, 3, York Street, Manchester, or Messrs. Edgar Wood & Sellers, 78, Cross Street, Manchester.

Perth City Hall Competition.

The report of Mr. Burnet, the assessor in the competition for the proposed rebuilding or reconstruction of the city hall at Perth, was considered by the town council in committee on December 7th. Dean of Guild Barlas moved that the Council resolve to adopt the reconstruction scheme. Councillor M'Pherson moved as an amendment that further information be got as to the relative costs of the successful plans. Lord Provost Cuthbert urged that the Council delay consideration for a month. On a division thirteen voted for the motion and eight for delay. The whole question will be discussed at the next monthly meeting of the town council.

A Northampton School Competition.

The Northampton Borough Education Committee recently invited competitive designs for a new Council school to be erected in St. George's Street and Royal Terrace. Twenty-five sets of plans were sent in and Mr. H. O. Creswell, F.R.I.B.A., was the assessor. The first place has been awarded to Mr. Matthew H. Holding, A.R.I.B.A., and the second place to Messrs. Herbert Norman and W. D. Gibbins. The building will accommodate 350 boys, 350 girls and 410 infants.

Correspondence.

Comparative Cost of Working Hydraulic and Electric Lifts.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—We read with very much interest the article in your issue for November 15th on the comparative advantages of hydraulic and electric lifts, and we consider that in the main it is an exceedingly fair statement of the question under discussion. We quite agree with the remarks about the suitability of hydraulic power for working lifts and cranes, but we think in one point the case for the Hydraulic Power Co. has been somewhat overstated, namely, as regards the comparative cost of motive power. We see that in the article a statement is adopted from Hydraulic Power Co.'s pamphlet to the effect that if the working cost of an electric lift is based on equal loads in both directions the variation in the cost, owing to greater loads ascending and less loads descending, may be increased by about 50 per cent. We venture to think that this is somewhat an overstatement of the case, because with an electric lift carrying five persons (or $7\frac{1}{2}$ cwt.) the balance weight would exceed the weight of the cage by about $3\frac{1}{2}$ cwt., and though the variation between the current consumption when running in both directions with full load, and when running up with full load and down empty, would amount, as stated, to about 50 per cent., it must be borne in mind that with a passenger lift the attendant will always be travelling with the cage; and assuming that a lad would weigh about 1 cwt., this means that the variation between the average duty and full duty would be reduced to about 25 per cent.

Beyond this, our experience teaches that the number of journeys under maximum conditions as suggested would probably not be more than about 10 per cent. of the whole

journeys, as in most cases probably about two persons and the attendant would be going up, and one person and the attendant coming down; there are also, of course, occasions when the duty will be less than the average.

We should think therefore that the variation above the balanced load would not really amount to more than 5 per cent. in the course of a week's running, instead of 50 per cent. as suggested by the Hydraulic Power Co. We would suggest that this consideration is one which should be rather urged by the Company than objected to by them, because one of the great points claimed for an electric lift is that the power consumed varies in proportion to the actual duty performed, but our view is that the difference between the maximum load and the minimum load is so comparatively small that this advantage is more theoretical than actual as regards its result on the year's current bill.

As we make a large number of both classes of lifts, we are of course in a position to take quite an impartial view, and in advising our clients in any question we should take into consideration all the circumstances of the case and advise accordingly. There is no doubt, however, that as regards cost of motive power electricity has a great advantage under present conditions, and this will be increased when current is supplied (as it will be next year in a great part of London) at a cost of only 1d. per unit.—Yours truly,

D. W. R. GREEN

LONDON. (for R. Waygood & Co., Ltd.)

King's Norton School's Competition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Referring to your notice in last week's issue on the competition for new council schools for the King's Norton Urban District Council, there seem to be two or three points which are a little unreasonable, namely, the successful competitor must furnish tracings for the Board of Education, the Education Committee, the Local Government Board, the King's Norton Urban District Council, and of course the usual builder's copy or copies—making at least five copies, all without extra charge. Although no premiums are offered the council claim the successful competition drawings. The assessor is appointed to assist the committee in judging the drawings, and I have heard privately that there is a section of the committee which is determined to support the assessor's award.—Yours truly, X.

A History of Architectural Development.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Whilst thanking you for the notice on my book in your issue for December 6th I venture to think that the words in parentheses in your last sentence are calculated to convey a false impression; a result which I feel certain you did not intend. They suggest that I have not "personally investigated" the work I write about. It is true that I have not seen the buildings of Egypt, Assyria and Persia, and I state this fact in my preface; but the descriptions and illustrations of these (including churches in Egypt and Syria) only take up sixty-four pages out of the 259 in the book. Of the buildings described in the remaining pages (Greek, Roman, Byzantine and early Christian) there are not more than half a dozen that I have not visited and studied.—Yours truly,

F. M. SIMPSON.

UNIVERSITY COLLEGE, LONDON.

[Our point was that Mr. Simpson had not personally investigated the sources which alone can enable an adequate view to be obtained of early Grecian, Roman, Byzantine and Christian architecture, and for this reason he has given an inadequate account of the beginnings of architecture, but this first volume contains much that is valuable, as we said in our review.—Ed. B.J.]

MANCHESTER NOTES.

(By our Own Correspondent.)

The Unemployed.

THE leading article on "The Unemployed and the Building Trades" in THE BUILDERS' JOURNAL for December 6th is particularly opportune and of much local interest. With the exception of London, perhaps, there is no district in which more is being heard of the unemployed than at Manchester. We have had frequent meetings in the principal square, processions, and a dramatic collision with the police, which was not altogether above suspicion. Election meetings have been invaded and upset by labour men and socialists, the labour representatives in the City Council are insistently and violently advertising their cause, and the newspapers contain their contributions almost daily. Yet, judged by any test which can be applied, the unemployed question is far less acute than in most years. Excepting the building trade, almost all branches of trade in this neighbourhood are good and are still improving. Some recent cases deepen the unpleasant suspicion that the present agitation is partly the work of clever organizers, who see in the wave of public sympathy and in the political conditions of the moment a good opportunity to further their socialistic ideas. If honest and hard-working traders are not to be crushed out of existence by the cost of free breakfasts, extravagant labour schemes, and the like, a firm stand must be made and a drastic system of investigation and classification insisted upon. At the last meeting of the Manchester City Council the question came up in the form of a proposal that an area of land on the Corporation's Blackley estate should be laid out and streets formed to provide immediate work for the unemployed, and to extend the housing scheme of the Corporation. So far this scheme has proved to be a huge financial failure, a result which supports the Birmingham and Glasgow authorities in their contention that it is sufficient for the municipality to demolish old insanitary property; the demand for new houses invariably creating an ample supply. In spite of a violent speech by one of the labour members, the housing part of the proposal was defeated. In Salford the River Irwell Conservancy Committee will find employment for 200 men for fifteen weeks in the extension of the filter area of the sewage works.

With the new year it is to be hoped that the builders and contractors may obtain a share of the general improvement, but the hope does not receive much support from a round of interviews with the principal architects. Few, indeed, are able to report even the average run of good building contracts in prospect.

Granite for South Africa and New Zealand.

A distinctly new incident in local trade is the shipment by Messrs. Kirkpatrick Brothers, of the Manchester Granite Works, Trafford Park, of about fifty cases of polished granite for Johannesburg. The granite is supplied to the order of Messrs. McIntosh and Moffat, of that town, for the new offices of the National Mutual Assurance of Australasia. Messrs. Kirkpatrick Brothers also have in hand a large polished granite pedestal for the statue of Sir John Logan Campbell to be erected in Auckland, and a number of other monuments, of various designs, for shipment to New Zealand. The local development of this hitherto strictly Aberdeen trade is due to the shipping facilities offered by the Manchester Ship Canal.

Builders' Notes.

Tenders for the Erection of Liverpool Cathedral will be invited shortly.

Sunderland and District Building Trade Employers' Association.—Mr. W. B. Cooper has been elected president of this Association.

Messrs. Colledge & Bridgen, of Midland Works, Wolverhampton, have recently supplied more than 10,000 of their locks and furniture, and 500 sets of their fanlight gearing (to open 1 to 9 lights per set), for the new barracks on Salisbury Plain.

Messrs. Mellowes & Co., Ltd., of Corporation Street, Sheffield, and 28, Victoria Street, Westminster, have secured the order for supplying and fixing their patent "Eclipse" roof glazing on the extensions of the Ordnance Works at Coventry, Messrs. Cammell, Laird & Co.'s works at Sheffield, and extensions to Crewe Station for the London and North Western Railway.

Midland Plastering Co., Ltd.—This company, formed six years ago by the principal Nottingham contractors during the dispute with the operative plasterers, has just held its sixth annual general meeting at the registered office at Pentinck Buildings, Nottingham, when a very satisfactory report was laid before the members. In spite of the very quiet state of the trade in the district, good progress has been made, not only in the original branches of plastering and building materials, but also in the new branch of mosaic work and wall and floor tiling (carried on as the Midland Art Paving Co.). The directors were able to declare a dividend of 10 per cent. for the fourth time, besides carrying forward a substantial sum to the current account. The retiring directors consented to remain in office for the coming year.

Engineering Standards Committee: Progress of Work.—A booklet has just been issued by the Engineering Standards Committee setting forth the progress of the work from January, 1901 to July, 1905. The sectional committee on steel for bridges and building construction have drawn up a standard specification, and the draft has been submitted to the Science Standing Committee of the Royal Institute of British Architects, and will, it is hoped, be ready for publication soon. The sub-committee on cast-iron pipes for water, gas, electrical and sewage mains and the sub-committee on such pipes for heating, ventilating and house drainage are both engaged in drafting a series of standard sizes. A series of standard sizes for smoke pipes is also under consideration. The standard specification for Portland cement was issued last December. The offices of the Committee are at 28, Victoria Street, S.W.

New Companies.

SCARBOROUGH ESTATE, builders, &c. Capital: £5,000.

MERSEY BUILDING CO., LTD. Capital: £500.

BEDWORTH BRICK CO. Capital: £6,000.

MILBURN ESTATES, LTD., builders and contractors, &c., Newcastle-on-Tyne. Capital: £300,000.

COLLAS PORTLAND CEMENT CO., LTD. Capital: £52,500.

WEBER STEEL-CONCRETE CHIMNEY CO., LTD. Capital: £10,000.

LONDON AND PROVINCIAL FREEHOLD AND LEASEHOLD PROPERTY INVESTMENT TRUST, LTD., builders and dealers in building materials. Capital: £50,000.

THAMES STONE CO., LTD., to acquire the business carried on by G. Briggs at Corporation Wharf, Barking, and to carry on the business of granite and stone merchants, &c. Capital: £5,000.

ADVANCE ENAMEL AND VARNISH CO., LTD., to acquire and carry on the business of enamel and varnish manufacturers, &c., carried on by T. Pittman at Plymouth. Capital: £15,000.

LISCANNON QUARRY CO., LTD., to adopt an agreement between W. Kevan and T. W. Kniveton for the acquisition of the right to quarries of stone and flags on four acres of land in the Barony of Corcomrie, co. Clare, Ireland. Capital: £10,000.

MONTHLY

FIRE SUPPLEMENT

TO THE

BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

[Number 15. December, 1905.]

NEW BUILDING LEGISLATION.

ON January 1st a considerable portion of the new Building Act Amendment Act comes into force. We would remind our readers that it is this year, 1905, that has seen the most important piece of retrospective legislation ever enacted in this country in the interests of fire-protection, and more particularly safety of life from fire. It is a sign of the times, and the increasing interest in matters of fire-protection; that this new Amendment Act should have become law; and it is a matter for congratulation for all who worked in the interests of fire-protection in the past decade that a remedy has at last been found for the worst of the evils that have resulted from thoughtlessness and negligent building of the past as far as safety of life is concerned.

The Battle to attain this Act

has been a long one. It practically dates back from the great Charity Bazaar Fire of Paris in 1897, in which so many lives were lost at a private entertainment and the eyes of all were opened to the risk to life from fire even on street-level if there is an insufficiency of exits. The lesson of the Charity Bazaar fire was accentuated by a series of conflagrations in the London City area, namely, those of Cripplegate, Barbican, &c., which showed what risks existed, although, fortunately, no loss of life occurred at any of these great fires. Then came the Queen Victoria Street fire in the very centre of the City, and the energetic proposals thereupon made by various persons and bodies calling for retrospective legislation. Thereupon came the International Fire Prevention Congress in London and the general energetic propagation in the direction of improved fire-protective enactments not only for the Metropolis but the whole country. Bills were put forward from time to time by the London County Council and the Corporation embodying the latest views of those most conversant with the subject, and, finally, the last week of the Parliamentary session just closed gave London what it has long needed in spite of the unseemly opposition of many interested parties, primarily representing the property owners.

Retrospective Legislation.

The success of the battle to attain this legislation heralds similar successes for retrospective legislation in other parts of the country—probably for the whole of the United Kingdom outside the Metropolis, now legislated for. It will probably take another decade until this retrospective legislation is universal for the United Kingdom, but it is bound to come, and such sad calamities as we have recently had at Glasgow, with its long death roll, must gradually impress even the property owner who has to meet the cost of the improvements as to the absolute necessity of safeguarding human life even if the expense involved be a heavy one.

The first stage of retrospective legislation

having been achieved as far as safety of life in London is concerned for the Metropolis, it is to be hoped that the Select Committee appointed last year will take a similar view as to what is necessary outside the Metropolis. Further, it is to be hoped that the impending proposals of the London County Council for the improvement of buildings generally may have a fair hearing at the earliest possible moment in Parliament, and that particularly those that refer to the sound and fire-resisting construction of buildings will also soon be put on the statute book.

A new Bill for 1907.

The Building Act Amendment Act as passed did not contain much that was of a fire-protective character outside the actual question of safety of life. By mutual consent the parties advocating and opposing the Building Act Amendment Bill as originally presented limited the measure to questions of escape from fire, and thus the purely structural questions were deferred. That the fire-preventive questions put forward in the last Bill will have a hearing in the Parliament in 1907 is practically certain, but that the Building Act of 1894 requires very many of the amendments, as far as construction and fire-prevention are concerned, is obvious; in fact, since the last Bill was drafted further amendments have become necessary in the direction of legislation for steel-frame buildings, for reinforced-concrete buildings, for temporary buildings of the tent type, and last, but not least, the roller shutter door which is so necessary in many factories where sliding doors are all too inconvenient.

Tardy Reform.

It is regrettable that so long and so tedious a procedure should always be necessary to attain an obvious and necessary improvement for the Metropolis where a building question is concerned, and it is, further, all too regrettable that matters of this kind should be very much made a question of party rather than being treated on their own technical merits. The Amendment Act as passed was almost endangered at the last moment by an eminent member for an Irish constituency—having no interest whatever in a London building question—opposing the passing of certain Bills merely as a protest in respect to some grievance of his own. This is not as it should be, and the sooner that the Parliamentary procedure is modified as far as technical questions are concerned the better for the community at large and the prosperity of the nation.

Sound building, safe building and fire-resisting building are questions of technical importance to the community at large, entirely outside party politics; they are economical necessities, and the sooner it is realized that such matters can well be treated in a different manner than is the case at present the better for all those interested in architecture and building. The whole procedure, too, of attaining an improved enactment is too

expensive, too complicated, and we might almost say at times too ridiculous to meet the requirements of a modern age.

Activity for the Architectural Profession.

Turning to the direct interests of architects and the building trade, we naturally see in the new enactment considerable activity in work for both. In many cases it will be possible to alter existing buildings to meet the necessary requirements of the Act, but in many also it will be more economical and more far-seeing on the part of property owners to rebuild entirely to meet the new requirements, as also those of the new era of convenience, luxury and sanitation generally. If we merely mention that every existing building exceeding 30ft. in height is affected by the Act as from January 1st; that every projecting shop where the projection exceeds 7ft. is affected; that all living-rooms over premises used as oil shops are affected; and, lastly, every existing building having more than two storeys above the ground storey—it will be realized that there will be some work to be done.

After January 1st, 1907, there will be a further requirement coming into force as to all buildings in which more than twenty people sleep, which naturally will affect the large private houses where a number of domestic servants are retained. After this date, too, all existing high buildings—i.e., buildings that have a floor 50ft. above the pavement—will be affected. This practically means that, more or less, nearly every building in London will be affected where it does not happen to be a dwelling-house of moderate size occupied by one family.

As to the provisions for new buildings, they are not of such great interest at the moment, as it is naturally a matter of course that new buildings erected should meet modern requirements. It is the retrospective clauses that are those which will be most far-reaching in effect, as far as London is concerned.

Water-supply for Fires in London.—Architects should be pleased to learn that the Metropolitan Water Board have decided that the restrictions which hitherto prevented the extra use of the London hydrant supply of high-pressure water for fire-extinguishing will be withdrawn. Architects will often have encountered the great difficulty of providing water for fire-extinguishing purposes for tall buildings such as the upper floors of hotels, flats and theatres, and all manner of ingenious devices had to be resorted to in order to obtain the necessary pressure. In future it will be possible for any one to have a hydrant pressure apparatus fitted from the Hydraulic Water Co.'s mains. We are glad to see that the Metropolitan Water Board have, by waiving the unnecessary restrictions, materially assisted in the fire-preventive policy for the tall buildings of the Metropolis, and credit is due to them and their advisors in this matter.

GLASGOW LODGING-HOUSE FIRE.

IT is with great regret that we have to record the fatal lodging-house fire that took place at Glasgow in No. 2 Lodging-house, Watson Street. It is sad that so lamentable a catastrophe should occur in any city, but it is particularly regrettable that it should have occurred in Glasgow, a city which in many directions has done much in the interests of fire-prevention and in which fire-protection received far greater attention than is the case in many other centres.

Glasgow is a municipality which has been presided over by a succession of provosts—all energetic workers and most of them particularly interested in matters of fire-prevention. The late Provost Primrose ranks high amongst these. The city has also had its municipal fire-service presided over by a sequence of highly painstaking baillies, among whom we would specially mention Baillie Cleland. And, lastly, it has had the advantage of the services of a chief officer who, in training and feeling, has always given the greatest possible importance to questions of planning and building construction from a fire point of view, and has always treated his subject on advanced lines.

Glasgow has enjoyed a Fire-Prevention Act which has brought with it material improvements, but unfortunately it has nothing of a retrospective character as yet to deal with buildings such as the lodging-house that has been the subject of this calamity or even with buildings of large cubical contents. Having regard to the interest Glasgow has always shown in matters

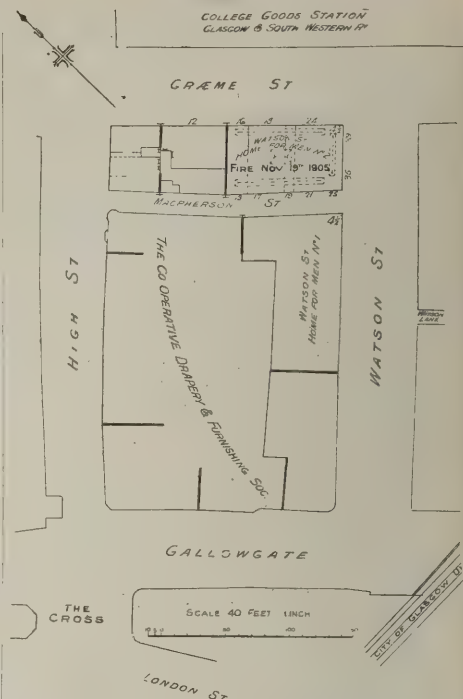

of fire-protection, it is extraordinary—and we think not quite creditable—that this question of safety from fire in lodging-houses should not have had the attention it has long called for; and if we here in these columns record a fire with a large loss of life we would immediately mention that a similar fire can at any moment occur in a similar lodging-house but a few yards away (see plan), and we have no doubt there are others of very similar construction in Glasgow.*

900 Lives at Risk.

The lodging-house which was the subject of the catastrophe could hold nearly 400 occupants; the one a few doors off would hold over 500. To put it quite plainly, about 900 lives have been regularly at stake nightly in these two buildings, built on most extraordinary lines for the class of building they professed to be, and the result has been thirty-eight deaths. The only remarkable thing about the Glasgow lodging-house fire is that the deaths were not far more numerous, and, further, that such fires have not occurred earlier in the two buildings in question. It does the greatest possible credit to the Glasgow Fire Brigade and their fire-master that there should not have been a greater loss of life at this fire; in fact, we would say it is a matter of the greatest good fortune to the city of Glasgow that the list of deaths was not quadrupled. This would certainly have been the case had it not been for the energetic manner in which the fire brigade dealt with the emergency.

We publish in these columns a plan† of

* The site plan was kindly prepared by Mr. Charles E. Goad, C.E.
† The third-floor plan has been kindly provided by Mr. Paterson.

LOCATION OF THE TWO LODGING-HOUSES. the building and some photographs. The plan is one of an upper floor, namely, the third floor. We are unable to give the ground-floor plan, which, if read together with the one published, would indeed have made curious reading; for although the plan shows a large floor with a central staircase, we must try to explain that only a portion

SECTION ON A. B.

NO. 2 LODGING-HOUSE, WATSON STREET, GLASGOW: PLAN AND SECTION OF THIRD FLOOR.

THIRD FLOOR.

PORTION OF ATTIC FLOOR SHOWING ARRANGEMENT OF CUBICLES.

of this floor area belongs to the lodging-house proper when you get to ground-floor level—only, in fact, that portion which faces Watson Street—the other portion being let off for a public-house and a shop (see site plan). So we see that, apart from a lodging-house risk, there is a very considerable risk of two other independent occupants.

The Sole Approach

from this portion of the ground floor to the upper storeys was by means of a single flight of stone stairs leading to the staircase proper, shown on plan, and here we would immediately mention a point which has apparently not been given quite the attention it deserves, namely, that at this staircase there was an iron gate, used for the purpose of locking up the lodgers. This iron gate was actually locked at the time of the outbreak of the fire, and had it not been for the presence of one of the attendants housed in a room near by, and who attended to this gate and unlocked it when there was already a crowd of struggling men trying to get down the stairs and through this gate, there would have been one of the most terrible holocausts that Europe has ever seen.

The building which faced Watson Street, from which thoroughfare it had its main entrance, was a building comprising a basement, a ground floor, a third floor and an attic floor under a Mansard roof. The floors from floor to ceiling were respectively of the following heights, namely:—Ground floor, 14ft.; first floor, 13ft.; second floor, 12ft.; third floor, 10ft.; attic floor, 8ft. On one side of the building there was a thoroughfare; on the other side an alley. Thus on three sides it faced the open. The total dimensions of the building were about 50ft. frontage to 50ft. depth. From this depth, however, quite half must be deducted from the ground floor as being utilized in other occupancy for the public-house and shop referred to above.

The Ground Floor

was only used for an eating hall and recreation-room. On the first floor, part of the area was used as a recreation-room. The beds, which were on all floors except the ground floor, were arranged cubicle fashion, hit and miss, as indicated on the section illustrated. Each cubicle had its own separate entrance, and could be bolted from the inside by the occupants. The walls of the cubicle did not reach up to the ceiling, a foot or two being left for air-space, and this space was filled with wire-netting. The whole of the cubicle construction was simply of matchboarding; the ceilings were lined with matchboarding; the matchboarding was varnished. Generally speaking, it would be difficult to arrange anything more inflammable than this.

THIRD FLOOR, IN WHICH FIRE ORIGINATED AND WAS CONFINED.

UPPER OR ATTIC FLOOR SHOWING MANSARD ROOF.

On the Night of the Fire

the warder apparently had a room on the first floor. The cubicles were fairly well filled on the night in question, and the house was closed about 11 p.m. The alarm was raised about 5 a.m. in the morning, when the inmates naturally bolted for the staircase, which they found closed at the bottom by the iron gates referred to, and it was this that had to be released by the warder, who had access to them from a small side staircase, not shown on plan, leading from the landing to the first-floor recreation-room.

As to the actual outbreak of fire, the cause has not yet been definitely ascertained, but it resulted in a general stampede, and for such a stampede the exit accommodation was quite insufficient, there only being the one central stone staircase and no special arrangement of emergency exits of any description whatever—not even an emergency exit on to the roof.

There is one lesson perhaps that should be learnt, and that is that there is a great dislike on the part of some lodgers in houses of this kind to turn out of their cubicles. In some cases they consider they are being hoaxed by an alarm of fire with the view that the confusion created would facilitate thieving. On the other hand, there is also a dislike on their part to leave their clothes and possessions in the cubicle, which are generally their very all. The peculiarities of the inhabitants of different classes of dwellings must also be taken into consideration when such habitations are being designed.

The absence of additional staircases naturally also hamper very considerably the work of the fire brigade, as such additional staircases are not only means of exit but of assistance to the brigade's work.

The photographs explain themselves and tell the sad tale. The lesson of the fire is, of course, obvious, but the sooner it is generally appreciated the better.

COMMON LODGING-HOUSES IN LONDON.

ARISING out of the Glasgow fire, the question has naturally been raised how London is provided for in the case of an emergency in one of these buildings, and we therefore publish an extract from the Proceedings of the London County Council in which the Public Health Committee reported upon the matter to the full Council. The extract will clearly show the position and the trouble that is being taken in the Metropolis to improve what was some few years ago a disgraceful state of affairs:—

"In the administration of the law relating to common lodging-houses in London we were impressed some years ago by the danger to the lodgers in the event of a fire breaking out at some of the premises, and this was one of the considerations which led us to recommend the Council to apply to Parliament for authority to require that no house should be used as a common lodging-house unless the keeper obtained annually a licence from the Council for that purpose. . . .

"By the London County Council (General Powers) Act, 1902 (Part IX.), the Council obtained the legislation necessary for the purpose. . . .

"The Council delegated to us the exercise of the licensing powers conferred upon it by the Act, and we have during the last three years dealt with all the common lodging-houses in London as regards the means of escape in case of fire, and the works which the Council has considered necessary have in nearly all cases now been completed. In the preparation of these requirements the architect and the chief officer of the London Fire Brigade have made inspections of the houses, and have advised us thereon. There are at the present time 281 houses accommo-

dating 24,511 men, 44 houses accommodating 2,303 women and 13 houses with accommodation for 310 married couples. . . .

Not easy to deal with.

"It has not been easy in dealing with houses of the class in question to devise means of escape which, while reasonably sufficient for the purpose, could be carried out without involving prohibitive expense. We have given every consideration to any alternative proposals or suggestions made by the keepers of the houses, and we recognize with satisfaction the efforts which the great majority of the keepers have made to carry out the required works. Our general practice has been to insist upon an alternative means of escape in case of fire being provided from rooms licensed for lodgers, and this has necessitated the construction of new staircases in a number of the larger houses and of external balconies and step ladders in others. In several instances it has been possible to obtain the alternative means of escape by making openings between adjoining houses. In cases in which the provision of means of escape by the roof has been allowed, we have required guard-rails to be fixed. Other requirements have had relation to the protection of staircases when necessary, the re-hanging of exit doors so as to open by pressure from the inside, the removal of inflammable material stored in dangerous positions, notices as to the position of exits and nearest fire-alarms, the provision of fire-extinguishing appliances, and the lighting throughout the night of means of exit. In dealing with houses accommodating women, we have especially felt it necessary to secure that the alternative means of escape shall be readily accessible and such as women would have no difficulty in using. . . .

"We shall, of course, take steps to ensure that the means of escape and the fire-extinguishing appliances provided at the houses shall be kept in good condition and efficient working order, and a by-law which requires this is included in the series recently made by the Council."

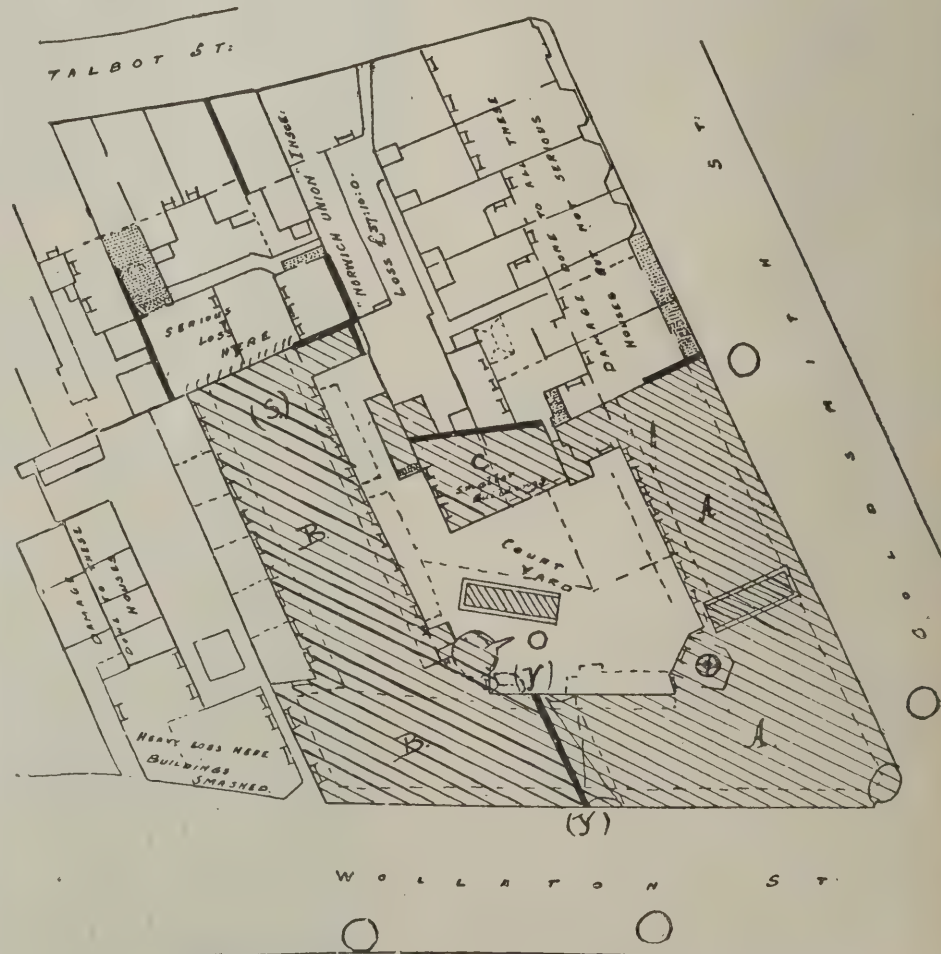

The By-law for Common Lodging-houses in London is as follows:—

"Every keeper shall keep and maintain in good condition and repair and in efficient working order all means provided for the escape of the inmates of the common lodging-house in case of fire. The keeper shall cause fire-extinguishing appliances which shall be reasonably sufficient to be kept constantly charged and available for use on each floor of the common lodging-house.

"The keeper shall not use or suffer or permit to be used in any part of a common lodging-house into which lodgers are received any lighted candle or any lamp supplied with paraffin, mineral or other oil or spirit for lighting, heating or cooking purposes, unless such candle is properly protected or such lamp is so constructed, protected and secured as not to involve risk of fire to the house or its contents.

"Every keeper shall cause all gas-burners in a common lodging-house to be protected where necessary by glass or wire globes, and shall also cause all gas-burners within 3ft. of an inflammable ceiling in any such house to be fitted with consumers to distribute the heat.

"The keeper shall not store or keep, or allow to be stored or kept, any paraffin, mineral or other oil or spirit or matches or any explosive substance in any cupboard or other space situate under any staircase in a common lodging-house."

PLAN OF THE WHITEHALL FACTORY FIRE, NOTTINGHAM.

THE NOTTINGHAM FACTORY FIRE.

BY the courtesy of the editor of the "Norwich Union Magazine" we are enabled to publish a plan and small photograph of the great fire at Whitehall's Factory, Nottingham, and also by the courtesy of the editor of the "Sprinkler Bulletin" a large photograph of this fire.

The fire was one of considerable importance, and regrettable, inasmuch as the actual loss in cash values is estimated at between £50,000 and £70,000, while some 300 or 400

RUINS OF THE NOTTINGHAM FIRE.

workpeople were thrown out of employment for a considerable period. The factory was originally constructed as a lace factory, but was afterwards adapted for various industries, i.e., let out in parts, one part being used as a motor works. It is said that there was no petrol in the building, but such statements must be taken with a grain of salt. The local brigade was called to the fire at 5 o'clock a.m., but owing to the faulty construction and planning and the general inflammability of the contents, it was obvious that the loss would be a total one from the outset.

As to the fire insurance aspect of a fire of this kind, it is very interesting to read in the "Norwich Union Magazine" that the following is the insurance object-lesson. The insurance contributor of that journal writes:—

"(1) We shall have seen that in an 'omnibus risk' of this kind we must be prepared for a serious loss and possibly for the complete destruction of the whole of the premises;

"(2) That party-walls where there are lantern attics on both sides must not be regarded as altogether creating a separation of risk; and

"(3) That there is the additional danger to be feared that in order to keep matters quiet the fire brigade may not be summoned until after efforts have been made by the caretaker or others to extinguish the fire.

"How then, it will probably be asked, should we treat insurance proposals on this class of risk?"

"To this I would say—

"(1) That before issuing a policy we should be satisfied that the landlords have exercised proper care in the selection of their tenants, and, if possible, we should also by inspection ascertain for ourselves that such tenants are desirable and eligible for insurance;

"(2) That the maximum rating current for the risk should be obtained;

"(3) that in fixing the retention the whole of the premises should be regarded as at one risk; and

"(4) That a condition should appear in the policy to the effect that on a fire being discovered by the assured or any of his employees notice should be instantly given (by telephone if possible) to the chief fire-brigade station."

FIRE TESTS WITH A MODEL THEATRE.

AT the instance of the Society of Civil Engineers and Surveyors of Vienna some extensive tests have been undertaken in consultation with specialists interested in theatre protection from all parts of Europe. The Local Government Board and Municipality assisted in these experiments in every possible way, and the invitations issued to participate in them and to co-operate in the conference on the experiment were issued by the Government Department, and the President of the Local Government Board presided on both tests and consultations.

The tests took place in a model theatre specially erected by voluntary contributions, the local authority subscribing £500. The model theatre was one-third full size—or, to be exact, the erection of the stage and the auditorium was to one-third full-size, exclusive of corridors and the like. This model theatre was to be tested with a view of giving facilities for studying the effect of an outbreak of fire under five different conditions, and above all to indicate the effect of the proper ventilation of a stage, and the effect of the lowering of the fire-resisting curtain combined with ventilation. The theatre

had been erected from designs of a well-known firm of Austrian theatre architects, Messrs. Felner & Helmer, and the tests were conducted by a sub-committee of the society named above in the presence of the various public officials interested and of the representatives of foreign societies and bodies participating in the work.

The result of the tests, which took place on November 22nd, will be officially reported upon in due course, as also the result of the conference of the local sub-committee and visitors; but in the meantime we are able to give the following preliminary report, which will give some idea of the nature of the building under test, the arrangements of the tests, and their effect. It is pleasant to record the great interest taken by the local authorities in these testing operations, and the way they assisted in them, both actively and financially, whilst actually undertaken by a sub-committee of a private professional association. And it is also pleasant to know that the visitors who attended in Vienna were most hospitably received by the mayor and other local officials, and entertained both on the day of the tests and the following day of the conference.

Particulars of the Building.

The stage was 6 m. deep, 7'50 m. wide and 6 m. high to the grid-iron level. The proscenium opening was 3'35 m. wide by 2'60 in height. The adjoining auditorium,

THE WHITEHALL FACTORY FIRE, NOTTINGHAM.

designed as a one-tier house, had a width of 5'50 m., a depth of 7 m. and a height of 4'25 m. The auditorium was provided with a ventilation opening on the ceiling and the stage with a central ventilation outlet, and also four ventilators in the four corners. The back part of the auditorium had polished wire-glass windows to enable a good view of the tests to be obtained.

First Test.

(Disadvantageous conditions).—With no safety curtain and no stage ventilators working. All ventilators on the stage closed. Ventilator in the auditorium half-open. Cloth curtain down. Gas, candle and oil emergency lamps alight. Electric emergency lights in use.

Fire started on stage. When a small door was opened on the side of the stage the fire flamed up and broke through the curtain with considerable force. The curtain was drawn into the auditorium. Gravel strewed on the auditorium floor was scattered far and forced into the open through the exits which were blown open (outwards).

The emergency gas, candle and oil lights, all went out, and the emergency electric lamps could not be seen owing to smoke.

The temperature on the stage had reached 400 degs. C.

Second Test.

(The working of the iron fire-resisting curtain under unfavourable conditions.) All ventilators on the stage closed. Ventilator in the auditorium half-open. No cloth curtain down. The iron curtain is let down after the starting of the fire. Lights as before.

Fire started. The fire beat into the auditorium in strong flames, and on the letting down of the iron curtain the flames passed below it (long-pointed flames). When the iron curtain was fully down it was possible to enter the auditorium. The smoke in the auditorium was quickly drawn off through the ventilator. All emergency lights had gone out excepting the electric emergency light.

Third Test.

(Working of the stage ventilators without fire-resisting curtain.) All ventilators on the stage are opened after the fire started. Ventilator in the auditorium closed. Curtains remain up. Lights as before.

Fire started. The fire burnt quietly. It was at first possible to remain in the auditorium, but eventually this became impossible. The smoke was drawn off from the stage through stage ventilators. All emergency lights remained burning.

Fourth Test.

(Working of the stage ventilators with the iron fire-resisting curtain—favourable condition.) The ventilators on the stage are opened during the progress of the fire (partly automatically, partly by hand). The iron curtain is let down after the fire has broken out. Ventilator in the auditorium remains closed. Lights as before.

Fire started. Smoke was drawn off through the stage ventilators. The air in the auditorium is only slightly vitiated, and it is possible to remain in the auditorium. All emergency lights remained alight.

Fifth Test.

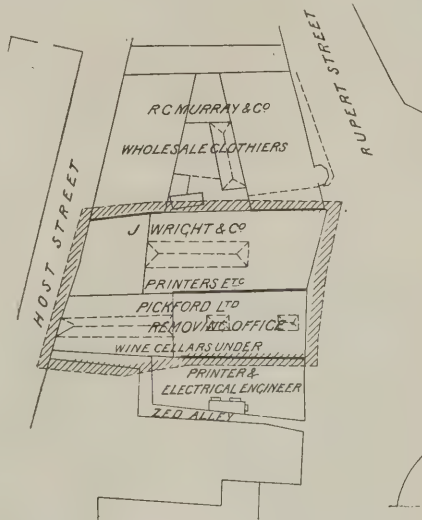

(Working of the stage ventilators in conjunction with a sprinkler installation.) The ventilators on the stage opened during the fire. The ventilator in the auditorium kept closed. No curtain lowered. A sprinkler installation on the stage brought into operation. Lights as before.

Fire started. Smoke was drawn off through the opened ventilators. After a short time the sprinkler installation began to operate and the fire was extinguished. It was possible to remain in the auditorium. The emergency lighting remained alight.

THE BRISTOL FIRES.

THE two fires at Bristol which were recorded in a previous "Fire Supplement" have raised a considerable commotion in that city as to the necessity of fully applying the existing regulations as to the separation of buildings. In each case it will be remembered that the fire spread from one building to another, and that the money values lost in the buildings affected were in both cases materially in excess of those of the buildings in which the fires originated.

As it happens, Bristol is, as a matter of fact, equipped with excellent regulations, but it would almost appear that the American principle has been adopted of having excellent regulations on paper but forgetting their application. It is of course one of the common features of all modern American cities to have most model local by-laws on fire-preventive questions, but it is equally

THE SITE OF THE COLSTON AVENUE FIRE, BRISTOL.

certain, speaking generally, that with quite few exceptions these regulations are to a very great extent merely ornamental, i.e., they are not properly applied.

Bristol has the great merit of already having suitable regulations since 1840 and 1847, which are published in the "By-laws relating to Streets and Buildings for the City of Bristol," issued in 1903. It is in fact quite remarkable that such excellent regulations already existed as far back as 1840 and 1847, and this makes it more remarkable that they were not acted upon.

In section 25 (1840) it is quite plainly stated "that all openings in party-walls must be provided with iron doors and frames surrounded with stone-door cases into which the iron frames are inserted"; in section 24 (1847), "Every wall between separate buildings is a party-wall"; in another, "Every party-wall is to be of the thickness required for the largest building."

Again in another it is required "that where a building is divided into two or more separate buildings, proper party-walls are to be erected between the several parts." This presents a retrospective clause. In another section "separate buildings are such as are in separate occupation and have separate entrances and separate staircases."

There cannot be the slightest doubt about it that the buildings affected by fire should have had thorough separation by well-built party-walls. If Bristol had a Fire Inquest Act such as we have in the area of the Corporation of the City of London it should have been most valuable for showing where the fault lies. In a matter of this kind we cannot imagine that the fault is merely that of apathy; the Bristol fire hazards are surely too great for that with its growing business.

We give a plan of the second Bristol fire, in which the buildings showed an absence of proper separation as required by existing regulations. This plan and the one published in the previous supplement are valuable evidence of how regulations are at times neglected.

LONDON FIRE INQUESTS.

THE utility of the Fire Inquests Act for the area of the City of London has been recently frequently proved by the inquests held under the presidency of Dr. Waldo; and although the findings of the juries impannelled for enquiries of this description are sometimes a little curious, there cannot be the slightest doubt that the general tendency of the inquests is most valuable in calling attention to public dangers and strengthening the hands of those who wish to find a remedy.

We are recording in short the result of an enquiry into a petroleum fire on a city thoroughfare which raised a very difficult problem, namely, the protection of the basement of buildings having areas or gratings through which running spirit may set light to the contents. The state of the law on this question of petroleum cartage in London is certainly still very unsatisfactory, and requires remedy whilst such powers as already exist should be better applied.

As to the other fire, which the jury put down to an electrical cause, we think that it might be more judicious for juries not to jump too easily to conclusions as to crediting electricity with the cause of fires when there are other possibilities as to the cause forthcoming. The general trend at the present moment is to attribute too many of the unknown causes of fire to electrical errors or accidents. Whilst, of course, electrical wiring opens up innumerable sources of danger, more particularly if faultily done, it should always be remembered that, speaking generally, it takes very bad wiring to cause fire, assuming there is no special cause, such as the malicious tampering or ignorant handling of the wires or the application of an unexpected amount of power.

The reports on these inquests as presented to the London County Council read as follows:—

The Cornhill Fire.

"We desire to draw attention to a fire which occurred in Cornhill shortly after six o'clock on the evening of 16th October, 1905, on a steam motor wagon carrying cans of petrol. It appears that there were about 900 two-gallon cans, of which from ninety to hundred were full or nearly full. The remainder were returned empties, but there may have been some petrol in them. The flames rose to a height of from 20ft. to 25ft. above the level of the roadway, and the buildings on one side of the street were slightly damaged. If the fire had occurred in a narrow thoroughfare the buildings on either side would without doubt have become involved, and possibly a large fire might have resulted.

"An inquest into the cause of the fire was held on 27th October, 1905, by the City Coroner under the City of London Fire Inquests Acts, 1880 and 1885, when the jury returned a verdict to the effect that they were of opinion that the fire was caused by spirit leaking from a can or cans contained in the wagon coming in contact with an improper lamp. The jury added a rider to the effect that they considered that the carriage of petroleum through the streets should be regulated by the Petroleum Acts, or that an amendment of the law should be sought for the purpose.

"We have informed the Public Control Committee of the circumstances, and have

asked them to consider whether regulations could not be made to govern the conveyance of highly inflammable liquids such as petrol, and to provide that the vessels and vehicles in which such liquids are carried shall be suitable for the purpose."

The 49, Queen Victoria Street Fire.

"On 10th November, 1905, an inquest was held under the City of London Fire Inquests Act, 1888, by the City Coroner into the cause of a fire which occurred at No. 49, Queen Victoria Street, E.C., on 5th November, 1905, when the jury returned a verdict to the effect that the fire broke out in the basement of the building and was probably caused by a defective electric circuit. The jury expressed the opinion that the means of escape in case of fire were totally inadequate, and they recommended that the following improvements should be made, viz.:—(1) That all electrical wires throughout the building should be encased in metal tubing; (2) that the lift should be encased in fire-resisting material; (3) that a strong iron railing should be placed outside the building along the parapet; (4) that iron escape ladders should be fixed; and (5) that an additional staircase should be provided to serve the other end of the building.

FIRE TESTS.

CONCRETE AGGREGATES TEST.

WE have already referred to the important concrete aggregates test undertaken by the British Fire Prevention Committee in October, and we now have the official report before us. This report adds considerable information to what we have already indicated informally, and we give herewith full particulars as to the aggregates used and a summary of the results in each case.

The test, as already reported, was a three-hour one, followed by the application of water, the temperature exceeding 1,800 degs. Fahr. According to a prefatory note by Mr. Max Clarke, F.R.I.B.A., the test indicates, in short, that Thames ballast concrete is quite unreliable for ordinary floor work that is intended to be fire-resisting.

It is to be hoped that these tests will be continued at the earliest opportunity, as they have not yet gone far enough, but naturally the programme of tests with work in common use is a question of money, for such investigations are as expensive as they are time-taking. Had it not been for the co-operation of the Associated Portland Cement Manufacturers, Ltd., even the tests as far as they have gone would have been impossible to arrange.

The Bays.

The seven bays or slabs of concrete (10ft. by 2ft. 7ins. in the clear) were 4½ins. thick, and were quite separate.

The Cement.

The cement used was Portland, supplied by the Associated Portland Cement Manufacturers (1900), Ltd., London, and described by them as "Ferrocrete," used as a trade name for this particular brand of cement.

The particulars supplied by the makers contain the following statement:—

(a) Very fine grinding—residue on sieve with 32,400 meshes per sq. in. not exceeding 14 per cent.

(b) Great and progressive tensile strength averaging on the inch section:—

	7 days.	28 days.
Neat cement test	550 lbs.	750 lbs.
Sand test	200 "	350 "
1 (3 sand to 1 cement.)		

(c) Maximum of expansion—not exceeding 2 m.m. under the Chatelier test.

Preparation of the Aggregates.

In each case the aggregate was turned both in its dry and wet condition, and the concrete to form each slab laid on the centering in a rather wet state. 1½ gallons of water were used for each cub. ft. of concrete, approximately 20 per cent. of water by volume.

Summary and Results.

In the following description the aggregates are given to 1 part by volume of the above cement in each case:—

(1) FURNACE SLAG CONCRETE. Bay No. 1. Blast-furnace slag from the Islip Ironworks, Thrapston, Northampton, broken to pass a 1½in. ring, 3 parts. Clean pit sand from Kent, 2 parts.

RESULT.—Top: Slab cracked across in two places. Underside: Curved downwards ¼in.; slight cracks visible.

(2) BROKEN BRICK CONCRETE. Bay No. 2. Broken brick to pass a 1½in. ring, 3 parts. Clean pit sand from Kent, 2 parts.

RESULT.—Top: Slab cracked across in three places; slight curve downwards. Underside: Curved downwards ¼in.; slight cracks visible.

(3) BROKEN GRANITE CONCRETE. Bay No. 3. Broken granite, ¾in. (Guernsey granite chips), 3 parts. Clean pit sand from Kent, 2 parts.

RESULT.—Top: Slab cracked across in three places; curved downwards about ½in. Underside: Curved downwards ½in.; no cracks visible; about 1in. washed off by water.

(4) BURNT BALLAST CONCRETE. Bay No. 4. Burnt ballast, viz., clay from the neighbourhood of Child's Hill, burnt with slack coal, broken to pass a 1½in. ring, 5 parts.

RESULT.—Top: No cracks; not curved downwards. Underside: Not curved downwards; no cracks visible; about 3ins. washed off underside (in parts) by water.

(5) COKE-BREEZE CONCRETE. Bay No. 5. Coke breeze broken to pass a 1½in. ring (free

from fine dust), from the retorts of a London gas company, 5 parts.

RESULT.—Top: No cracks; not curved downwards. Underside: Not curved; no cracks visible; about 1in. washed off underside (in parts) by water.

(6) CLINKER CONCRETE. Bay No. 6. Furnace clinker, viz., the raking from the furnaces of large boilers, broken as last, 3 parts. Clean pit sand from Kent, 2 parts.

RESULT.—Top: Slab cracked across in two places; curved downwards about ¾in. Underside: Not curved; one slight crack visible; pitted in places about 1in. deep by water.

(7) THAMES BALLAST CONCRETE. Bay No. 7. Thames ballast dredged from the River Thames to pass a 1½in. ring, 3 parts. Clean pit sand from Kent, 2 parts.

RESULT.—Top: Slab cracked across in very many places; curved downwards about 2ins. Underside: Curved downwards 1½in., and bad cracks all over in all directions, mainly longitudinally; much washed off by water.

IMPENDING FIRE TESTS.

It is announced that in continuation of the series of fire tests which are being conducted with concrete and reinforced concrete as applied to building construction, three further investigations are to take place having special bearing on the question of aggregates. These will be—(a) with a floor of clinker concrete supported by broad flange beams, the reinforcing joists being fitted without the use of cleats, rivets or bolts, and the soffit of the beams being protected by coke-breeze concrete on expanded metal lathing; (b) with a floor of broken brick concrete reinforced with expanded metal, and supported by ordinary steel joists encased with a similar concrete on expanded metal lathing; (c) with a floor of clinker concrete reinforced by rods (on the Coignet

THE THAMES BALLAST CONCRETE BAY (NO. 7) AFTER TEST (SEEN FROM BELOW).

THE MUNICH CENTRAL FIRE-STATION.

system) and supported by reinforced clinker-concrete beams.

The tests will be in 22ft. testing chambers, each floor being divided into three bays, and in each case British "Ferrocete" cement will be used. The conditions of the test will be those for the standard of "full protection" (Class B.), which necessitates a fire test of four hours, increasing to over 1,800 degs. Fahr., followed directly by five minutes of water from a steam fire-engine, the floors being loaded $2\frac{1}{2}$ cwts per ft. super.

The first-named test is a repetition of one of August last, in which Thames ballast concrete with ordinary cement was used, with the result that some of the panels between the reinforcing joists collapsed. The third test, with the Coignet floor, is a repetition of the $2\frac{1}{2}$ hours test in which the standard of full protection (Class A.) has already been obtained, but with the additional protection of the rods as required by the new fire-insurance rules for reinforced-concrete systems.

Fires on District Railway.—On the evening of November 26th the brigade was called to the West Brompton station of the District Railway, where the underside of an electric railway carriage was found to be alight. The fire was mainly extinguished by means of sand, water being also used after the electric current was cut off.

THE NEW MUNICH CENTRAL FIRE-STATION.

THE new Munich Central Fire-station, which serves as headquarters for both the professional and the volunteer fire service of that city, is a conspicuous building in one of the best thoroughfares of Munich. The building also contains offices for the fire-survey departments of that city, inasmuch as the whole fire-preventive and fire-extinguishing service are under the charge of the chief surveyor of Munich, who thus really has two departments under him, namely, that of fire-inspection work and that of the fire brigade proper. The station is extremely roomy, and is, as a matter of fact, of a much more elaborate and expensive character than is customary with the headquarters stations of the most prosperous of cities.

In illustrating this fire-station it is perhaps of interest to give a few particulars as to the fire-preventive control in Munich. The principles adopted are as follows:—

Plans for all buildings in Munich have to be approved by this department. The building owner may appeal to the Bavarian Home Office if he has a grievance, and finally he may also appeal to the Minister of Interior in person if not fully satisfied. The principal officers of the fire brigade have to pass qualifying examinations in building construction and act as fire surveyors.

There is an elaborate code of building regulations in Munich, but many of these regulations only lay down guiding principles, leaving the officials considerable discretionary powers. The Munich regulations allow the officials of the building control and fire-survey departments to enter any building at will, and make requisitions for further safety from fire both from the building point of view and that of their general management, against which requisitions there is a power of appeal as described above. Chimneys are compelled to be swept periodically by public chimney sweeps at a tariff charge, and the chimney sweep is held responsible if a chimney in his district remains unswept. An inquest is held on fires if thought necessary, irrespective as to whether there has been loss of life or not. Dangerous structures are dealt with promptly by a trap fitted with appliances and materials being always ready for horsing and despatch from the station like an ordinary fire-brigade appliance (see "Fire Supplement" No. 1).

A SEASONABLE HINT.

ARCHITECTS who are in the constant employ of large works and the owners and managers of large industrial undertakings would do well at this season to remember that however excellent the fire installation may be with which the buildings in which they are interested are equipped there is a liability for the water-supply to freeze, and the absence of water in the early stages of fire may mean the entire gutting of the premises involved. We therefore publish the following extract from a circular issued by one of the American mutual insurance corporations who have the interest of both their corporation and the insured at heart:—

- (a) Examine tanks and all pipes, fittings and valves, whether for steam heating, general water service or fire-protection. See that none are frozen or have been frozen, and that they are all in operative condition, and where there is any liability of freezing arrange the necessary protection.
- (b) See that all valves are open that should be open, and try water outlets to ascertain if all pipes are free and ready for service.
- (c) See that extra sprinklers are on hand in case of need to replace frozen or melted heads.
- (d) Be sure that your engineer is fully posted as to the purpose and intention of every valve and pipe.
- (e) Try your pumps and see that they are in proper working order.
- (f) Test all the hydrants, and see that they drain properly.
- (g) Instruct the night watchman thoroughly in the use of all fire apparatus and the operation of all valves.
- (h) We take this occasion to call your attention to the liability of freezing water in casks and pails in cold buildings, and suggest that you take measures of prevention, at the same time avoiding danger of water damage.

It will be observed that apart from the actual hints having special bearing on the effect of cold weather on fire apparatus, some of these hints are very useful in a general way.

HOMAN'S STEELED CONCRETE FIREPROOF FLOORS.

Constructional Steelwork of
all kinds.

ROOFS, BRIDGES, PIERS,
JOISTS AND GIRDERS.

ALSO

GRANITE PAVING,
ASPHALTE, &c.

ADVANTAGES OF THIS CONSTRUCTION.

- Cheapest form of Fireproof Construction extant.
- Less Steel than other Systems.
- Bays securely tied together.
- Less thrust on Walls.
- Spans to 30 ft. without main Girders.

THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

December 27, 1905. Vol. 22, No. 568.

6, Great New Street, Fetter Lane, E.C.

*To our readers at home and abroad—A
Happy and Prosperous New Year.*

Summary.

The second volume of the "Architects' Law Reports and Review" has just been published. All the important decisions affecting the profession during the year are fully dealt with and illustrated, while the London Building Acts (Amendment) Act is included, with some useful legal notes on the same. (Page 365.)

The January elections at the Royal Academy will be in many ways the most interesting that have taken place for many years. (Page 365.)

A notable new school has been erected at Small Heath, Birmingham, to the designs of Messrs. Buckland & Farmer. The exterior is the expression of the interior arrangement, and is unusual by reason of the construction of barrel roofs in breeze-concrete covered with asphalt (thus reducing the cost of maintenance to a minimum) and the provision of central halls with side lights instead of roof lights, so as to improve the internal appearance of the halls. (Page 366.)

To ascertain approximately the artificial lighting required in factory buildings, divide the area of the floor by 70 and multiply by 20, which equals the number of sperm candles (six to the lb., and burning 120 grains to the hour). (Page 362.)

In dealing with the architectural development of cities in a paper read before the Leeds Philosophical Society, Prof. Beresford Pite said there were a few instances at home that would repay attention like those at Liverpool around St. George's Hall, and at Cardiff, in the Bute Park, where the new municipal buildings, law courts, university and museum were being grouped on a grand scale in harmony with the picturesque adjoining castle. (Page 366.)

"Architecture and Journalism."

There is a good deal to interest the general reader in the pamphlet with this title which has just been issued from these offices. It gives a very interesting account of the inception, development and character of our four journals—THE BUILDERS' JOURNAL, THE ARCHITECTURAL REVIEW, SPECIFICATION and THE MUNICIPAL ENGINEERS' SPECIFICATION—and is illustrated by many photographs showing the premises, the type-setting and machine rooms, the publishing office and the blockmaking studios. We shall be pleased to send copies to any readers who care to apply.

Co-operative Heating, Hot- Water and Gas.

MANY aspects of the cheap cottage problem have been dealt with, but there is one suggestion we have not seen put forward—one which could effect not only some economy but give additional convenience and comfort to the working classes. This is in the provision of heat, hot-water and light from some common centre. This principle of co-operative supply has already been carried out in regard to water and drainage in connection with many country cottages where large estate proprietors own the entire property, a condition which is to be found in very many cases. The only instance of the supply of hot-water in this way that we have heard of in this country is at Kells, near Whitehaven, where the Earl of Lonsdale is erecting a group of thirty-two miners' cottages. Hot-water for domestic and bathing purposes will be supplied to all the houses from one boiler; and as the ordinary Cumberland cottage is unprovided with a hot-water boiler, the arrangement will doubtless be most welcome to the occupants. It is apparent, moreover, that economy of fuel is thus achieved. Considering how inefficient the ordinary open fire is for heating purposes, we think the system might be extended to provide hot-water radiators. It could easily be arranged for these to be turned off if not desired by the inhabitants without affecting the supply of hot water for domestic use. As regards bedrooms, small coils could be provided so that the rooms could be warmed in winter. The importance of this, from a health point of view, is obvious. A range would of course be necessary for cooking purposes, but this might be a gas-stove. Of recent years the small power-gas producers have come into favour for gas-engines, and although these are principally used for pumping water, wood sawing and other estate purposes, there is no reason why they could not be utilized to provide a gas-supply for lighting and cooking for a group of labourers' cottages. If the gas were charged for according to the quantity registered by meter, waste could be avoided; and there seems no reason why a small charge for hot water could not be made also on a meter record of the quantity used. There are also many circumstances where this system might be adopted in towns, such as improvement areas under municipal authorities and large blocks of workmen's dwellings.

The Quantity Surveyor's Function.

In a paper read before a recent meeting of the Quantity Surveyors' Association Mr. F. B. Hollis defined the quantity surveyor as a man having expert knowledge (1) of building construction in all its varied phases; (2) of the mode of measurements customary in trades, together with the value; (3) of building by-laws and regulations; (4) of architecture sufficient to enable him to describe the details accurately; (5) of sanitary regulations, laws of dilapidations, arbitrations, compensation, rights of light and air, and mortgage, &c.; and (6) possessing a comprehensive grasp of the nature of the work to be done, which should enable him to place before the builder bills of the exact quantities of all materials and labour required. We think this list is a fairly accurate one, comprising what various quantity surveyors have been called upon to do, and it shows the usefulness of this class of specialist. Architectural work is nowadays so various and so complicated that specialism is necessary, and we must not be surprised if still further classes arise. Mr. Hollis went on to deal with such questions as whether the bill of quantities should form part of the contract, as to whether the quantity surveyor should write specifications for architects, and the conditions of contract, points which, although the quantity surveyor has to deal with and upon which he is often called upon to give a decision, yet are somewhat outside his province as a specialist. Mr. Hollis drew attention to the fact that owners do not favour the system of estimating at present adopted in the building trades, because they cannot ascertain from the start exactly how much the job is likely to cost. This undoubtedly is a defect, and in the United States, where builders take off the quantities themselves from much more completely finished drawings, a lump sum can be given with some reasonable likelihood of its being exact. This inaccuracy of any estimate is one of the great causes of dissension, and it is a pity that some solution cannot be arrived at, although the system of including the quantities as part of the contract may satisfy the builder if it does not satisfy the client. However reasonable it may seem, it probably will not suffice. We have already stated that we think the architect ought to control the specification as a necessary part of the design, yet a busy man can no doubt delegate some of his duties to a quantity surveyor.

FACTORY BUILDINGS.

Their Planning and Construction.

By A. ALBAN H. SCOTT, F.I.S.E., M.S.A.

(Concluded from p. 350, No. 567.)

Power-house.

THE power-house should be close to the boiler-house, with easy access between the two. The lighting and power switch-boards should be kept separate, and both placed on a gallery at the end of the power-house.

Electric travelling or hand cranes should be arranged for, so as to permit the removal of any heavy machinery without the necessity of erecting derricks, which is a very costly item; also, provision should be made for any machinery proposed to be fixed to allow the free outlet of same without unnecessarily cutting the building about. This could be arranged for at the gable end by either having large sliding doors to be opened in case of necessity, or by building up thin brickwork with straight joints so that it could be taken down and rebuilt without injuring the other portion of the building.

The shafting being hung on to or suspended from the main stanchions or girders, it is of the utmost importance that good foundations should be given to the principal points of bearings. If the shafting once gets out of alignment through unequal settlement in the building, it is an everlasting trouble to remedy this.

Chimney Shafts.

Steel chimneys have been used a great deal in recent times, probably because of the short time required for their erection, but they are very little cheaper than brick chimneys, and the cost of annual maintenance is so great that it outweighs any other advantages they seem to offer. Round chimney shafts are more economical and of a smaller area than square ones, and the effect of the wind upon them is much less. Tall chimneys should not be connected to any other building, owing to the increased settlement due to their height. The size and height of a chimney entirely depends upon the work it is required to perform.

Construction of Walls and Partitions.

The walls and partitions can be constructed of brickwork, concrete, Uralite or corrugated iron, or they may consist chiefly of glazing, or a combination of any of these materials to suit the circumstances of each case. The internal facing of brickwork should have flat joints, so that if it is whitewashed or painted the wall presents a fairly even surface without unnecessary small ledges for the retention of dust. All brickwork should be built in old English bond. Brick piers carrying heavy loads or subjected to vibration should be constructed in cement-mortar. All arches, abutments, oversailing courses, half-brick partitions, trimmer arches and parapets should also be in cement. It is usual to allow 1 in. to every 30 ft. in height of brick walls or piers for settlement of the mortar joints; this is important where a girder gets its bearing at one end on brickwork and rests at the other end on a steel stanchion. Where large masses of walling or gable ends are being constructed on a site exposed to powerful winds they should be carefully shored. A case came under my notice some months ago where a new wall in an exposed situation was shored only on the windward side, which resulted in the wall being gradually levered over by the shore itself, as after every gust of wind the wall was prevented from regaining the perpendicular by the shore taking a new bearing as the wall gave to each gust of wind. All salient angles of brickwork should be of bull-nosed blue bricks for a height of 7 ft. Hoop-iron bond may be found very serviceable if used judiciously.

Wire screens should be used for separating portions of shops for any special kind of work

and for stores. These are far preferable to solid partitions, as they give freer circulation of air and solve to a great extent the question of light. Fixing bricks should be provided for the purpose of fixing joinery work, and no wood should be built into the walls. All lintels should be formed of reinforced concrete.

For the damp-proof course, asphalt is the best for vertical work, but for horizontal work the best form is vitrified stoneware slabs. No artificial asphalt should be used for horizontal work. The best mineral asphalt only should be used.

Glass.

Generally, no glass should be less than $\frac{1}{4}$ in. thick, the rough-cast glass being the best owing to it being more easily cleaned than ribbed glass. The roof lights should be wire-weave glass, to prevent the danger of broken glass falling. This wire-weave glass has special fire-resisting qualities, and should be used in all places where light is required which might form connecting points for the spread of fire, such as in panels of doors to staircases and lift enclosures. In Glasgow and other northern cities about one-half the area of walls and roofs is composed of glass, whereas in the south only about half this quantity is generally used. The lower panes of glass should not be totally obscured, as this is very depressing for the employees. Rough-cast glass is sufficiently obscured, and yet from the inside you can just see objects outside, which relieves the monotony. When galleries are used the roofing lights will require to be near the ridge of the roof, so that ample light will be thrown down the well-hole. Where there are no galleries the roofing light is more effective if placed midway between the ridge and eaves.

Window Frames.

Window frames should be of steel, and the panes should be kept of small size, so that in case of breakage the cost is small to replace. The opening portions should be opened by gearing with detachable key; no lines and cords or pulleys should ever be used. The detached key should be in the keeping of the person in charge of the shop.

The internal sill of windows should not be left flat, but sloped off to prevent a large accumulation of dust, &c., and externally to prevent accumulation of snow and wet.

Joinery.

All joinery used should be of the best description, both as to material and workmanship. Very strong and hard wood should be used for doors, window frames, enclosures, &c.; in the case of large doors they should be well held together by iron bands at all angles, and at their weakest joints. The locks and ironmongery generally should be of the simplest possible description, with stout and strong fastenings; and, generally speaking, no cast-iron should be used for door or window furniture. In the case of sliding doors flush drop-handles should be used.

Sliding Doors.

Sliding doors should invariably be used (swing doors are always a trouble); they should be hung at the top with anti-friction runners, the running bar being in one piece and stout, so that there is no risk of deflection. The guide-rail should be at the bottom with a narrow opening, formed of two angle-irons, properly spaced apart with distance-pieces and bolts. These should be bedded firmly in concrete and finished flush with the floor line. In the case of external doors, the top runners and bars should be protected from the weather by a small projection over same.

The doors may be formed of corrugated iron on a steel framing of angle bars, or of wood; the latter are generally more satisfactory. Very excellent doors are those formed of two, three or four thicknesses of wood and Uralite, and faced with polished

tin plates. They are eminently satisfactory, especially as internal doors, being automatically shut after a certain temperature is acquired; they are also fire-resisting.

Floors.

Floors (except ground floors) should be either constructed of wood flooring in the ordinary way or be fire-resisting floors, of which there are very many varieties. This matter, however, is dealt with under the heading of "Reinforced Concrete." Great care should be taken in using precautions to prevent any chance of floors, whilst under excessive heat, expanding and pushing out the enclosing walls. This also might be caused by using bad cement. The simplest and best method of avoiding this disaster is to insert fillets of wood around the concrete flooring next the walls whilst it is being laid, and afterwards, when the concrete has partly set, to remove these. The necessity of attending to such points as these will probably be better realized when I state that a short time ago a concrete floor forced the side walls of a building out of the upright to the extent of 5 ins. merely by expansion under heat.

Flooring.

Various flooring is used, according to the nature of work to be carried on. If wood is required, maple will be found inexpensive and of excellent wear, provided the wood is in narrow widths and well secured. Good deal, with the surface as left from the saw, is also extensively used, as well as wood blocks like those used for street paving. Maple should not be less than $\frac{1}{4}$ ins. thick, deals not less than $\frac{1}{4}$ ins. thick, and wood blocks 3 ins. If in wood flooring the battens are embedded in the concrete they should be of dovetail shape and well tarred, as also should be the underside of the boards. It will sometimes be found necessary to put a damp-proof course of asphalt under the whole floor. This additional expense should not be incurred unless absolutely necessary, and can be obviated in many cases by putting about 9 ins. of hard bricks broken, well rammed under the concrete. There are many pavings which can be laid *in situ* or in slabs. Generally that laid *in situ* is better, owing to the liability when the slabs are not properly bedded to crack in case of heavy weights.

Where stone or other paving of cold nature is used the employees are generally provided with standing boards, formed of battens, similar to ordinary snow boards. Unless these are made in a particular form they may be dangerous for use close to machinery or tanks, as they are liable to slip on a greasy floor. In certain factories the flooring is made of slabs of checkered iron plates similar to the gangways of an engine-house. I think these must prove dangerous. There is a patent flooring which is made up of cement and sawdust. It is clean, warm, tough and non-slipping.

Roofs

should be constructed of wood or steel, or a combination of these two materials. It is not usually found successful to use anything but steel for roof-work, owing to the fact of the shrinkage of wood; moreover steelwork is very much lighter and does not obstruct the light to any great extent, so that no heavy shadows are cast upon the machinery or plant; and there is also an economy in maintenance. The covering to pitched roofs can be formed of a variety of materials, such as tiles, slates, Uralite, corrugated galvanized iron, glazing, &c. Tiles and slates are expensive; Uralite requires constant painting; corrugated galvanized iron should be coated with a wash of Portland-cement grout, and the glazed portions should be formed of glass glazed into patent steel bars with drawn lead covering, thus getting over the objection of using putty. The corrugated galvanized iron

sometimes causes a certain amount of condensation; this is avoided by lining the underside of the roof with Uralite or Compo-boards, and painting. No wood rafters should be used for any coverings to factory buildings; steel laths can be used without a great additional expense. Provision should be made for clips and bearers to support snow boards, &c., and to enable the roof glazing to be cleaned down. The pitch of the roof also requires to be carefully worked out, or the result will be unsatisfactory.

Plaster

should never be used in the actual factories and workshops. It is a continual source of trouble and expense for repairs, and never satisfactory. If it is necessary to have a smoother surface, then either Uralite sheeting or Compo-boards should be used, both of which can be fixed to almost any materials; they are also fire-resisting, and can be painted or coloured; the cost of fixing is very small, and the work can be executed very quickly.

Paintwork.

With reference to the general paintwork, we must be content to regard this as merely a means of protecting the materials, and not as a form of decoration, but there is no reason why a cheerful scheme of colouring should not be adopted. It costs no more, and has an appreciable effect on the spirits of the workpeople. The scheme of colouring should be uniform throughout, which is possibly less expensive than patched work, with different colours and shades for every building, and far more satisfactory. For internal work everything above the level of 6ft. above floor line should be white; below this point a fairly dark red colour is found to be very effective and serviceable. The external work can be best treated with a combination of two colours, such as dark green for all doors and a lighter green for window frames and other ironwork.

Drainage.

Under the Public Health Act every building used as a workshop or manufactory must be provided with suitable and sufficient accommodation in the way of sanitary conveniences, having regard to the number of persons employed and with separate accommodation for persons of each sex, and it is for the surveyor to see that this is complied with. All rainwater drains should run into collecting tanks fitted with an efficient filter. The water can then be utilized for the purposes of supplying the works. The yard gully and soil drains should be connected to the main sewer, or, where this is not available, into a cesspool placed at a good distance from the factory. A small installation of septic tanks may be provided on a suitable site where it is possible to discharge the effluent. The gulleys should all have movable locked covers or grids with proper curbs around them. Where rainwater is to be collected, gulleys should not be used.

In certain factories it is necessary to run the drains from the yard gulleys, &c., into a tank to collect oil and other material for re-use, thus doing away with any waste, and if this were not done trouble would probably arise with the sewer authorities for allowing trade refuse to discharge into the sewers. All eaves gutters should be of galvanized wrought-iron secured to galvanized brackets, and so fixed as to prevent tilting when ladders are placed against them. Cast-iron down-pipes should never be used; they should be of galvanized iron, and these should be fixed by brackets so that the rainwater pipe is at least 2ins. away from the building.

Ventilation.

The cubical capacity can be considerably increased in a steel building at a very small additional cost, a building 18ft. high being only a trifle more expensive than a building 12ft. high. This will be a great help towards the avoidance of excessive heat in summer

when corrugated iron roofs are used; whereas the extra cost incurred in increasing the cubical contents of a brick building is a very serious item. Fresh-air inlets can be provided at any points desired, and the outlets can be arranged to suit the special requirements of each building. Continuous louvres can be used at the apex of the roof, or individual louvres may be placed at certain points; these should be fitted with shutters to open and close with a very simple apparatus.

Men at work vitiate much more air than men at rest. 55 cub. ft. of air per head per minute is required for good ventilation. An additional amount should be allowed for all gas jets, &c. Where either heat or loose steam accumulates, special ventilators have been designed to suit special cases. Care should be taken that the large amount of glazing on the roof does not cause a draught. All louvres and ventilators should be so designed as to prevent any rain from being driven into the building. In such buildings as cotton, wool, flour or other similar mills, special arrangements need to be made. Also in certain shops small open fires are used, and in this case arrangements have to be made to collect the smoke in special flues to obviate the expense and the nuisance of the large number of small chimneys. Louvres should be arranged to throw coal dust, flour, &c., away from gutters, as otherwise these will speedily become choked.

Lighting and Heating.

I cannot do more than just touch upon the question of artificial lighting and heating. To ascertain approximately the lighting required, divide the area of the floor by 70 and multiply by 20, which equals the number of sperm candles (six to the lb., and burning 120 grains to the hour). The following are a few of the methods adopted for lighting:—Electric light (various methods). Coal gas—Incandescent, acetylene. Oil—Kitson's and other methods.

The light should be thrown downwards on to the work, and protection for the eyes provided as much as possible.

Heating can be effected in many ways, namely, radiators—electric and hot water (high- and low-pressure); steam (high- and low-pressure); hot air; and gas. Dowson's gas is also sometimes used for heating, &c. The temperature found most suitable is 50 degs. to 55 degs. Fahr., but in special cases, such as cotton and wool mills, a greater heat is required. It entirely depends upon the nature of the work carried on as to which system should be adopted. The large pipes required in the low-pressure hot-water system are a great disadvantage, taking up a large floor area unless they are in a trench, which again is open to objection.

Lightning Conductors.

These should not be fixed haphazard, but a proper scheme should be formulated for the whole of the works. The tall chimney should have a copper band around the top, and stout copper points, each about 1ft. long, at intervals of about 30ins. around the circumference, and the rod should be connected with all bands and other metal in or near the chimney. Oxidation of the joints must be carefully guarded against. The rod should be attached to the building by metal clips, and not insulated; these clips should not be so tightly fixed as to pinch the rod, or to prevent contraction and expansion. The lower extremity of the conductor must be buried in permanently damp soil, and the tape soldered to a sheet of copper having an area of about 10ft., this sheet being not less than $\frac{1}{16}$ in. thick.

Reinforced Concrete.

For reinforced concrete construction there are at present about fifty different systems, most of which are patented in some detail of construction, the principle in all systems

being similar. The by-laws of the United Kingdom will not allow economic building with reinforced concrete, but on the Continent matters are quite different, and in many cases special by-laws have been framed to deal with reinforced concrete construction, while in other cases this is allowed to be carried out subject to the approval of the proper authorities. The necessity of the English local authorities framing by-laws acknowledging and governing the construction of reinforced concrete buildings is becoming every day more urgent.

The best materials only should be used. They should be well and carefully mixed and properly rammed. If the ramming is not properly carried out there is a chance of rust getting to the steel by the air percolating through the perforations in the concrete.

Iron rods bedded in concrete have been found submerged in water for 400 years without rust. The remarkable fact in this connection is that iron already rusty when embedded in concrete becomes perfectly clean, and when taken out will resist rust even more than clean iron.

The proportions of the ingredients for the cement practically follow the usual practice. The cement for the concrete should be Portland cement from well-burnt clinker; it should be finely ground, and 80 per cent. should pass through at least a 100-mesh. It should weigh from 100 lbs. to 120 lbs. per struck bushel; that is, it should be both fine and heavy. It should be a grey or greenish-grey; other colours denote imperfections. Its tensile strength should be equal to 380 lbs. per sq. in. seven days after being made; there should be no appreciable swelling or shrinking. The best cement for the purpose, and one that answers to the above description, is that manufactured by the Associated Portland Manufacturers, Ltd., which they name, rather vaguely perhaps, "Ferrocrete." The advantages claimed for this cement are as follows:—The clinkers are hand-picked, which ensures well-burnt clinker only being used. This prevents excessive expansion. The cement is reduced to such fineness by grinding that only 14 per cent. remains after passing through a sieve with 32,000 meshes per sq. in. It is of great tensile strength, averaging from 550 lbs. to 750 lbs. per sq. in. for the neat cement, according to the period it remains after being made up. The concrete should consist of 3 of cement to 5 of river sand and 10 of ballast or broken brick or granite; that is a proportion of 1 to 5. Clinker should never be used, as it is impossible to govern its components; a certain amount of sulphur is always present, which may finally disintegrate or at least affect the setting of the concrete. The sand should be from the river, clean and sharp. The concrete should be mixed in small quantities on a raised platform, and watered gently and moderately, and turned over three times dry and three times wet. The reinforcement consists of round bars of steel varying in diameter from $\frac{1}{4}$ in. to 2ins. All wirework should be annealed.

The weight of reinforced concrete varies from 140 lbs. to 160 lbs. per ft. cube.

Strengths.

For the purposes of reinforced concrete work the following strengths of the various materials are generally accepted:—The ultimate resistance of concrete to crushing is 25 tons per sq. ft. Its ultimate tensile strength is about 5 tons, but this is rarely taken into consideration. The ultimate tensile strength of steel is taken at 30 tons per sq. in., the safe working load being one-fourth of this. The modulus of elasticity of mild steel is 30,000,000 lbs. per sq. in., and its elastic limit is reached at 8 tons to the sq. in. The steel should be of a mild quality, so that the bars can be twisted to any shape without cracking, and should bend whilst cold to an angle of 180 degs. Another

great advantage of reinforced concrete is that it fails slowly, and gives pronounced warning of being over stressed before failing. Failure does not occur until the elastic limit has been passed; reinforced concrete beams have more of the characteristic of steel than of ordinary concrete beams. They deflect and recover. If highly elastic steel is used it should be bonded to the concrete. The strength varies as the strength of the bars; about 10 per cent. metal is a good proportion; this equals in weight 120 lbs. per cubic yd. of concrete. A special test made in Calais showed that after a reinforced concrete beam of arched shape was stressed till it cracked, 86 per cent. more weight was put upon it before it broke. Brickwork will fail with only 59 per cent. over the weight required to crack it. A beam was tested with eight and a half times its calculated breaking weight before it cracked in the centre. Since that time, six and a half years ago, the load has not been removed, and the beams show no further deflection and no increase in the size of the cracks.

That reinforced concrete can resist shocks and vibrations is instanced by the fact that piles are made with this material and give the very best results after being driven in the usual way, namely, by means of a falling weight. With regard to the effect of vibration, it may be stated that this is not of such importance as it would be in a steel construction, the reinforced concrete having been proved to vibrate only in a very small degree; this makes it invaluable for use in boiler and engine beds. Hollow walls, where desired, may be easily constructed, although I am not prepared to recommend the use of hollow walls in any material. Double floors, for greater security against fire, and to check the transmission of sound, &c., can also be economically and strongly built.

Advantages of Reinforced Concrete Construction.

The following are some of the points which go towards economy:—Ease and rapidity of erection; painting is not required; thicknesses of walls and floors are reduced everywhere; cost of maintenance, nil; cost is in nearly all cases less than the ordinary mode of building, and it can be said that as time goes on reinforced concrete increases in strength rather than deteriorates. With regard to painting, this may seem a small item, but to take an instance I may cite that the Forth Bridge, a steel structure, is always in the hands of the painters, which probably costs £600 to £1,000 annually. This would be avoided in the case of a reinforced concrete bridge.

Reinforced concrete is proof against boring animals and insects. I may instance that Baker Street Station, originally built of wood, when pulled down was found to be literally alive with fleas. Concrete is proof against marine worms, which have been known to destroy wood piles at the rate of 1 in. to 3 ins. per annum. There is a saving of more than 20 per cent. over steel in the cost of stanchions, and 15 to 25 per cent. in beams. Floors in reinforced concrete are lighter than ordinary fire-resisting floors. For piers, abutments, vaults, floors, walls, &c., reinforced concrete has about from three to five times less volume than ordinary concrete or brickwork, and therefore less weight. In retaining walls less thickness is necessary. The thinness of walls means increased air space and accommodation.

Foundation Rafts.

If building on soft ground we should endeavour to spread the weight of our building over a large area in order to get a good bearing. A reinforced concrete beam or slab can be constructed, say, 4 ft. wide, and this, owing to the reinforcement, need not be more than 4 ins. or 5 ins. thick. This slab in section is like an inverted T, the wall resting on the beam portion. The slab, being built up of interlaced steel bars, is practically monolithic,

and consequently very rigid, and owing to the small thickness very economical. Single slabs are used to spread the weight of piers or detached stanchions, and they are tied together in such a way that it is impossible for the column to get out of the perpendicular, however eccentrically it be loaded. The whole site in cases where the soil is liable to contain soft spots, such as marsh land, can be covered with a homogeneous slab, thus ensuring equal settlement. The weight of roof principals and floors can be concentrated on piers, which will allow the walls to be constructed only a few inches thick, and as they are tied into the piers they do not suffer from unequal settlement, as brick or stone walls built on the same principle would.

Flooring

can be made in several ways. First, thin slabs only 3 ins. or 4 ins. thick, supported by small beams or ribs spaced only a few feet apart, and resting on the main beams or walls. This method is used principally for mills, warehouses, and generally where the superloads are considerable or where the spans between the supports are unusually large. These small beams are not generally hidden by a ceiling; in certain cases, however, a ceiling is provided either in reinforced concrete or other material, and supported by the beams, leaving a space between them and the slab; secondly, thicker slabs can be made, 5 ins. to 6 ins. thick, with a reinforcement of principal bars, say, $\frac{1}{2}$ in. to $\frac{3}{4}$ in., running in the direction of the smallest span between supports and bearing; the secondary bars are about $\frac{1}{4}$ in. thick spaced every 4 ins. or 5 ins.; thirdly, when a floor without ribs is required, and when the span and load are both considerable, in order to diminish the thickness of concrete in compression a network is introduced in the upper part of the slab, the bars of which take the compressional stress. These two frameworks are connected by $\frac{1}{4}$ in. ties. This flooring is on the principle of a beam of great width compared to its depth. The principal and secondary bars are bound together by annealed wire $\frac{1}{8}$ in. diameter at every other intersection.

Beams.

For beams the reinforcement consists of two or more upper bars (compression) and two or more lower bars (tension) linked together by $\frac{1}{4}$ in. ties, and spaced every 4 ins. or 5 ins. The ties binding these upper and lower bars are bent with special tools, and each set can be placed into position ready for concreting. Beams can be prepared beforehand, and when dry can be hoisted into position, and by a special arrangement they can be made also to support the centering for the slabs. When beams are prepared beforehand, the ends of the ties are left free and are bent over the bars of the slab before concreting.

Post and Pillars

can be made round or square; longitudinal bars about $\frac{3}{4}$ in. to 1 in. being bound by $\frac{1}{4}$ in. spiral ties every 5 ins. Annealed wire is used at every intersection.

Piles

are made very much on the same principle as posts, except that sometimes the ties instead of being spiral are made of horizontal rings with ends bent in and around every two alternate longitudinal bars. These piles can be round with two flat sides for guiding, or square. The usual length is about 15 ft., but they are moulded horizontally, and made any length up to 60 ft. They are driven like wooden piles.

Walls,

which are generally only a few inches thick, are very good in cases where there is vibration—for instance, in mills, factories, engine-houses, &c. Reinforced concrete walls must be considered as partitions, and are only economical in cases where a brick wall would be very thick.

Keystones.

At Peterborough a Carnegie free library has been built at a cost of £6,500.

New Municipal Buildings at Bromley are proposed to be erected. Mr. F. G. Minter's tender of £18,793 has been provisionally accepted.

Mr. J. H. Langlands, who since 1886 has acted as architect to the Dundee School Board on an ad interim appointment, has been selected officially as the architect and measurer for the Board. Mr. T. Ogilvie has at the same time been appointed clerk of works.

Petition against Granite Sett Paving.—At a recent meeting of the Holborn Town Council a deputation from Lincoln's Inn Fields was received by the mayor and corporation in reference to paving the roadway with "silent material" in place of the noisy and unevenly laid granite setts. The petition, which was signed by nearly every firm in Lincoln's Inn Fields, was referred to the Streets Committee for consideration.

Garden City.—The number of houses occupied on the Garden City Estate is now about 150, representing a new population of more than 700 people. Of the new residents of 134 houses 19 are professional men, 14 contractors and master builders, 59 artisans, and 27 labourers. The Garden City Tenants, Ltd., have started a building scheme for the erection of 100 cottages on the estate. To meet the demands of the increasing population about £10,000 is being spent on extending the drainage scheme.

York Architectural Society.—At the recent annual dinner of this Society (Mr. Arthur Pollard, president, in the chair) Mr. Butler Wilson referred to the question of architects' registration. As a member of the Institute committee now considering the matter he said it was particularly pleasing to observe the assiduity with which provincial members followed in the business of the meetings, and he thought they must all be satisfied with the way in which the president of the Institute had taken the matter in hand.

Old East Riding Churches.—Mr. J. Shepherdson in a lecture before the Hull Literary Club on "The Village Churches of the East Riding" said that East Yorkshire, especially the Wold district, was particularly rich in specimens of Norman churches, and he described Wharrah-le-Street, Kirby Grindalythe, Thwing, Wetwang, Garton, Kirkburn, &c. Weaverthorpe was given as probably the most interesting specimen of a small Norman village church in the country. The church at Goodmanham was probably the oldest, and contained very early Norman work. Whilst in the Wold district the majority of the churches were undoubtedly of Norman origin, the Holderness churches were, generally speaking, of a later date.

Society of Engineers.—At the fifty-first annual general meeting, held recently, Mr. Maurice Wilson was elected president and Messrs. R. St. George Moore, J. W. Wilson and W. H. Holtum were elected vice-presidents. The president announced that the following premiums had been awarded by the Council for papers read during the past session:—The president's gold medal to Mr. Sherard Cowper-Coles for his paper on "The Metallic Preservation and Ornamentation of Iron and Steel Surfaces"; the Bessemer premium of books to Mr. E. R. Matthews for his paper on "The Parade Extension Works at Bridlington"; a Society's premium of books to Mr. B. L. Bradley for his paper on "The Grindleford Stone Quarries and their Working"; and a Society's premium of books to Mr. W. P. Digby for his paper on "Statistics of British and American Rolling Stock."

Views and Reviews.

The Architects' Law Reports.

The second volume of this admirable record of law cases affecting architects, surveyors, engineers, &c., is as complete as it is possible to make it, and will prove of inestimable value to all those interested in the law affecting buildings and streets. The compiler, Mr. Arthur Crow, F.R.I.B.A., assisted by Mr. A. F. Jenkin, barrister-at-law, as legal editor, has produced a bulky volume, but the report have been most judiciously selected, only the most important being inserted. These are all separately paged, and with their indices are complete in themselves. An improvement which will be welcomed is the insertion of some blank pages for press cuttings and memoranda. The recently-passed London Building Acts (Amendment) Act is included, with some useful legal notes on the same, and the cases are very fully reported and, where necessary, illustrated with plans and photographs, thus rendering the work of additional value. For the future the reports will proceed on the lines of a periodical legal review, in addition to the series of revised reports, and for the present it is proposed to issue it as important decisions arise. Developed on these lines, the publication is bound to become increasingly useful to the profession, and should be on the book-shelf of every architect.

"The Architects' Law Reports and Review," by Arthur Crow, F.R.I.B.A. London: 18, Prescott Street, E., price 10s. nett.

Competitions.

Old Kent Road Branch Library.—Plans are to be invited by the Southwark Borough Council for a branch library in the Old Kent Road. Premiums of £50, £30 and £20 will be offered.

Pavilion and Grand Stand, Darlington.—In a local competition among architects at Darlington Messrs. Kitching & Lee have been placed first for the proposed pavilion and grand stand for the Darlington Athletic and Cricket Club, to cost about £800. Ten sets of designs were submitted. Messrs. Kitching & Lee have been instructed to proceed with the building.

Cottages for Port Sunlight.—In the competition for cottages to be erected at Port Sunlight, instituted some time ago by Mr. Lever among members of the Liverpool Architectural Society, Messrs. Deacon & Horsburgh have been awarded the first place among architects in practice for the design of seven cottages (these to be carried out by them) and Mr. T. Taliesin Rees the second premium of £20; while Mr. Hazeby Adams gains first place among assistants for plans for five cottages (these to be carried out by him) and Mr. T. J. Miller Reid the second premium of £20.

Unsatisfactory Conditions.—The Competition Reform Society disapproves of the con-

ditions in the competition for a free library at Shaw because the limit of cost is insufficient and competitors are to state what part of their fee they will allow towards clerk of works' salary, &c. The society also warns its members that the conditions in the competition for the proposed school at Selby Oak for the King's Norton and Northfield U.D.C. are unsatisfactory, for the following reasons:—No premiums; the assessor will assist the promoters; no remuneration offered for the deferred portion of the school (two-thirds); limit of expenditure vague and the author of selected design must prepare working drawings and obtain tenders before his design is accepted (see last clause, p. 4); a perspective drawing is required; the site plan has to be verified by the competitor.

January's Elections at the Royal Academy will be in many ways the most interesting that have taken place for many years. There will be no fewer than seven elections. On January 8th two painter-sculptors or architect Associates will be elected in the place of Mr. David Murray and Mr. John MacAllan Swan, both of whom were raised to Academician's rank early in the present year. On the following evening three Royal Academicians—one English and two honorary foreign—will be elected. The English Academician's seat to be filled is that of the late Mr. H. H. Armstead, and probably this election will result in the return of another sculptor.

PLANNING UNDER DIFFICULTIES.

SETTLING ACCOUNTS.

POSSIBLE FUTURE REBUILDING OF PARK LANE, W.
(THE BATTLE OF THE STYLES)

OUR PLATES.

THE elevations of the new schools at Small Heath, Birmingham, are intended to be the outward expression of the general plan and arrangement. The rather unusual form is due chiefly to two things: (1) the construction of the roofs, which are all of breeze-concrete covered with asphalt; (2) the attempt to provide central halls with side lights instead of the rather too frequent roof lights. The reason for the first was a desire to reduce the cost of maintenance to a minimum, and for the second the improved internal appearance of the halls, and the possibility of a more architectural treatment. The materials employed in the external elevations are common bricks from Black

Country yards, with copings of Horseley Castle stone. Internally the walls are plastered and have dadoes of glazed bricks; floors of halls and classrooms being of pitch-pine blocks, and corridors and cloakrooms of granolithic. The heating and ventilation is on the "plenum" system, with low-pressure steam as a heating medium. Messrs. Buckland & Farmer, of Birmingham, are the architects.

The Coliseum Music Hall, which has been built in Eglinton Street, Glasgow, by the "Moss Empire" Syndicate, is claimed to be the largest theatre in the world. It was designed by Messrs. Frank Matcham & Co., of London. The auditorium, which is seated for 4,000 persons, has thirty-six exits.

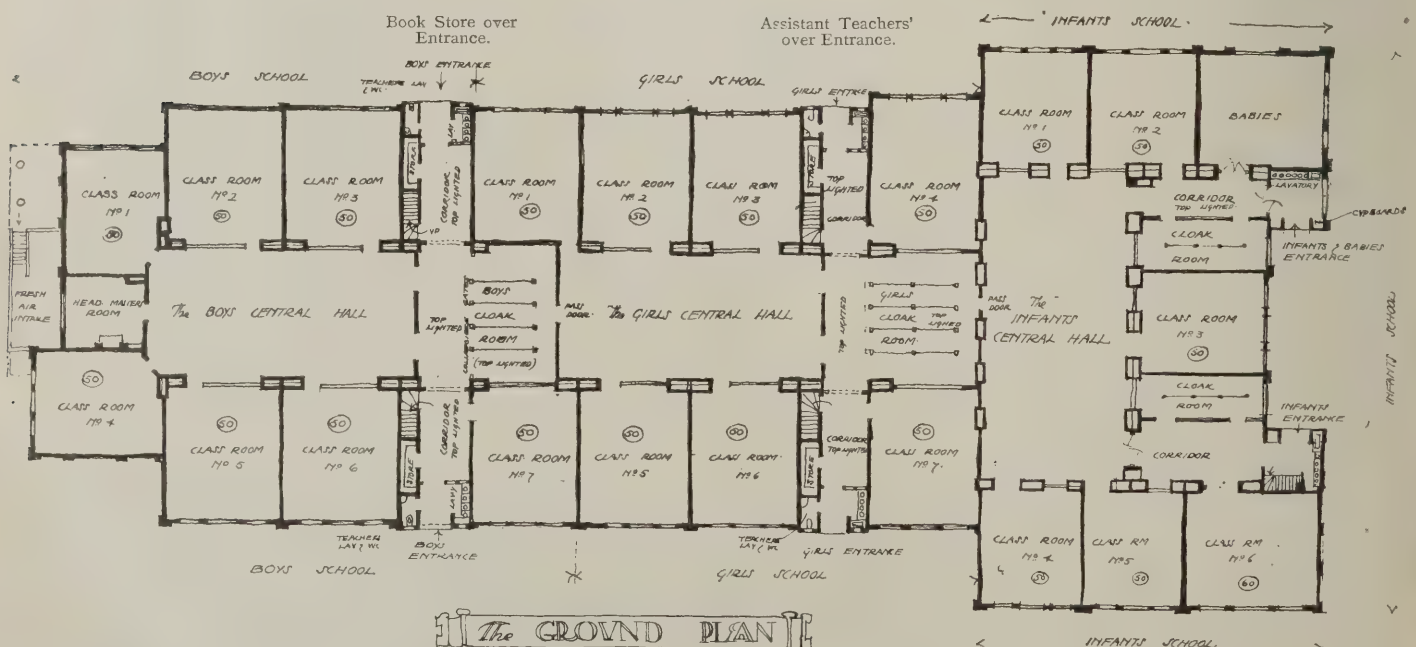

DEVELOPMENT OF CITIES.

PROF. BERESFORD PITE, F.R.I.B.A., delivered a lecture last week before the members of the Leeds Philosophical Society on "The Architectural Development of Cities." He said we had few instances at home that would repay attention like those at Liverpool, around St. George's Hall, and at Cardiff, in the Bute Park, where the new Municipal Buildings, Law Courts, University and Museum were being grouped on a grand scale in harmony with the picturesque adjoining castle. The new city plans would have to be sought abroad, on the Continent, or in America, or in our Colonial Empire. Probably Turin and Berlin were characteristic of the most modern schemes on the Continent. The special characteristics of the Continental cities just named, he said, were the extraordinary effects of aggregated public buildings, every one of which had a purpose and a meaning.

Referring to London he gave instances to show that each district or borough afforded opportunities for the local exercise of municipal patriotism, and he specially dwelt upon several of the most modern street improvements. The sweep of the curves of the river had afforded fine scope for the effective laying-out of London; and the Thames Embankment, to the beauty of which, he said, Englishmen were scarcely yet alive, came in for high praise. Along the river from Somerset House to Fulham the buildings punctuated the historical progress with architectural effect, which effect was not even excelled by the Champs Elysees. The laying-out of the Place de la Concorde and of the Tuilleries Gardens, however, was very instructive to all who had to lay-out public parks and gardens. The fine great school of architectural gardens seemed to have died out in England, and the art was lost so far as this country was concerned. The combining of trees with public buildings in the Champs Elysees and Unter den Linden had, in his opinion, a doubtful effect, for the trees interfered with the effect of the buildings.

VELOGRAPHY.

THERE are several well-known processes by which copies of plans can be obtained. These include lithography, photolithography and photography, but all who have seen the work turned out by Norton & Gregory, Ltd., of Castle Lane, Buckingham Gate, S.W., must admit that their process (technically known as Velography) cannot be approached for general excellence and the speed with which copies can be produced. The process is a secret one, but Messrs. Norton & Gregory recently demonstrated to a number of press representatives the wonderful rapidity of their method. This was the more remarkable because of the exactness of detail. In fact, it may be briefly stated that by this process an absolutely correct copy is secured, without any of the shrinkage and distortion usually associated with photographic processes. This is obviously of the greatest importance. Velography, in short, has all the good points of the older methods with none of their drawbacks. The prices for copies are moderate and compare very favourably with other processes. Altogether Velography has a great future before it.

Builders' Notes.

Annual Dinners.—The Scarborough Master Builders' Association held its annual dinner on December 15th, Mr. R. H. Carr, president, occupying the chair. The Wigan and District Master Builders' Association also held its annual dinner on the same date, the chair being occupied by Councillor R. Bannister, J.P., the president, and the vice-chair by Mr. W. Livesay, the vice-president.

Telephone Address.—Messrs. Wailes, Dove & Co., Ltd., of Cromwell Buildings, the manufacturers and patentees of the well-known "Bitumastic" solution and enamels, due to their rapidly increasing business in Manchester and district, have had the National telephone installed in their local office at Cromwell Buildings, 11, Blackfriars Street, Manchester. Their number is 280x Central.

Building Trades in November.—In spite of the general improvement in employment, the building trades continue to be very dull. Employment in them, indeed, was rather worse in November than in October. The percentage of Trade Union members unemployed among carpenters and joiners was 8·3 at the end of November, as compared with 8·0 in October and 10·1 in November, 1904. The percentage for plumbers was 11·1 at the end of November, compared with 12·0 in October and 10·5 a year ago. A general and more than seasonal improvement may be confidently looked for, however, in the spring.

NEW LONDON BUILDINGS.

AT the last meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894:—

An addition to No. 25, Clapham Road, Clapham, on the application of H. Wakeford & Sons, on behalf of H. J. Doughty. (*Consent.*)

Eleven houses on the north side of Halsmere Road, Flodden Road, Camberwell, on the application of P. Arundell & Sons. (*Consent.*)

Projecting porches to seven houses on the south side of Rodenhurst Road, Clapham, on the application of J. Carmichael. (*Consent.*)

Buildings on the side of Nos. 24 and 26, Peckham Rye, Dulwich, to abut also upon Nigel Road, on the application of W. T. Champion. (*Consent.*)

Buildings on the south side of Upper Richmond Road, Putney, eastward of Roehampton Lane, on the application of E. J. Partridge, on behalf of H. J. Hawkins. (*Consent.*)

Iron and glass shelter in front of the main entrance to the Hotel Russell, Russell Square, Holborn, on the further application of J. W. Singer & Sons, Ltd., on behalf of the Fredericks Hotel Co. (*Consent.*)

Three houses, and the retention of nine houses, on the east side of Garratt Lane, Wandsworth, between Quinton Street, and Littleton Street, and the retention of a house on the west side of Tranmere Road, abutting upon Quinton Street, on the application of Holloway Brothers. (*Consent.*)

Two houses, with bay windows and porches, on the north side of Garratt Lane, Lower Tooting, between the houses known as Coplestone House and No. 1, Alice Terrace, on the application of W. & C. Brown. (*Consent.*)

Re-erection of Nos. 74, 8, 9 and 10 Paddington Green, Paddington, on the application of W. F. Meakin & Son, on behalf of Brooks, Phillips & Co. (*Refusal.*)

Buildings on the site of No. 247, Lower Road, Deptford, on the application of J. H. Bethell, on behalf of H. Belsham. (*Refusal.*)

Projecting showcase in front of No. 60, New Bond Street, St. George, Hanover Square, on the application of S. Godward. (*Refusal.*)

Buildings with external walls at less than the prescribed distance from the centres of the roadways of Wood's Buildings and King's Court, Great Eastern Street, Hoxton, on the application of T. H. Smith, on behalf of Brown Brothers, Ltd. (*Consent.*)

Retention of a cycle house of a temporary character in front of No. 26, Victoria Road, Kensington, on the application of D. F. Pennant. (*Consent.*)

Retention of a cycle house of a temporary character erected in front of No. 22, Sisters' Avenue, Battersea, on the application of J. W. Mead. (*Consent.*)

Five projecting pilasters on the Ficcadilly frontage and five projecting pilasters on the Old Bond Street frontage of buildings upon the site of Nos. 44, 45 and 46, Old Bond Street, and Nos. 57, 58, 59 and 60, Piccadilly, St. George, Hanover Square, on the application of Read & MacDonald. (*Consent.*)

Addition of iron brackets and electric lights to an iron and glass shelter at the entrance of the Gaiety restaurant, Strand, on the application of Jones & Willis, Ltd. (*Consent.*)

A building with a projecting balcony in front on the southern side of the Embankment, Putney, eastward of Ruvigny Mansions, on the application of Bartlett & Ross, on behalf of G. Ayling. (*Consent.*)

Erection of No. 22, Atherfold Street, Stockwell, with a projecting portico, on the application of V. Vagnolini, on behalf of W. P. Goosey. (*Consent.*)

One-storey shops in front of Nos. 3 to 10 (inclusive) and 13 to 16 (inclusive), Magdalen Parade, Garratt Lane, Earlsfield, on the application of T. Sheppard & Co. (*Consent.*)

Buildings on the south-east side of Wyndham Road, Camberwell, at the rear of the "Clarendon" public-house, on the application of F. A. Powell, on behalf of W. Smith. (*Refusal.*)

Additions to No. 154, Stanstead Road, Lewisham, to abut upon Colfe Road, on the application of G. Tolley, on behalf of A. McLean Cato. (*Refusal.*)

Competitions Open.

CITY OF BIRMINGHAM.

COUNCIL HOUSE EXTENSION.

TO ARCHITECTS.

The Lord Mayor and Corporation of the City of Birmingham are desirous of EXTENDING the present MUNICIPAL BUILDINGS, and invite ARCHITECTS to submit DESIGNS for the same.

Sketch Plans only are required to be sent in by MARCH 31, 1906, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete Designs in a final competition amongst those so selected.

The Corporation has appointed Sir ASTON WEBB, R.A., and Mr. E. INGRESS BELL to act for them as their Professional Advisers in this competition.

Particulars of conditions, with Plan of Site, &c., can be obtained on the payment of One Guinea (to be returned to bona fide competitors), on application to the Town Clerk, Council House, Birmingham.

Legal Notice.

PATENTS, DESIGNS, AND TRADE MARKS ACTS, 1883-1902.

NOTICE is hereby given that JOHN HENRY DUKE, of 247, North Boulevard, Hull, seeks leave to amend the Specification of Letters Patent No. 288, 1905, granted to him for "Improvements in and relating to Valves with removable seats." Particulars of the proposed Amendment were set forth in the Illustrated Official Journal (Patents) issued on the 29th November 1905.

Any Person, or Persons, may give Notice of Opposition (on Form G) at the Patent Office, 25, Southampton Buildings, London, W.C., within one calendar month from the date of the said Journal.

C. N. DALTON,
Comptroller-General.

Educational.

"Every Architect must now have a good working knowledge of steelwork construction . . . undoubtedly this system of building will be universal in the near future."—vide *Builders' Journal*.

THE MIDLAND ENGINEERING BUREAU'S SYSTEM OF SCIENCE CORRESPONDENCE TUITION IN STRUCTURAL STEELWORK has been specially designed to supply a thoroughly good working knowledge of this class of Steelwork, and has been unanimously endorsed by the PRESS and leading Practitioners. The Tuition Department of the BUREAU has been in operation for nearly four years, has students in every part of the world, and is the only proved system which has stood the test of time.

Booklet J (4th edition), post free on request, proves these statements, gives Press Notices, numerous testimonials and the fullest information. The KEYNOTE OF THE WHOLE SYSTEM is "nothing but the soundest practical knowledge specially arranged for every day work."

THE MIDLAND ENGINEERING BUREAU, STRAND, DERBY.

I WANT TO GIVE YOU A BETTER POSITION AND BETTER PAY.

I know I can do this for you by our successful system. We give you the right training to enable you to leave the overcrowded and poorly-paid trades, where the supply always exceeds the demand, where the unemployed question is prominent, and enter the paying and up-to-date profession of Electrical Engineering. We have done this for thousands, and can do the same for you. We train you by post, in your spare time, direct to your home, and at little cost to yourself.

I SEND YOU FREE

our interesting book, "How to Become an Electrical or Mechanical Engineer." It tells you the story of success in life, and gives you convincing proof that I will carry out what I state. We train you in Electrical Engineering, Electric Tramways, Electric Light and Power, Dynamo Tenders, Mechanical Engineering, etc., etc.

Don't miss this opportunity—it is too good to lose—but write to-day for this free book to SECRETARY,

ELECTRICAL ENGINEER INSTITUTE OF
CORRESPONDENCE INSTRUCTION,
444, Norwich House, Southampton St.
HOLBORN, LONDON.

THE ARCHITECTURAL AND BUILDING EVENTS OF 1905.

GENERAL REVIEW.

IN our architectural world the past twelve months merit particular distinction by reason of the advances made in respect of an organized scheme of education. The importance of this cannot be over-estimated. The Board of Architectural Education has not even yet become an actual living force, but it is on the point of being made so; and the fact that within the past few months a group of eminent architects hitherto outside the Institute for one reason or another have come forward and joined hands with it over this matter of education argues well for the future.

Connected with this subject in more or less degree is the question of registration. Up and down the country the feeling for a definite recognized status has been growing in strength, and the numerous resolutions in favour of registration secured by two travelling apostles—Messrs. Hubbard and Cross—who have read papers on the subject before the leading provincial societies during the year, indicate that although the opinion of architects of eminence who bask in the sunshine of prosperity is certainly not in favour of carrying through any Bill for the Statutory Enrolment of Architects, the growing bulk of opinion is likely to force the adoption of such a Bill, or at least to make an attempt to get it through Parliament. It is necessary, however, to record the fact that the Institute elections this year quite upset the out-and-out registrationists, having practically cleared the council of such adherents.

Of purely professional interest, perhaps no matter has received more general attention than the case of *Gibbon v. Pease*, affecting the ownership of drawings, which was heard in the Court of Appeal in March. According to this decision, the law remains that after the completion of a work and the payment of the architect's fees the building owner can claim the contract drawings, specifications and appurtenant papers: though, when the legal spectacles are taken off, it is clear that such a right is grossly extravagant.

Turning now to buildings which have been proposed, begun and completed during the past year.

In London the new War Office in Whitehall claims first attention. The exterior is now practically complete, and work on the interior is well advanced. The chief front, to Whitehall, with its central columnar treatment and rounded wings, has been disclosed free from its scaffolding, and it will be admitted that the general effect is very good. The centre portion is by far the best, however; it is excellent; but the wings do not group happily with it. Still, Mr. Drury's emblematic groups go far to save the building. In this work the sculptor has followed the feeling of his master—the great

Dalou—and the breadth of effect he has given to these groups merits their inclusion among the best sculpture on London buildings. While referring to this subject it is opportune to note the very different treatment—very effective, nevertheless—which Mr. Pomeroy has adopted in his work at the Central Criminal Court in Old Bailey. Here the sculpture is much flatter; and though the opportunity was not anything like that afforded by the huge Government building in Whitehall, the refined sense of the artist is apparent in every part. This new sessions house, the design of Mr. Mountford, has been brought well on to completion, and work is now far advanced on the great dome.

At the bottom of Whitehall the erection of the huge block for the Local Government Board has been going on quietly, though in the past session of Parliament one facetious member took occasion to ask whether work on the building had stopped, as appeared to the passer-by.

At South Kensington Sir Aston Webb's extension to the museum has progressed so well that the building is now being roofed.

In Newgate Street, on the site of Christ's Hospital, a commencement has been made with the erection of the new post-office designed by Sir Henry Tanner of the Office of Works.

Among other London buildings not connected with Government which have been completed during the year may be mentioned the new Gaiety Hotel in the Strand—certainly a very substantial and on the whole successful effort; the Waldorf and Aldwych Theatres close by; the Scala Theatre, off Tottenham Court Road, where Mr. Verity has made another excursion in design, not perhaps so successful as his Imperial Theatre; Waring & Gillow's new premises in Oxford Street—rich with sculptured ornament, and promising to be a very fine building; and the corner block for the Liverpool and London and Globe Assurance Co. facing the Mansion House (by Mr. Macvicar Anderson—good in general outline but uninteresting in detail).

To the list of London hotels must be added the Ritz in Piccadilly, now almost complete; the Piccadilly, for which St. James's Hall and Restaurant have been demolished; and the Waldorf, behind the Gaiety block: these two last being now at foundation stage only.

In the provinces numerous important buildings have been erected. First may be mentioned the new town hall and law courts in Cathays Park, Cardiff. This is the largest work of its kind in progress, and it has now been so far advanced that the buildings are expected to be completed next summer.

Walsall Town Hall is another notable building of the year, and among other new buildings of this class must be included Deptford Town Hall and Mr. Hare's buildings

at Crewe, both opened in July, and the very fine scheme for Bournemouth prepared by Mr. Lacey and Mr. Mallows, this last scheme having been recently adopted by the town council.

In university and school work there are many interesting buildings to record. The very extensive Royal Naval College at Dartmouth was opened in September—this being one of Sir Aston Webb's most successful buildings: at Cardiff the foundation-stone of the new university buildings designed by Mr. Caröe was laid by the Prince of Wales in June: at Aberdeen the large addition to the university—Marischal College—has been completed so far as the outside is concerned, this being the work of Mr. Marshall Mackenzie: at Sheffield the new university buildings, designed by Mr. E. M. Gibbs, were opened by the King and Queen in July: and at Portishead the Nautical School was completed from Mr. Gabriel's designs.

At Bristol the new art gallery—a fine building—was opened in March; the new Aberdeen Art Gallery in April; and the Municipal School of Art at Hull in October.

A great number of memorials up and down the country have been erected, but many of them are of poor merit. We single out, however, the splendid army memorial at Aldershot, for which Mr. Schultz and Mr. Goscombe John were responsible; Mr. Framp-ton's fine memorial of Queen Victoria which has been erected in front of the town hall at Leeds; the Gladstone memorial in the Strand by Mr. Thornycroft; and Mr. Ingress Bell's South African Memorial Arch at Chatham.

Innumerable libraries throughout the country have been erected during the year. Of these we would specially mention Mr. Hare's at Hammersmith, the new libraries at Glasgow by Mr. Rhind, and the library at Taunton by Mr. Colbourne Little and Mr. Goodison.

Among hospital and similar work we have to record the opening of the new Royal Naval Hospital at Chatham, where some very good work has been done by Mr. Murray, the new Dental Hospital at Birmingham by Messrs. Bateman & Bateman, the Crossley Sanatorium in Cheshire by Mr. Hardisty, the huge new asylum for Middlesex at Napsbury by Messrs. Rowland Plumbe & Harvey, and the Hammersmith Workhouse and Infirmary by Messrs. Giles, Gough & Trollope.

The obituary for 1905 contains the names of many well-known men, notably Mr. Waterhouse, Mr. Blashill, Mr. Mansergh and Lord Grimthorpe.

So far as the building trades are concerned the year has been very dull, but it is hoped that trade has now taken a turn for the better and that next year the building trades will feel the effect of this.

Webster Cottage Hospital, Shanklin, I.W. E. B. T'Anson, Architect.

The Recreation and Dining Hall, Napsbury Asylum.

Seamen's Hospital, Ferry Road, Cardiff. E. W. M. Corbett, Architect.

Napsbury Asylum, Middlesex. Rowland Plumble and Harvey, Architects.

Crossley Sanatorium, Delamere Forest, Cheshire. W. Cecil Hardisty, Architect.

Winsley Sanatorium, Wilts. Silcock and Reay, Architects.

Homes for Epileptic Children, Lingfield, Surrey. T. Phillips Figgis, Architect.

Hospitals, Infirmarys, Sanatoria.

On July 26th His Majesty the King visited Chatham and opened the new Royal Naval Hospital. This building is divided into two main parts: the general hospital, accommodating 468 beds, and the zymotic hospital, accommodating 102 beds—a total of 570 beds. The large wards in the general hospital are 120ft. by 28ft. 6ins. The total cost of the building was about £330,000, exclusive of furnishing. Mr. John C. T. Murray, F.R.I.B.A., was the architect, and Sir Henry Pilkington, R.E., the civil engineer-in-chief; the work having been carried out under the superintendence of Mr. S. P. Brinson, Admiralty architect.

On July 6th Sir Oliver Lodge opened the new dental hospital which has been erected in Great Charles Street, Birmingham, at a cost of £10,000. Messrs. Bateman & Bateman were the architects.

At Cardiff a new seamen's hospital in Ferry Road was erected. The wards are on three floors and provide accommodation for fifty-four beds. The cost has been about £30,000. Mr. E. W. M. Corbett was the architect.

At the Glasgow Western Infirmary a new dispensary was opened about the middle of January, the work having been carried out from designs by Messrs. John Burnet & Son. The general waiting-hall is 86ft. by 31ft., and is seated for more than 400 persons.

In September Princess Henry of Battenberg opened the Arthur Webster memorial cottage hospital which has been presented to Shanklin by Lord Alverstone. It comprises male and female wards, operating theatre, dispensary and offices, and was designed by Mr. E. B. T'Anson.

Winsley Sanatorium, Wilts., was completed from designs by Messrs. Silcock & Reay, of Bath, at a total cost of £10,000. Accommodation is provided for sixty patients.

New Dispensary, Glasgow Western Infirmary.
John Burnet & Son, Architects.

Dispensary, Nottingham.
Ernest & Sutton, Architects.

Convalescent Home for Men, Little Common, Bexhill.
Rowland Plumbe and Harvey, Architects.

Administrative Block, Royal Naval Hospital, Chatham.
John C. T. Murray, F.R.I.B.A., Architect.

Medical School and Nurses' Home, University College Hospital, London.
Paul Waterhouse, Architect.

An isolation hospital at Trowbridge was erected at a cost of £9,150, or £340 per bed (accommodation for thirty patients). Mr. J. Hugh Goodman was the architect.

A new public health laboratory at York Place, Oxford Road, Manchester, was completed at a cost of £13,000. It has grown out of the bacteriological department of the Owens College (now the University of Manchester), and was planned by Professor Delépine.

At the end of May the convalescent home for men at Little Common, Bexhill-on-Sea, was completed, so far as funds permitted. The total cost of the building (exclusive of site) will be about £20,000. Messrs. Rowland Plumbe & Harvey are the architects.

The Crossley sanatorium for consumptives, in Delamere Forest, Cheshire, was opened in the summer. It has been erected at a cost of more than £70,000 from designs by Mr. W. Cecil Hardisty, of Manchester, and comprises twenty-four patients' rooms with single beds, one with two beds, ten wards with four beds and four wards with six beds. The façade of the main building is 300ft. in length.

At Napsbury, near St. Albans, the large county asylum for Middlesex was opened in June. The architects were Messrs. Rowland Plumbe & Harvey. This asylum accommodates 1,150 patients, and the main corridor is altogether about a quarter of a mile long. The total cost has been £385,000. Messrs. Charles Wall, Ltd., of Chelsea, were the builders.

New Dental Hospital, Great Charles Street, Birmingham.
Bateman and Bateman, Architects.

Dentists' Chambers, Cornwall Street, Birmingham.

At Leicester infirmary a new out-patients' block was opened in March. Messrs. Everard & Pick were the architects.

In July the Princess Louise opened new buildings and extensions to the Christian Social Service Union's colony at Lingfield, Surrey, erected from designs by Mr. T. Phillips Figgis, F.R.I.B.A. The colony comprises homes accommodating 100 children, and is the outcome of a movement started a few years ago with the object of removing

epileptic children from the imbecile and senile wards of workhouses and asylums, and providing them with the brighter and more healthful surroundings of the country.

Mr. Paul Waterhouse prepared a design for the new medical school and nurses' home which is to be built in University Street, facing University College Hospital, London, at a cost of £73,000. It is the gift of Sir Donald Currie.

New War Office, Whitehall, London. The late William Young, Architect.

A large new workhouse and infirmary at Wormwood Scrubbs, for the Hammersmith Board of Guardians, was opened by Princess Henry of Battenberg on December 1st. The infirmary accommodates 330 sick persons and the workhouse 428 destitute poor. The cost of the buildings was £207,000, exclusive of £14,400 for the site (about 14½ acres). A feature of the workhouse is the provision of comfortable quarters for aged married couples, which will prevent their separation in the workhouse. The architects for this large scheme were Messrs. Giles, Gough and Trollope, the contractor being Mr. Thomas Rowbotham, of Birmingham.

Government Buildings.

The new War Office in Whitehall, estimated to cost £475,000, was completed so far as the exterior is concerned, and work on the interior is making rapid progress. The frontage to Whitehall measures 250ft., but that to Whitehall Place, at the rear, is 470ft. Notable features of the building are the sculptured groups by Mr. Alfred Drury, A.R.A., emblematic of Peace, War, Victory and Justice. The building was designed by the late William Young, whose work is being carried on by his son, Mr. Clyde Young, in consultation with Sir John Taylor of the Office of Works.

At the bottom of Whitehall the new offices for the Local Government Board were proceeded with and the side facing Parliament Square was carried to its full height; the work, however, is so large that progress appears to the passer-by to be slow.

At one corner of Lincoln's Inn Fields the new Land Registry Office was erected, of red brick with stone dressings.

The New Post-office Building, Newgate Street, London.
Sir Henry Tanner, Architect.

On October 16th the King laid the foundation-stone of the new Post-Office building which is to be erected on two-thirds of the site of Christ's Hospital in Newgate Street, London. The design has been prepared in the Office of Works under the direction of Sir Henry Tanner.

The Victoria and Albert Museum extension in course of erection at South Kensington made considerable advance, and is now being roofed. Sir Aston Webb and Mr. E. Ingress Bell are the architects of this large block of buildings.

New Inland Revenue offices at Cardiff were erected at a cost of £20,000, the architect being Mr. H. N. Hawks, I.S.O., of H.M. Office of Works.

The Building Trades.

Bad though the year 1904 was for the building trades, the past twelve months have been still worse. All branches have felt it, and it is always some time before the building trades feel the effects of an increase in the general trade of the country, which is now, we are glad to state, showing signs of improvement. Bankruptcies of small builders have been fairly numerous. The slackness of trade has been generally referred to at all the meetings of contractors' associations, and it has been a noticeable feature how keen the competition has been in tenders, large firms finding it necessary to go in for comparatively small jobs. It is only those branches of the building trades more closely connected with the engineering industry that have received a fair share of business. In the large towns of course there is always a good deal of work going on, and in London the rebuilding of areas has proceeded apace. There has been a more general adoption of fire-resisting construction in recent years, and during the past year firms connected with this branch of construction have increased in number, while the older firms have extended their business.

Reinforced Concrete.

The use of reinforced concrete for all kinds of structural work has been extended in this country during the year, and this form of construction promises to be still more largely adopted in the future.

Building Accidents.

During the past year a number of structural accidents have occurred, many of them, however, not particularly serious. The collapse of two bays of Charing Cross Railway Station roof on December 5th, due to the snapping of a tie-rod, was the most serious. These bays had a span of 164ft. and together were 70ft. long. Immediately after this terrible accident steps were taken to secure the roof against future collapse, but, on the report of the consulting engineers, Sir Benjamin Baker and Sir John Wolfe Barry, it was decided to remove the old roof and substitute one of modern type. A wall at Croydon was weakened in the course of reconstructing the theatre early in December, and fell down. Earlier in the year the upper floor of a two-storeyed building at Burslem used as a tile works collapsed, owing to being overloaded by the storage of tiles. The other accidents were smaller, but all tend to show that more supervision is needed to guard against the effects of decay and overloading.

Administration Building, Hammersmith Workhouse and Infirmary. Giles, Gough and Trollope, Architects.

University College Schools, Hampstead. Arnold Mitchell, Architect.

Scheme for the Rebuilding of King's College Hospital at Camberwell. W. A. Pite, Architect

Epsom Parish Church.
Nicholson and Corlett, Architects.

Lambeth Municipal Buildings. Hall and Warwick, Architects.

Worthing Public Library. H. A. Crouch, Architect.

Central Library, Islington. Henry T. Hare, Architect.

Public Library, Cheshunt, Herts. J. Myrtle Smith, Architect.

School, Ferndale Road, Swindon. Nicholls and Stockwell, Architects.

Mitchell Library, Glasgow. William B. White, Architect.

COMPETITIONS OF 1905.

Award Announced.	Building.	Cost.	Assessor.	Successful Competitors.	Remarks.
January	Cottage Hospital, Crief	£ 1,400	W. H. Mungall, Civil Engineer, Crief.	Edward C. H. Maidman	14 designs submitted.
"	Parish Church, Elgin	4,000	Congregation	P. Macgregor Chalmers	Limited to 3 selected architects.
"	Converting School Buildings at Norwood into Home for Aged People.	3,950	Works Committee	1st E. C. Beaumont, 2nd W. M. Weir.	
"	University College School, Hampstead.	—	Sir Aston Webb	Arnold Mitchell	Limited to 5 selected architects.
"	Elementary School, Northwich	10,500	H. Beswick (Co. Architect for Cheshire).	A. E. Powles	Limited.
"	Sir Hector Macdonald Memorial, Edinburgh.	—	Sir Rowand Anderson.	1st W. Burnie Rhind, 2nd Edward C. H. Maidman.	
"	Sir Hector Macdonald Memorial, Dingwall.	—	—	1st James S. Kay, 2nd Edward C. H. Maidman	About 160 designs submitted.
February	Carnegie Library, Wardle	1,500	District Council	Butterworth & Duncan	Limited competition.
"	Cottage Hospital, Moffat	1,100	Sydney Mitchell	Edward C. H. Maidman	40 designs submitted.
"	Public Offices, Seacombe, Cheshire	50,000	Sir William Emerson.	1st (250) Briggs & Wolstenholme and Arnold Thornely, 2nd (275) A. R. Jemmett and G. T. M'Combie, 3rd (250) W. H. Ashford	96 designs submitted.
"	Schools in Keynsham Rd., Cheltenham	7,268	Committee	1st Chatters & Smithson, 2nd Healing & Overbury, 3rd H. E. Lavender.	For 750 children.
"	Three Carnegie Libraries, Belfast	12,000	Sir Thomas Drew	Graeme-Watt & Tulloch.	
"	Northumberland War Memorial, Newcastle.	2,000	Hamo Thornycroft	1st T. Eyre Macklin, 2nd (20) C. S. Errington, 3rd (210) F. W. Doyle Jones	41 designs submitted.
"	New Infirmary, Alnwick	—	Frank Caws	1st (210) J. Wightman Douglas & Boyd & Groves, 2nd (250), divided, Stephen Piper & Armstrong & Wright.	Limited to architects practising in Northumberland and Durham.
March	Carnegie Library, Nelson	7,000	G. H. Willoughby	1st (250) W. Brandreth Savidge & J. R. Poyser, 2nd (225) D. Bird & G. Fox, 3rd (215) H. T. Rees.	207 designs submitted.
"	Carnegie Library, Townhill, Dunfermline.	3,500	Carnegie Dunfermline Trust.	1st Peter L. Henderson, 2nd (225) James T. Scrobie, 3rd (215) Henry F. Kerr, 4th (210) Kerr & M'Culloch.	More than 60 designs submitted.
April	Church at New Somerby, Grantham	—	G. H. Fellowes Prynne.	Betram H. Tarrant	104 designs submitted.
"	Shire Hall, Bury St. Edmunds	7,860	Council assisted by Surveyor.	1st (250) Arthur Field, 2nd (230) O. Mahomed & B. H. Tarrant, 3rd (220) Warwick & Hall.	
"	Council School, Accrington	15,000	—	1st (250) Fairhurst & Holt, 2nd (225) Shaw & Vowles, 3rd (210) Sproat & Clayton.	To accommodate 1,000 scholars.
"	Public Library, West Islington	—	John Belcher	Prof. Beresford Pite	Limited.
"	Congregational Church, Crookes, Sheffield.	—	E. M. Gibbs	1st (220) W. J. Hale, 2nd (210) W. T. Campsall.	
"	Council Schools, Preston	8,000	F. W. Catterall	1st (250) H. Howarth, 2nd (230) A. Brocklehurst, 3rd (220) F. Quentery Farmer.	
"	Clock Tower, St. George's Circus, London, S.E.	3,843	Thomson & Pomeroey.	1st J. F. Groll, 2nd Leslie Wilkinson, 3rd Alexander Peacock.	On site of Obelisk. 106 designs submitted.
"	School, Caversham	11,000	G. D. Holman	1st William A. Ashford, 2nd La Trobe & Weston, 3rd G. H. Blatherwick.	
May	Sunday School Centenary Memorial Hall, Stockport.	15,000	A. I. Murgatroyd	Potts, Son & Hennings	16 designs submitted.
"	Carnegie Library, Wrexham	3,500	W. E. Willink	1st (226 ros.) Vernon Hodge, 2nd (215 15s.) Graeme-Watt & Tulloch.	104 designs submitted.
"	Infectious Diseases Hospital, Altrincham.	7,500	Frank Briggs	William Owen	Limited competition.
"	King's College Hospital Rebuilding, Camberwell	400,000	Rowland Plumbe	W. A. Pite	6 architects invited to submit designs.
"	New Vicarage, St. Mary's, Rochdale	1,700	No assessor	Jesse Horsfall	Limited, three competitors.
"	Council School, Richmond, Surrey	10,300	Education Committee.	1st E. J. Milner Allen, 2nd C. Harrison Townsend	To accommodate 500 children.
"	New Cemetery, Wilmslow	4,500	H. Beswick (Co. Architect for Cheshire).	1st (225) W. Longworth, 2nd (215) H. C. Cullock, 3rd (210) C. T. Taylor.	Mr. Taylor's design accepted by urban district council.
"	New Baths and Washhouses, South Shields.	12,000	A. W. S. Cross	J. H. Morton	10 designs submitted.
"	Municipal Buildings, Lambeth	35,000	Henry T. Hare	1st Warwick & Hall, 2nd (220) H. P. Burke Downing, 3rd (200) Crouch, Butler & Savage.	143 competitors.
"	School, Taunton	9,000	Charles Hadfield	1st H. Dare Bryan & F. W. Roberts, 2nd Samson & Cottam, 3rd, Price & Jane.	12 designs submitted.
"	Elementary School, Aylesbury	9,200	T. W. Cutler	1st J. Moir Kennard & H. Kennard, 2nd (225) A. Hendy & John Cash & M. S. Hack (divided).	
"	Boys' School, Buxton	4,000	G. H. Widdowes	1st Charles Swain, 2nd Garlick & Flint, 3rd W. R. Bryden.	
"	Police-court Extension and Fire-brigade Depot, Bristol.	48,000	—	1st (252 ros.) A. Southcombe Parker, 2nd H. Williams	15 designs submitted. Work postponed for three years.
"	Elementary School, Wolverton	7,846	T. W. Cutler	1st Harrington, Ley & Kerkham, 2nd Frank T. Baggallay	820 children.
"	Secondary School, Wolverton	4,218	T. W. Cutler	1st Harrington, Ley & Kerkham, 2nd G. Sedger.	165 scholars.
"	Davie's Memorial Laboratories, Aberystwyth.	20,000	—	Alfred W. S. Cross	Limited competition.
June	Baths and Washhouses, Hammer-smith.	45,000	Committee and Borough Surveyor.	J. Ernest Franck	Limited to 6 selected architects.
"	Public Library, Worthing	15,000	John Belcher	1st (250) H. A. Crouch, 2nd (225) Lanchester & Rickards, 3rd (215) Russell & Cooper, 4th J. O. Gibson.	15 designs submitted.
"	Council Schools in Bournemouth Park Road, Southend-on-Sea.	14,000	Education Committee.	1st Greenhalgh & Brockbank, 2nd G. E. Clare, 3rd D. H. Smith.	Final selection made from 9 designs out of 132 originally submitted.
"	Wesleyan Connexional Hall and Offices, Westminster.	140,000	Sir Aston Webb	Lanchester & Rickards	20 designs submitted. Competition limited to local architects.
"	Twenty Dwelling-houses, High Win-cobank, Sheffield.	2,520	E. M. Gibbs	1st H. L. Paterson, 2nd W. Spencer Smith	49 designs submitted.
"	Carnegie Library, Radcliffe	5,000	G. H. Willoughby	1st (250) H. Lord, 2nd — Adshead, 3rd David Bird	16 designs submitted.
"	Girls' Secondary School, High Wycombe	3,500	—	1st Arthur T. Greenwood, 2nd C. H. Norton, 3rd F. W. Mee	4 designs submitted.
"	Extension, Coventry and Warwick-shire Hospital.	35,000	E. T. Hall	A. Hessel Tiltman and H. W. Chattaway	
"	Primitive Methodist Orphanage Home, Harrogate.	—	F. W. Dixon	1st (225) Oldham & Hill, 2nd (215) Boyd & Groves	36 designs submitted.
"	Three-Department School, Rose Green, Bristol.	—	Education Committee.	Herbert J. Jones & Son	17 designs submitted. School to accommodate 1,190 children.
"	School, Ferndale Road, Swindon	12,500	W. L. Bernard	Nicholls & Stockwell.	
"	Harrogate Infirmary Extension	5,000	G. B. Bulmer	1st (225) H. E. & A. Bown, 2nd (215) Bolshaw & Steevens, 3rd (210) T. E. Marshall.	12 designs submitted by local architects.
"	Central Public Library, Islington	35,000	John Belcher	Henry T. Hare	Limited to 8 selected architects.
"	Welsh C.M. Church, Tretrw	3,500	Committee	G. Dickens-Lewis	Limited competition.
July	Housing Scheme, Guildford	£183 each for eight cottages.	Committee	1st (220) T. J. Capp	2 other competitors.
"	Mitchell Library, Glasgow	44,479	A. B. M'Donald, City Engineer, John Keppie and F. T. Barrett (Librarian).	1st (2100) John Arthur, 2nd (75) Sydney K. Greenslade, 3rd (250) James R. Rhind.	Design by W. B. White accepted. 76 designs submitted.
"	Public Elementary School, Leigh	9,000	Mervyn Macartney	1st J. C. Prestwich, 2nd J. B. Thornley, 3rd Potts, Son & Hennings.	Limited to 14 selected architects.
"	New Charity Schools, Rothbury	3,000	F. W. Rich	1st H. Miller, 2nd J. G. Burrell, 3rd Charles S. Errington, 4th C. Franklin Murphy.	Accommodation for 900 children.
"	Branch Library, Cathays, Cardiff	4,750	H. V. Lanchester	1st (275) Speir & Beavan, 2nd (250) E. M. Bruce Vaughan	20 designs submitted.
"	Branch Library, Canton, Cardiff	4,750	H. V. Lanchester	1st (275) E. M. Bruce Vaughan, 2nd (250) Speir & Beavan	Do.

Competitions of 1905—continued.

Award Announced.	Building.	Cost.	Assessor.	Successful Competitors.	Remarks.
August	Schools, Bexhill - - -	£6,000	A. H. Ryan-Tenison.	1st H. P. Burke Downing, 2nd W. S. A. Gordon, 3rd A. Jessop Hardwick.	106 designs submitted.
"	Baptist Church and Schools, Consett, co. Durham.	3,500	Committee -	George Baines & R. Palmer Baines.	
"	Council School, Stanfree, Bolsover -	1,600	Committee -	Clarence R. Ross.	
"	Council Schools, Langwith Bassett and New Bolsover.	2,000 & 4,000	Committee -	H. Tatham Sudbury.	
Sept.	Technical Institute, Rochester -	—	Frank T. Baggallay	1st Russell & Cooper, 2nd Crouch, Butler & Savage, 3rd W. H. Knowles.	131 designs submitted.
"	Chapel and School, Shearbridge, Bradford.	6,000	W. E. Potts -	1st (£10 ros.) Edgar H. Parkinscn, 2nd A. Sharp -	Limited to four selected Bradford architects.
"	School, Reddish, Stockport -	11,000	J. W. Simpson -	1st Cheers & Smith, 2nd Winder & Taylor, 3rd Adshead & Holt.

Libraries.

The new central library at Hammersmith was completed and opened by the Duke of Argyll on July 24th. This is the gift of Mr. Andrew Carnegie, and has cost £14,500. The architect was Mr. Henry T. Hare, whose design was selected in a limited competition.

A new public library at West Derby, Liverpool, was built at a cost of £15,700 from designs prepared by the Corporation architect and surveyor, Mr. T. Shelmerdine.

At Hull the Carnegie branch library in the West Park was completed from designs by the city architect, Mr. Joseph H. Hirst.

At Taunton the new free library opposite the municipal buildings was erected. Messrs. A. T. Colbourne Little and Ingleson C. Goodison were the architects.

Two new libraries at Glasgow, the Woodside library and the Crosshill and Govanhill district library, were completed from designs by Mr. J. R. Rhind.

Harrogate Public Library.
Henry T. Hare, Architect.

At the beginning of October the foundation-stone of a public library at Southend-on-Sea, to which Mr. Carnegie contributed £8,000, was laid. Mr. Henry T. Hare is the architect.

A new central library at Greenwich was erected at a cost of about £10,000 from designs by Mr. Sydney R. J. Smith, F.R.I.B.A. It was opened at the beginning of November.

A free library was built at Eastbourne from designs by Mr. Philip A. Robson, A.R.I.B.A.

Baths.

New Carnegie baths at Dunfermline were opened in April. The buildings have been designed by Mr. Hippolyte J. Blanc, R.S.A., and comprise swimming baths and other baths, and a gymnasium 103ft. by 45ft. The cost has been about £36,000. It is interesting to note that there are two paths around the main swimming bath—one for bathers and

the other for those going to and from the dressing-boxes.

New public baths at Camberwell, including Turkish baths, were opened in October. Mr. E. Harding Payne, A.R.I.B.A., was the architect.

New public baths at Hull were completed on a site at the corner of Beverley Road and Epworth Street. There are three swimming baths, forty-eight slipper baths, and spray baths, these last being a new feature for Hull. The building and engineering work was designed by the city engineer, Mr. A. E. White, M.I.C.E. The cost, including fittings, was £25,000.

At Bradford new district baths were opened on July 19th, serving the township of Bowling. In September the new central baths in Morley Street were opened. These latter were designed by Mr. A. Hessel Tiltman, of London, with certain modifications made by the city architect, Mr. F. E. P. Edwards. The cost of the central baths was about £30,000.

Law Courts, Fire-stations, Crematoria, Workmen's Dwellings, &c.

At the end of January the foundation-stones of the new quarter-sessions court, police buildings and fire-station at Sunderland were laid. This building is being erected from designs by Messrs. Wills & Anderson, of London, and Messrs. W. & T. R. Milburn, of Sunderland, and is likely to cost £40,000.

In Old Bailey the central criminal court has made rapid progress during the past year, so that at the present time the work on the great central dome is almost completed. Mr. E. W. Mountford, F.R.I.B.A., is the architect, Mr. Pomeroy is executing the decorative sculpture, and Sir William Richmond and Professor Moira will paint some lunettes inside. The building will be opened in November next year. Its cost is likely to be nearly £300,000.

The Tower Bridge Police Court was completed in March. This was erected from designs by Mr. J. Dixon Butler, and together with the adjoining police-station (opened last year) cost £45,000. The site cost £19,000.

The erection of Manchester's new chief fire-station on a site bounded by London Road, Whitworth Street, Fairfield Street and Minshall Street has been satisfactorily progressed with during the year. The estimated cost of the building is £85,000. Messrs. Woodhouse & Willoughby are the architects.

A new fire-station for the London County Council was erected at Kensington from designs by Mr. W. E. Riley, superintending architect.

A new fire-station at Ilford was erected at

a cost of £9,000 from designs by Mr. H. Shaw, A.M.I.C.E., surveyor to the council.

A crematorium at Bradford was opened at the end of July. There are 125 niches for urns. The cost of the building has been about £5,000. The furnace is by Fradet, of Paris, and is similar to the one at Leeds, these being the only two gas-heated furnaces in this country.

At Sheffield the Corporation crematorium was opened on April 5th. The building was designed by Messrs. C. & C. M. Hadfield.

In Bride Road, Dublin, a new block of workmen's dwellings with a plan like the letter **W** was erected from designs by Messrs. Joseph A. Smithden, of London, under the supervision of Messrs. Kaye Parry & Ross, of Dublin. There are 516 cubicles on the four floors above the ground storey.

The building of the new tramway offices in Hatton Garden, Liverpool, to which they have a frontage of 184ft., was proceeded with. The work is to cost nearly £50,000, and is being carried out from designs by Mr. Thomas Sheldermine, the Corporation architect and surveyor.

New car building and repair works for the Manchester Corporation were erected in Hyde Road from designs by Mr. John Gibbons, F.R.I.B.A., of Manchester.

New market buildings at Wellingborough, built at a cost of £12,000, were opened on November 1st.

A new central hall at Eccles was built at a cost of £3,000 from designs by Mr. Edward Hewitt, A.R.I.B.A., of Manchester.

Art Galleries and Schools of Art.

The new art gallery at Bristol, presented to the city by Sir W. H. Wills, was opened in March by Professor Herkomer. It adjoins the museum. Mr. Frank W. Wills, of Bristol, and Messrs. Houston & Houston, of London, were the joint architects.

The Aberdeen Art Gallery was opened in April by Sir George Reid. It is the outcome of a desire for a thorough teaching collection of casts arranged to show the history of sculpture from the Egyptian period. The total cost was £35,000, and the architects were Messrs. A. Marshall Mackenzie & Son.

The Municipal School of Art at Hull was opened on October 6th. The building has cost more than £20,000. Messrs. Lanchester & Rickards were the architects, their design having been selected in competition. The carving over the principal entrance has been done by Mr. Fehr, and the glass mosaic panel in the pediment beneath the roof by the Bromsgrove Guild of Handicraft, designed by Mr. Garth Jones.

The City School of Art at Bradford was opened on September 29th by the Marquis of Londonderry. Mr. F. E. P. Edwards, city architect, designed the building.

G. W. Milburn, Sculptor.

Royal Army Medical Corps' South African Memorial, Aldershot.
R. Weir Schultz, Architect. W. Goscombe John, A.R.A., Sculptor.

Memorials.

In front of Buckingham Palace the new gates and piers in connection with the national memorial to Queen Victoria were placed in position and the widened Mall was brought on from the Duke of York's steps to the Admiralty.

The Gladstone monument in the Strand, just westwards of the church of St. Clement Danes, was unveiled by Mr. John Morley on November 4th. Mr. Hamo Thornycroft, R.A., was the sculptor, assisted by Mr. John Lee, A.R.I.B.A., for the architectural portions of the work.

The Royal Engineers' South African Memorial at Chatham, in the form of an arch standing in the square formed between the Brompton Barracks and the Royal Engineers' Institute, was unveiled by His Majesty the King in July. The architect was Mr. E. Ingress Bell, F.R.I.B.A., and the builders were Messrs. Longley & Co. The arch is carried out in Portland stone and has a series of sculptured panels by Mr. W. S. Frith.

The Leeds memorial to Queen Victoria, in front of the town hall, was unveiled on November 27th. It consists of a bronze seated figure of the late Queen on a stone pedestal, and cost nearly £8,000. Mr. G. J. Frampton, R.A., was the sculptor.

The memorial statue to Queen Victoria at Nottingham, by Mr. Albert Toft, was unveiled at the end of July.

On July 29th Princess Alexandra of Teck laid the foundation-stone of the South African memorial buildings at Eton College. There is to be a school hall 140ft. by 55ft. and 45ft. high, an octagonal library of about 55ft. diameter, and a classical museum. Mr. L. K. Hall and Mr. Sydney K. Greenslade are the architects of the building, which is estimated to cost £40,000.

At Aldershot the splendid South African memorial erected by the Royal Army Medical Corps was unveiled by the King on May 24th. The architectural portion of the memorial was designed by Mr. R. Weir Schultz, and the sculptor work carried out by Mr. W. Goscombe John, A.R.A. The central group is of bronze, and the screen and pedestal of are grey Cornish granite.

At Liverpool the memorial to men of the King's Own Regiment, in St. John's Gardens, was unveiled by Sir George White on September 9th. There is a central figure of Britannia cast in bronze on a granite pedestal, with figures around. Mr. Goscombe John, A.R.A., was the sculptor.

At Birkenhead a memorial to Queen Victoria, in the form of an Eleanor cross, was unveiled in October. Mr. Edmund Kirby, F.R.I.B.A., was the architect.

On September 30th the Duchess of Argyll unveiled at Blackburn a marble statue of Queen Victoria by Mr. Bertram McKennal. It weighs nine tons.

A South African war memorial at Gateshead, in Saltwell Park, was unveiled by Sir John French in November. It was designed by Mr. F. Doyle Jones, of Hartlepool and Chelsea.

A memorial statue to Queen Victoria at York, in white marble, was unveiled by Princess Henry of Battenberg at the end of October. It is placed in the Guildhall, and is the work of Mr. G. W. Milburn, of York.

Model of Queen Victoria Memorial, Calcutta. Sir William Emerson, Architect.

A model of the huge building to be erected in Calcutta to the memory of Queen Victoria was completed, and exhibited at the Academy by Sir William Emerson, the architect for the work: a very large coloured perspective of the building was also exhibited.

Mr. Brock's bronze statue of Millais in front of the Tate Gallery, London, was unveiled on November 22nd.

Universities, Colleges and Schools.

The new university buildings at Sheffield were opened by the King and Queen on July 11th. They form three sides of a quadrangle. The building on the south side, facing the Western Bank, contains the large hall of the university, the building on the west accommodates the faculties of arts and pure science, and the building on the north the medical faculty. Mr. E. M. Gibbs was the architect.

At Cardiff the foundation-stone of the new buildings of the University College of South Wales and Monmouthshire was laid by the Prince of Wales in June. The scheme will involve a total cost of nearly £300,000. Mr. W. D. Caröe is the architect.

Work was carried on continuously at the extension to Aberdeen University—Marischal College—and by the end of the year the scaffolding was taken down from the main front. Work inside is well advanced and is expected to be finished by next autumn.

The college has a frontage of 400ft., including the new Greyfriars Church (which is really a part of the scheme), and is likely to cost £55,000. Mr. A. Marshall Mackenzie is the architect.

The new Royal Naval College at Dartmouth was opened on September 15th. It has been erected at a cost of £300,000, and will accommodate 400 cadets. The south front is 800ft. long. Sir Aston Webb was the architect.

On June 20th the foundation-stone of the new Western Theological College at Bristol was laid. This building is to cost £12,000, and occupies a site opposite Highbury Chapel. The architect is Mr. H. Dare Bryan, F.R.I.B.A.

A new wing at St. Edmund's College, Ware, was opened on May 24th. This addition cost £17,000, and was designed by Mr. F. A. Walters.

A new central higher grade school in Frederick Street, Aberdeen, with a total accommodation for 1,129 scholars, was erected at a cost of £18,000. Mr. J. A. O. Allan was the architect. A good part of the roof is flat and is used as a playground. Mechanical ventilation on the "plenum" system is adopted.

New schools at Gillingham, Kent, were erected at a total cost of £9,800 from designs by Mr. J. Hatchard Smith, F.R.I.B.A.

New council schools at Ealing, in Little Ealing Lane, were erected from designs by Messrs. Greenaway & Newberry, Westminster.

The nautical school at Portishead was completed from designs by Mr. Edward Gabriel, of London.

Extensions were made to the Leeds Grammar School at a cost of £20,000 from designs by Messrs. Austin & Paley, of Lancaster.

A new wing to St. Peter's School, York, was opened in June. The work was carried out from designs by Mr. Walter H. Brierley.

The foundation-stone of the new Royal Grammar School in Brandling Fields, Newcastle-on-Tyne, was laid on September 28th. Messrs. Russell & Cooper, of London, are the architects. The contract amounts to nearly £22,000.

A new grammar school at Marlborough was opened on September 6th. Messrs. Silcock & Reay were the architects.

Very satisfactory progress was made with the erection of the new technical college at Glasgow. Up to date the total expenditure has been about £170,000.

The New Naval College at Dartmouth. Sir Aston Webb, Architect.

Council Schools, Gillingham, Kent. J. Hatchard Smith, Architect.

Leeds Grammar School Extension. Austin and Paley, Architects.

Central Higher Grade School, Aberdeen. J. A. O. Allan, Architect.

South Wales and Monmouthshire University Buildings, Cardiff. W. D. Caröe, Architect.

The New Houses of Parliament, Stockholm. A. Johansson, Architect.

Main Facade with Monumental Entrance, Liege Exhibition.
Hasse and Soubre, Architects.

New Law Courts, Rome. Signor Calderini, Architect.

The New Cathedral at Berlin. Raschdorff, Architect.

The New City Hall at Cape Town.
Reid and Green, Architects.

SOME WORK ABROAD.

A new technical institute is being erected in College Square East, Belfast, from designs by Mr. Samuel Stevenson, and is expected to be finished by next June.

The work of erecting new elementary schools at Redhill, for the borough of Reigate, was carried on. Mr. John Moir Kennard, of London, is the architect, his design having been selected in competition.

New council schools in Llanishen Street, Cardiff, were completed at a total cost of £15,000. Messrs. Veall & Sant were the architects. Accommodation is provided for 400 boys, 400 girls and 400 infants.

A council school in Cowper Street, Leeds, accommodating 1,520 children, was opened in November. The cost was £31,200, Mr. Philip A. Robson being the architect.

New premises for the Working Men's College at Camden Town were built at a cost of £22,000 from designs by Mr. W. D. Caroe.

In October the foundation-stone of the new school in Dacre Road, Richmond (Surrey), was laid. The architect is Mr. E. J. Milner Allen, his design having been selected in competition. Messrs. Soole & Son are the builders, their contract being for £10,300.

At the South-Eastern College at Ramsgate, in October, the Archbishop of Canterbury

dedicated the John Deacon Memorial Tower. Mr. T. B. Whinney and Mr. W. Stock were the architects.

A new museum and zoology laboratories of Liverpool University, in Brownlow Street, were opened by the Earl of Onslow on November 18th. They cost £18,000. Messrs. Willink & Thicknesse were the architects.

New Buildings on the Continent and Abroad.

The new cathedral at Berlin was dedicated at the end of February, having been ten years building. It has cost £500,000 and represents the first Protestant Dom in modern Germany. The architect was Herr Raschdorff. The cathedral has a central cupola with cross reaching to a height of about 374ft.—which is nearly 79ft. less than St. Peter's, Rome, and more than 9ft. higher than St. Paul's. The total length of the building is 374ft. and the width nearly 80ft.

The houses of parliament at Stockholm were opened at the commencement of the year.

At Constantinople the British Hospital, designed by Mr. H. Percy Adams, F.R.I.B.A., was opened in January. The building has cost about £35,000 and accommodates fifty patients. It is built mainly of stone from Sevastopol, though Messrs. Doulton, of Lambeth, supplied much of the material for the building.

The huge new Catholic cathedral of St. Mary at Sydney, New South Wales, was dedicated in October. This building has cost £200,000.

The new façade to Naples Cathedral was completed. The total cost was £260,000.

At Rome the erection of the huge new law courts and the memorial to Victor Emmanuel was continued, though progress on both seems slow. The law courts, which face the Ponte Umberto I., were begun in 1889 and are estimated to cost £1,316,000, while the memorial, on the Capitoline Hill, was begun in 1885 and the cost down to the end of last year had been £750,000. Count Sacconi, the architect of the memorial, died in September, and three Italian architects, Piacentini, Koch and Manfredi, were appointed to carry on his work, which is still far from completion.

Cape Town's new municipal buildings were opened in August.

The new foundations for the rebuilding of St. Mark's Campanile at Venice were completed, these being carried on 3,076 larch piles and bonded into the old work which forms a nucleus in the centre.

A new theatre at Vienna, the Bürger-theater, was opened in December. The cost of the building was £79,000.

"Courier" Building, Dundee. Niven and Wigglesworth, Architects.

Frank Caws, F.R.I.B.A.

T. E. Knightley, F.R.I.B.A.

Thomas Blashill, F.R.I.B.A.

Obituary.

On August 22nd Mr. Alfred Waterhouse, R.A., died at his house at Yattendon, Berkshire. He was practically the last of the great Gothic Revivalists, and designed many important buildings. Chief among these is the Manchester Town Hall (remarkable for its planning), the Natural History Museum at South Kensington, the huge block of the Prudential Assurance Co. on Holborn, college work at Oxford and Cambridge, the National Liberal Club, Eaton Hall, Chester, and many other private houses and public buildings throughout the country. Mr. Waterhouse was 75 years of age.

Mr. Thomas Blashill, F.R.I.B.A., died on January 20th, aged 74, after a very brief illness. He was best known as having been superintending architect to the London County Council, in which capacity he was responsible for the erection of many important buildings in the Metropolis, including blocks of working-class dwellings on the Boundary Street area at Shoreditch, and other similar blocks at Millbank which have been carried out by his successor, Mr. W. E. Riley.

Mr. Frank Caws, F.R.I.B.A., of Sunderland, died in April, after an attack of pneumonia. He was in his sixtieth year. Besides being an architect of ability, he excelled in mathematics. For two years in succession he was president of the Northern Architectural Association. One of his designs was a pier at Seaview, and another a suspension bridge on the Wear at Stanhope, in both of which designs a novel principle was adopted so as to resist wind-pressure and give rigidity.

Lord Grimthorpe died in May. He was, of course, known to architects chiefly for his restoration of St. Albans Cathedral, and also as the designer of Big Ben.

Mr. James Thomson, F.R.I.B.A., I.A., of Messrs. Baird & Thomson, architects, Glasgow, died in February. He was born in 1835.

Mr. Charles Forster Hayward, F.R.I.B.A., architect and district surveyor, London, died on July 5th in his 75th year.

Mr. T. Denville Barry, well-known in Liverpool, died in March, in his ninetieth year. He was an architect of the Gothic Revival school.

M. S. J. Nicholl, A.R.I.B.A., died on March 21st in London, aged 78. He was a Catholic architect of ability.

Mr. John Leaning, the well-known London quantity surveyor, and author of the standard work on quantity surveying, as well as of other books of a similar nature, died in February, aged 65, following upon an operation for appendicitis.

Lord Grimthorpe.

Alfred Waterhouse, R.A., F.R.I.B.A.

Mr. James Mansergh, the well-known civil engineer, died in June, aged 71. He was much connected with railway and water works, and his great scheme for the conveyance of water from the Elan Valley (in Wales), to Birmingham was brought to a successful conclusion last year, when the King opened the works.

Mr. Joseph Wood, F.R.I.B.A., died on June 27th. He carried out a great deal of work at Bristol.

Mr. Cuthbert Brodrick died suddenly in March from pneumonia at his residence in Jersey, aged 83. His chief work was the Leeds Town Hall, which is still recognized as a very fine building.

Mr. A. W. Mills, architect of the Manchester Exchange, the London Road Station and other buildings at Manchester, died on November 22nd, aged 92.

Mr. David Ross, M.I.C.E., formerly engineer to the Corporation of the City of London, died in November, aged 60.

Mr. T. E. Knightley, F.R.I.B.A., of London, died in September, aged 82. He was the architect of the Queen's Hall and the Birkbeck Bank.

Mr. H. H. Collins, F.R.I.B.A., of London, died on December 13th in his seventy-third year. He built a number of City offices and warehouses and was district surveyor for the eastern division of the City.

Mr. Moss Settle, A.R.I.B.A., of Barrow and Ulverston, died on December 13th, aged 29.

Mr. H. H. Armstead, R.A., the well-known sculptor, died in December, aged 79. His two most important works were the sculptured decorations on the Colonial Office in Whitehall and the southern and eastern sides of the podium of the Albert Memorial. He also did the marble reredos in Westminster Abbey and the fountain in front of King's College, Cambridge. "His work had monumental character and simplicity, and will always be remembered as belonging to the front rank of British sculpture."

Colonel Bird, one of the founders of the London Institute of Builders, died in April.

Board of Architectural Education.

The new Board of Architectural Education, after long deliberation, issued a report which was approved by the council of the Institute and by the educational bodies interested, and the co-ordination of the work in the various universities and leading schools throughout the country is now agreed upon. The scheme has not yet come into actual operation, but when it does it is thought that the Board's certificate will form a very valuable asset in the portfolio of the rising architect.

Report of the Lightning Research Committee.

The report of the Lightning Research Committee was issued in May. The committee summarized in it their four years' work, and included suggestions and results based on reports of damaged buildings in 115 cases of lightning stroke; forty of these buildings were provided with lightning rods. The various cases noted by the committee show that while even a single conductor tends to diminish the damage done to buildings by lightning, no reliance can be placed on the area of protection.

New Theory about Masonry Dams.

A new theory about masonry dams was put forward in March by Mr. Atherley and Mr. Pearson, both of University College, London. Briefly stated, the theory is that vertical sections of a dam under water-pressure are more severely strained than the horizontal sections, and that while a dam designed under the rules hitherto applied may be safe as regards cracking horizontally, it may nevertheless be liable to do so vertically.

All Saints' Church (Perceval Memorial), Ealing.
William A. Pite, Architect.

The Church of St. Chad, Longsdon, Staffs. Gerald C. Horsley, Architect.

New Chancel, Downside Abbey, Bath. Thomas Garner, Architect.

Churches.

The Bishop Walsham How Memorial at Wakefield Cathedral, consisting of an addition to the choir, designed by the late Mr. Pearson, R.A., and completed under the superintendence of his son, Mr. Frank Pearson, was consecrated on Easter Tuesday. The total cost was £50,000.

The new choir and chancel of Downside Abbey, near Bath, were blessed on September 18th. The work has been carried out from designs by Mr. Thomas Garner at a cost of nearly £17,000 by local masons working under Dom Philip Whiteside, Procurator and Bursar of the Abbey.

The church of St. Erkenwald at Southend was dedicated at the end of September. It accommodates 800 worshippers, and when complete will have cost £15,000. The tower, however, has not yet been built. Mr. Walter J. Tapper is the architect.

At Ealing Common the new church of All Saints was erected to the memory of the Right Hon. Spencer Perceval, Prime Minister of England, who was assassinated on leaving the House of Commons in 1812. The church was consecrated by the Bishop of London in November. Mr. W. A. Pite, F.R.I.B.A., was the architect.

At St. John's Church, Wakefield (built in the last decade of the eighteenth century), the work of rearrangement and adaptation to modern use, begun in 1884, was carried on, under the direction of Mr. J. T. Mickethwaite, and the new chancel is to be consecrated to-day.

The Church of St. Chad at Longsdon, Staffs., was completed in September and consecrated by the Bishop of Lichfield on October 5th. It is situated about two miles from Leek, in North Staffordshire, and is built of local stone. Mr. Gerald C. Horsley, of London, was the architect.

The Savoy Chapel was re-decorated and lightened inside by order of the King. The work was done by Messrs. Clayton & Bell.

New Chancel and Choir, Downside Abbey.

New Chancel, Chapel and Vestries, St. John's Church,
Richmond, Surrey. Arthur Grove, Architect.

Cockington Church, near Torquay, was completed from designs by Messrs. Nicholson & Corlette, according to whose designs also the additions at All Souls' Church, Loudoun Road, Hampstead, were erected. St. Alban's Church, Southend, was also completed from their designs.

At St. Michael's Church, Headingley, Leeds, a new reredos by Mr. Temple Moore was dedicated on December 14th.

Beth Hamedrash—primarily intended for the study of Holy Law, but actually the Jewish ecclesiastical court—was opened in December. It is in Mulberry Street, Commercial Road, London, E.

On November 11th the Bishop of Ripon consecrated the new Church of the Holy Spirit at Beeston Hill, Leeds, built from designs by Mr. Prothero at a cost of £11,000.

All Saints' Church, Hertford, was completed. The total cost, including the portion carried out in 1893, was £28,000. Messrs. Austin & Paley were the architects.

A Jesuit Fathers' Church at Wimbledon was built at a cost of £6,500. Mr. F. A. Walters was the architect.

New buildings at Lyndhurst Road Congregational Church, Hampstead, were built from designs by Messrs. Spalding & Spalding at a cost of £10,000.

A new church was built at Catford from designs by Mr. Philip A. Robson, A.R.I.B.A.

Christ Church, Moss Side, Manchester, was built from designs by Mr. W. Cecil Hardisty.

The restoration of the fine fifteenth-century church of St. Columb Major, Cornwall, was completed under the direction of Mr. G. H. Fellowes Prynn.

The restoration of the church of St. Bartholomew-the-Great, Smithfield, which has been carried out by Sir Aston Webb, R.A., reached its final stage when on December 2nd the Bishop of London reopened and dedicated three bays of the east cloister—once used as a stable.

Cathedrals and Abbeys.

Throughout the year the foundation work of Liverpool Cathedral has been carried on without intermission, and in November Mr. Gilbert Scott, the architect, was able to announce to the cathedral committee that the foundations would be completed by March 1st next, when the building of the cathedral proper will be proceeded with. About 180 men have been regularly employed. The foundations for the great twin towers, which will be 275ft. high, each comprise four piers 32ft. square at the base and tapering to 16ft. square at the top. They have been carried down to an average depth of 43ft. to the rock.

At the beginning of the year alarmist reports about the safety of St. Paul's Cathedral were circulated, though, as a matter of fact, there was nothing to occasion unnecessary anxiety. A fissure in the southern transept undoubtedly exists, and various other portions of the building have needed attention. During the year considerable advance has been made with the work of repair under the direction of the cathedral architect, Mr. Somers Clarke, who has taken down the whole of the vault over the west portico and rebuilt it. St. Paul's has also been the subject of special attention by reason of

Additions to All Souls Church, Hampstead.
Nicholson and Corlette, Architects.

the opening of a new chapel dedicated to the Knights of the Order of St. Michael and St. George, at the south-western end of the building, where Alfred Stevens's Wellington memorial formerly stood.

Serious dilapidations at Winchester Cathedral were discovered, and it was found imperative to shore up the walls at the east end to prevent a collapse. Mr. T. G. Jackson, R.A., and Mr. Francis Fox, the eminent engineer, were called in to consult with Mr. J. B. Colson, surveyor to the cathedral. Underpinning is to be carried out, and the aisle roofs renewed. The west front, too, requires immediate attention.

The massive tower pinnacles of Bath Abbey, one of which was struck by lightning, were taken down and are to be re-erected on a smaller scale. Mr. T. G. Jackson, R.A., is the architect in charge.

At Tintern Abbey a considerable amount of repair work was carried out under the supervision of the architect for the Crown, Mr. F. W. Waller. Most important was the re-setting of the stonework in the great east window, which had got into a dangerous state. Some pieces of the main tracery which had fallen were found, and it was thus possible to complete the large ring in the head of the window, and at the same time add to the stability of the whole.

Many lengthy letters appeared in the Scottish press in regard to the restoration of

Wakefield Cathedral Extension.
The late J. L. Pearson, R.A., Architect.

Rood Screen, St. Alban's Church, Southend-on-Sea.
Nicholson & Corlette, Architects.

Iona Cathedral, showing North Transept. John Honeyman, Architect.

Iona Cathedral, which has been carried out under the direction of Mr. J. Honeyman, of Glasgow. It was urged that the restoration was not needed, and that the work which had been carried out was unsatisfactory, the carving being inferior and the roof varying in colour. Mr. Honeyman replied to the charges, and there the matter ended. For the present, work is stopped for want of funds. The choir, south aisle, south transept and tower were roofed nearly four years ago, but

it was only this summer that the building was enclosed and made fit for use by the completion of the north transept, the gable of which had been demolished some considerable time ago and had since stood roofless. The gable was rebuilt in the same plain style which was so markedly characteristic of the old buildings.

Mr. Somers Clarke reported that £5,000 would be needed to carry out repairs and restorations at Chichester Cathedral, where the bell tower and roof call for most urgent attention.

Considerable discussion took place in reference to the rebuilding of the flying buttresses on the south side of the nave of York Minster. Mr. Bodley, the architect, however, showed that buttresses had originally existed complete—seven old prints in the Minster library represent them so—but they were suffered to get out of repair and were partially or entirely pulled down at a time when church architecture was at its lowest ebb. He also showed that although the nave is not stone-vaulted, having a timber roof, it was a fact that the roof was pushing out the clearstory walls, so that flying buttresses were indispensable.

J. T. Micklethwaite and Somers Clarke, Architects.

Rural By-Laws.

Rural by-laws were the subject of much public discussion, though nothing was done during the year to put the matter on a really satisfactory basis. In May, however, the Public Health Act Amendment Bill was read a second time in the House of Lords and referred to a select committee. This Bill is a step in the right direction of securing more reasonable by-laws for rural districts. The need for such by-laws was instanced by numerous cases throughout the year.

Exploration and Discovery.

Early in the year what was characterized as the greatest discovery ever made in Egypt was announced. This was the tomb of Yua and Thua found by Mr. Theodore M. Davis in the Valley of the Tombs of the Kings. It had not been touched since the 18th Dynasty (about 4,000 years ago) and was filled with articles of decoration; chairs, boxes, and a chariot in the most excellent state of preservation—all covered with gold.

At Knossos, in Crete, Dr. Evans traced the paved Minoan way leading from the wonderful palace to the hillside opposite, and here discovered a "little palace" reproducing in its general style and arrangement the larger one to the east. A wholly new type of Mycenaean column was found, with fluting in relief.

Kingsweston Estate Offices, near Bristol. F. Bligh Bond, Architect.

Central Hall, Eccles. Edward Hewitt, Architect.

The Proposed County Hall for London. Drawing of Sketch Design by Hedley Fitton.

Town Hall and Municipal Buildings.

The subject of a new county hall for London came up for general discussion in the early part of the year, and at last, in April, the Establishment Committee brought forward a suggestion to acquire a site just below Westminster Bridge, on the southern bank of the Thames. This the Council adopted, deciding to spend £600,000 on the site, £1,056,000 on the building, and £44,000 on the formation of an embankment in front, a total of nearly one and three-quarter millions. For this proposed huge building the Council's architect, Mr. W. E. Riley, prepared a sketch design (shown by Mr. Hedley Fitton's drawing above, which originally appeared in the "Pall Mall Magazine" some months ago), but it seems probable that the work will be the subject of a large open competition. Prior to the decision about the site being arrived at, a scheme for building a county hall on a new bridge across the Thames, at Arundel Street, was put forward by Mr. A. R. Bennett.

Deptford's new town hall was opened in July. The design, by Messrs. Lanchester & Rickards, was the outcome of a competition. The total cost of the building has been about £50,000.

The new municipal buildings at Walsall were opened on September 27th. The cost was £101,000. Mr. J. S. Gibson, F.R.I.B.A., was the architect.

New municipal buildings at Tottenham were opened in November. They have cost £70,000, the architects being Messrs. Arnold S. Tayler & A. R. Jemmett.

A scheme for municipal buildings, law courts and town hall at Bournemouth was

adopted by the town council. This has been prepared by Mr. F. W. Lacey, C.E., F.R.I.B.A., borough engineer of Bournemouth, and Mr. C. E. Mallows, F.R.I.B.A., of London, and is estimated to cost altogether £126,000. The law courts occupy the right-hand wing, the municipal buildings the left-hand wing, and the town hall the back of the site.

The new municipal buildings at Crewe were opened in July. They occupy a site adjoining the market hall in Earle Street, and have cost about £20,000. Mr. Henry T. Hare was the architect.

On May 24th the foundation-stone of the new town hall at Sutton Coldfield was laid. This building is to cost £10,000. The architect is Mr. Arthur R. Mayston, of London.

On July 28th the foundation-stone of the Bradford Town Hall extension was laid. This work is being carried out from designs by Mr. F. E. P. Edwards, the city architect, in consultation with Mr. R. Norman Shaw, R.A.

At Aberdeen the plans prepared by the burgh surveyor for the reconstruction of the town house, at an estimated cost of £100,000, were discussed.

Work on the huge new city hall at Belfast, which is to cost £350,000, was proceeded with steadily, more especially in the decoration of the interior, where rich marbles have been used profusely. Mr. A. Brumwell Thomas, F.R.I.B.A., of London, is the architect.

New municipal buildings at South Shields were opened on September 27th. Mr. E. E. Fetch was the architect. The cost was £48,000.

Kingsway and Aldwych.

Kingsway, the great new thoroughfare leading from Holborn to the Strand, and its crescent, Aldwych, were formally opened by the King on October 18th. The estimated gross cost of the improvement is nearly £5,000,000, and the estimated recoupment a little over £4,000,000, thus reducing the nett cost to £750,000. Mr. Maurice Fitzmaurice, engineer to the London County Council, had charge of the work.

Institute Affairs.

In his presidential address in November Mr. Belcher announced the proposal to acquire a freehold site in Portland Place for a new home for the Institute. Subsequently a memorial signed by Fellows and Associates was presented asking that the building might be the subject of an open competition.

In May, at a meeting of local Associates of the Institute held at Leeds, a protest was made against the practice of direct election to the Fellowship without the candidate being required to pass any examination. This protest received support in many other provincial quarters. In reply, the Institute stated it was not fair or politic to call suddenly upon architects between thirty and forty years of age, in the full tide of busy practice, to pass an examination, or otherwise be excluded for ever from the Institute.

The annual dinner was held at Newcastle in October, and visits were paid to places in and around the town.

A group of able architects, including Mr. Mervyn Macartney, who had left the Institute or never been members of it, agreed to join hands with it, in view of the requirements and arrangements for architectural education.

Registration.

In July the Institute Registration Bill—or, as it is called, the Bill for the Statutory Enrolment of Architects—was issued. There were no startling proposals in it, but a number of points hitherto in doubt were defined. It was proposed to come into force on July 1st, 1907, and a committee is at present appointed to take evidence on the matter. Though the council elections were quite against the old registrationists it was significant to note that Mr. Belcher in his presidential address to the Institute in November said that though considerable diversity of opinion still existed, and it was scarcely possible that the Bill should pass into law, "yet some remedy must be found for the present evils; we cannot be indifferent to the interests of the many able men upon whom existing conditions press so hard."

It is hoped to call a special meeting of the Institute early in the new year to receive the report on registration drawn up by the council and the registration committee.

New Tramway Offices, Hatton Garden, Liverpool.
Thomas Shelmerdine, Corporation Architect and Surveyor.

The Waldorf Theatre, Aldwych, London.
W. G. R. Sprague, Architect.

New Offices for "Country Life," Tavistock Street, Covent Garden, London. E. L. Lutyens, Architect.

New Buildings for Co-Operative Wholesale Society, Ltd., at Broad Quay, Bristol. F. E. L. Harris, Architect.

New Premises, Oxford Street, London, for Waring & Gillow, Ltd. R. Frank Atkinson, Architect.

New Premises for Edinburgh Life Assurance Co., St. Vincent Street, Glasgow. John A. Campbell, Architect.

Business Premises.

The new block of shipping offices for the Red Star, White Star and other lines was completed before the summer on a prominent site in Cockspur Street, facing down Pall Mall, London. The architect was Mr. Henry Tanner, junior, A.R.I.B.A., of London, and the contractors were the Waring White Building Co., Ltd.

The huge new premises for Messrs. Waring & Gillow, Ltd., in Oxford Street, London, were erected, so far as the outside is concerned, and work on the interior well advanced. The architect is Mr. R. Frank Atkinson, F.R.I.B.A.

New business premises on High Holborn, facing the Holborn Restaurant, were completed from designs by Mr. H. Percy Adams.

Baltic House, Leadenhall Street, London, was completed early in the year for the City Offices Co. This is a very large office building. The architects were Messrs. Gordon & Gunton and the builders Messrs. Patman & Fotheringham, Ltd.

New premises at Broad Quay, Bristol, for the Co-Operative Wholesale Society, Ltd., were erected from designs by Mr. F. E. L. Harris, A.R.I.B.A., of Manchester.

New premises for the Edinburgh Life Assurance Co., at 122 and 128, St. Vincent Street, Glasgow, were erected from designs by Mr. John A. Campbell. The front is of white freestone, with steel framework,

columns being encased in brickwork and beams in concrete.

A block of offices for the Bennett Steamship Co. in Tooley Street, London, S.E., was built from designs by Mr. Stanley D. Adshead.

New offices for the Sanitas Co., Ltd., were erected in Locksley Street, Limehouse, E. Mr. Arthur T. Bolton was the architect.

At Liverpool substantial progress was made with the erection of the huge new offices for the Mersey Docks and Harbour Board on the site of St. George's Dock.

At Sunderland a new building for the York City and County Bank was erected in Fawcett Street, Mr. Walter H. Brierley being the architect.

New head offices for the State Fire Insurance Co. in Dale Street, Liverpool, were erected from designs by Mr. W. Aubrey Thomas. They were opened in June.

Colonial House, Liverpool, the large block of new offices for Messrs. Elder, Dempster & Co. at the corner of Water Street and Tower Gardens, was completed and opened.

New premises for the Phoenix Insurance Co., in South Parade, Leeds, were erected from designs by Mr. William H. Thorp.

New premises for the Professional and Civil Service Supply Association, Ltd., at 80, George Street, Edinburgh were erected, Messrs. John Burnet & Son being the archi-

itects. At Edinburgh, too, new offices of the North British and Mercantile Insurance Co. were erected in Princes Street, from designs by Messrs. Peddie & Washington-Browne, who were also the architects for the British Linen Co.'s new bank in George Street.

A new factory for the manufacture of spirit varnish and the bleaching of shellac was built at Brimsdown, Middlesex, from designs by Mr. H. P. Burke Downing.

At Bristol new premises for the London and Lancashire Fire Insurance Co. were built from designs by Mr. Edward Gabriel, of London.

New offices for Messrs. Fairweather & Sons, tobacco manufacturers, were erected in the new Seagate, Dundee, at a cost of £7,000, Messrs. Charles Ower & Co., of Dundee, being the architects. Reinforced concrete was used for the foundations. Behind the offices are the firm's works, which are among the most complete in Scotland.

At Bristol new offices for the Phoenix Insurance Co. in Clare Street were completed at a cost of about £5,000. The design accords with some of the older eighteenth-century Bristol houses, now past and gone, of which the deeply-projecting cornices and window pediments were striking features. In the Phoenix building the rustication of the lower part is made to represent curling tongues of flame. Mr. F. Bligh Bond, F.R.I.B.A., of Bristol, was the architect.

The Ritz Hotel, Piccadilly, London.
Mewes and Davis and John P. Bishop, Architects.

A unique building in Basnett Street, Liverpool, is being erected by Messrs. E. F. Blakeley & Co., constructional engineers, of Vauxhall Ironworks, Liverpool. This is the premises of Messrs. George Henry Lee & Co., Ltd., silk mercers and general drapers. The whole of the front and one end are to be built exclusively of ironwork, with highly decorated cast pilasters; steel framework being used for the window frames—no masonry appearing whatever. Messrs. Matear & Simon are the architects, and Mr. Henry Woodhouse is the engineer for the work. New works at Ellesmere Port were designed and erected by Messrs. Blakeley for the Wolverhampton Corrugated Iron Co., Ltd.

Hotels and Restaurants.

The Ritz Hotel in Piccadilly, London, was brought well on to completion. It is to be finished for the next season—about March, 1906. The contractors are the Waring White Building Co., Ltd.

The new Gaiety Hotel in the Strand, erected from designs by Mr. R. Norman Shaw and Messrs. Runtz & Ford, was opened in May. The contractor was Mr. Carmichael. The building is of Portland stone, and the cornice, at a height of 80ft., is the largest in London. The chief features of the interior are the restaurant (over which is the ball-room), the Adam banqueting hall, the masonic temple and the Dutch buffet.

Early in the year the design was published for the new hotel which is to be erected in Piccadilly from designs by Messrs. William Woodward and Walter Emden. The site is that formerly occupied by St. James's Hall and Restaurant, which block was demolished,

Gaiety Restaurant, London. Runtz and Ford, Architects.

Gaiety Hotel and Theatre, Strand, London.
Runtz and Ford and R. Norman Shaw, Architects.

the well-known organ of the hall going to the new town hall at High Wycombe. The hotel will have a frontage also in Regent Street Quadrant, and considerable disquietude among architects was evinced in regard to this. Fortunately, the aid of Mr. Norman Shaw, R.A., was secured by the Crown (who are the ground landlords), and it is hoped that nothing will be done to destroy the present harmony of the Quadrant.

Frascati's Restaurant was re-decorated and enlarged under the direction of Mr. Charles H. Worley, F.R.I.B.A. A masonic temple is now included in the building.

In the south-west of London, at Stockwell,

Ingram House, Stockwell, London: End of Library Wing. Arthur T. Bolton, Architect.

Ingram House, the residential club for young men, was completed and opened in November. The plan is that of a St. Andrew's cross. There are four floors of bedrooms above two floors of social rooms, accommodating 208 residents. Mr. Arthur T. Bolton was the architect.

The Peebles Hydropathic was destroyed by fire, and a new design for the rebuilding was prepared by Mr. James Miller, of Glasgow, estimated to cost about £35,000.

Matear and Simon, Architects. Steelwork by E. F. Blakeley & Co.

Business Items.

Messrs. Orenstein & Koppel amalgamated with Mr. Arthur Koppel. The total paid-up capital of the two firms is £1,100,000.

Wallpaper Manufacturers, Ltd., made a profit of £243,227, and declared a dividend of 8 per cent. on their ordinary shares. They also purchased the Lincrusta business of Messrs. Frederick Walton & Co., Ltd.

The Bath Stone Firms, Ltd., paid an interim dividend of 14 per cent. per annum, having made a nett profit of £18,509 for the half year ended June 30th last.

Messrs. R. Neill & Sons, builders and contractors, of Manchester and Newcastle, secured the contract (£150,000) for the widening of the L. & N.W. railway at London Road, Manchester.

Messrs. James Crispin & Sons erected heating, ventilating and hot-water supply apparatus at the new art gallery at Bristol.

The Well Fire Co., Ltd., of Darlington, supplied more than sixty of their fires for the new town hall at Walsall and also for the cheap cottages exhibition at Letchworth, and the new schools for University College at Hampstead.

The Columbian Fireproofing Co., Ltd., executed the whole of the fireproof flooring at the Ritz Hotel in Piccadilly, Waring & Gillow's new premises in Oxford Street, the new offices of the Shipping Combine in Cockspur Street, and at many other important buildings.

Mr. Robert Adams, of 3 and 5, Emerald Street, Holborn, W.C., supplied his patent fittings to a number of important buildings, among them being the new War Office.

New Towns.

Outside Bristol has been springing-up the township of Avonmouth, now a place of much possibility by reason of the docks in progress there and the making of it a place of call for the American and African trading steamers of Messrs. Elder, Dempster & Co. Practically all the land—known as the Kingsweston estate—is owned by Mr. Philip Napier Miles, J.P., who has laid out a series of fine roads, and it is his intention that the new township shall be controlled on architectural lines. To this end he has appointed Mr. F. Bligh Bond, F.R.I.B.A., of Bristol, consulting architect for all work on the estate. A large number of artisans' dwellings and shops have been erected, together with a few buildings of public character. Among the latter are the Kingsweston Estate Offices (see p. 19) completed this year from Mr. Bond's design.

Late in the year Mr. John Cory's scheme for laying out a garden city at Peterston, near Cardiff, was made public. On a site of about 200 acres the city is proposed to be developed on a circular plan, with a green in the centre, each house being allotted about one-sixth of an acre. The architect in charge of the work is Mr. W. Beddoe Rees, of Cardiff. A scheme is being prepared by which 80 or 85 per cent. of the money to build houses will be provided on security of the lease.

Prizes and Studentships.

The designs sent in for the prizes and studentships offered by the Royal Institute of British Architects were this year of very fair merit. The subjects of the Soane and Tite were perhaps somewhat too elaborate, the former being a royal palace, for which Mr. S. Herbert Maw, of Bolton, was successful, and the latter a hotel lounge and staircase, for which Mr. Robert Atkinson, of Nottingham, was successful. The essay medal was won by Miss Ethel M. Charles, A.R.I.B.A., of London; the measured drawings prize by Mr. E. G. Wylie, of Glasgow; the Pugin by Mr. E. Garrett; the Arthur Cates by Mr. F. Winton Newman; and the Grissell by Mr. J. A. M. Hunter, of Aberdeen.

At the Royal Academy Mr. Leslie Wilkinson, for the second year in succession, won the gold medal and travelling studentship (value £200) by his design for a British embassy in a foreign capital.

Soane Medallion Design for a Royal Palace, by S. H. Maw.

Tite Prize Design for Hotel Lounge and Staircase, by Robert Atkinson.

Grissell Prize Design for a Winter Garden, by J. A. M. Hunter.

£150 Cottage, Class 1, First Prize (£100).
Percy B. Houfton, Architect.

£100 Prize for the Cheapest Cottage. A. H. Clough.

Cottage, Class 4, First Prize (£100).
A. Randall Wells, Architect.

Group of Four Cottages, Class 3, First Prize (£25). Geoffrey Lucas, Architect.

Wooden Cottage, First Prize (£50).
F. W. Troup, Architect.

Cheap Cottages Exhibition.

From July to September an exhibition of cheap cottages, arranged by the "County Gentleman," was held at Letchworth (Garden City), Hertfordshire, by favour of the Garden City Company. The exhibition was primarily intended to demonstrate the possibility of erecting suitable cottages for agricultural labourers at a cost of not more than £150. The conditions of the competition, however, were such that this object was not fulfilled, and the cottages generally cost more than that sum. The first prize for a cottage to cost not more than £150 was awarded to

Messrs. Green Brothers, of Whittington, near Chesterfield, Mr. Percy Houfton, of Chesterfield being the architect. The second prize in this class (of £50) was awarded to Messrs. Bennett and Bidwell, of Letchworth. Both of these cottages were of brick. The third prize of £25 was secured by Messrs. Potter & Co., of 66, Victoria Street, S.W., for a concrete *in situ* bungalow. The prize of £100 offered for the cheapest cottage in the exhibition was secured by Mr. A. H. Clough, of Burley, Ringwood, this being also a brick cottage. The first prize for a wooden cottage was awarded to Mr. F. W. Troup, of London; and the first prize for a pair of cottages (cost not to exceed £300) to Messrs. Potter & Co., the construction in this latter being plaster on expanded metal. In the third class, for a group of three or four cottages (cost not to exceed £35 per room), the prize was won by Mr. Geoffrey Lucas, of London and Hitchin; and in class 4, for a detached cottage (cost not to exceed £35 per room), Mr. A. Randall Wells, of

Prize Cottage of Concrete Blocks, by Concrete Machinery Co. Gilbert Fraser, Architect.

Hastings, won the prize of £100. A special prize for a cottage built of concrete was awarded to the Concrete Machinery Co., of Liverpool (Mr. Gilbert Fraser, architect). The result of the exhibition goes to show that under the conditions that prevailed at Letchworth brick cottages can be erected as cheaply as those of timber and most patent materials.

Colshaw Hall, Cheshire: Garden and Entrance Fronts.
Douglas and Minshull, Architects.

Cottage at Chislehurst. E. J. May, Architect.

Personal.

At the end of February a complimentary dinner was given to Mr. R. Phené Spiers at Pagini's Restaurant, when an address was

R. Phené Spiers.

presented to him in testimony of his abilities. Sir Aston Webb presided.

At the end of January the elections to fill the three vacancies in the ranks of the Royal Academicians took place, and

Reginald Blomfield, A.R.A.

Mr. Reginald Blomfield gained his fauteuil among the architect Academicians. The elections were made from a list of 93 painter candidates, 17 sculptors and 39 architects. Among the last named, however, there was only one new candidate—Sir William Emerson.

A. E. Pridmore, President of the Society of Architects.

Mr. A. E. Pridmore was elected president of the Society of Architects.

Among the foremost firms of English contractors are Messrs. Patman & Fotheringham, Ltd., noted especially for the speed with which they accomplish large works, a point upon which great insistence is nowadays placed. The firm have been largely engaged in the erection of theatres, and their work at the London Coliseum recently brought them into prominence. Their experience in this direction was especially valuable in connection with the repair work necessitated by the crack discovered in the proscenium arch of His Majesty's Theatre, Haymarket, London, which caused somewhat of a scare and forced Mr. Tree to suddenly close the house. This work was performed in the extremely quick time of two weeks. Messrs. Patman & Fotheringham, of which Mr. James F. Parker is managing director, have also carried out during the year Messrs. Pawson & Leaf's new premises in St. Paul's Churchyard, and were engaged on the reconstruction of the Avenue Theatre, which was ruined by the terrible collapse of Charing Cross Station roof on December 5th.

Another of our foremost builders is Mr. Howell J. Williams, who has had a good deal of work in hand this year, especially in the direction of commercial offices. Mr. Williams is a member of the council of the London Master-Builders' Association. His firm, Howell J. Williams, Ltd., have erected new premises in Fetter Lane and Norwich Street for Messrs. Harrild & Sons, printers' machinery and roller manufacturers; new banking premises in Fenchurch Street, E.C., for Messrs. Kleinwort; the east block for the northern district post-office at Islington; extensions and alterations to the London Fever Hospital in Liverpool Road; and Messrs. Spottiswoode & Co.'s new printing premises in New Street Square, E.C. Mr. Williams can claim a considerable experience in the erection of printing premises. The most notable building of this kind which he has erected is the "Daily Mail" and "Evening News" printing and publishing block in Carmelite Street.

At the annual dinner of the London Master-Builders' Association held in February Mr. J. Howard Colls was presented with the portrait of himself painted by Mr. Orchardson. The portrait was hung in this year's Academy.

Sir Caspar Purdon Clarke, C.I.E., F.R.I.B.A., resigned his office of Director of the Victoria and Albert Museum, South Kensington, after twenty-five years' service, and went to New York as Director of the Metropolitan Museum of Fine Arts.

Mr. John Belcher, A.R.A., was entertained at dinner in April by his past and present staff, in honour of his election as president of the R.I.B.A.

Professor Beresford Pite was appointed director of architectural instruction and lecturer on architectural subjects at the L.C.C. School of Building at Brixton.

The Royal Gold Medallist.

The Royal Gold Medal this year was awarded to Sir Aston Webb, R.A., well-known for his numerous important buildings, including the Birmingham Law Courts, the new Bluecoat School at Horsham, the new Naval College at Dartmouth, the completion of the South Kensington Museum, the Royal College of Science (opposite the Imperial Institute), the National Memorial to Queen Victoria and the restoration of St. Bartholomew's. At the Academy he exhibited his treatment for the triumphal arch which is to be erected at the end of the Mall leading into Trafalgar Square. This is likely to have a very dignified appearance when erected.

The Waring White Building Co., Ltd., are a new firm of contractors who have made great strides in the past year towards obtaining a foremost place, having secured a number

R. A. Denell, Managing Director, Waring White Building Co., Ltd.

of important contracts. The company was started by Messrs. Waring, the well-known furnishing firm (who also have their building department), and Messrs. J. G. White & Co., Ltd., the large contractors for tramways and other engineering works. It is the expressed intention of this firm to combine the best English and American methods of

James F. Parker, Managing Director, Patman and Fotheringham, Ltd.

erecting buildings. Their part in the erection of the Ritz Hotel, a steel frame construction, has brought them prominently before the public. The managing director is Mr. R. A. Denell, a licensed architect of the United States, who has had much experience, especially with Messrs. D. H. Burnham & Co., one of the largest firms of architects in

Howell J. Williams, Managing Director, Howell J. Williams, Ltd.

America, and perhaps the originators of the American office building. Mr. Denell recently read a paper before the R.I.B.A. upon the subject of American methods of erecting buildings in which he gave much valuable information.

New Sea-defence Works and Marine Parade, Blackpool.
John S. Brodie, Borough Engineer.

Engineering Works.

Blackpool's new sea defence works and marine promenades, after occupying nearly three years in construction at a cost of little short of £450,000, were completed by the end of July. The new works extend from the south shore to the north pier. The central and southern sea-defence works and promenades were commenced in May, 1903, and completed as far as the north pier in June last. The area reclaimed from the seashore is 22 acres. Between the sea and the buildings fronting are an easterly footway 15ft to 30ft. wide, a new carriage drive 40ft. wide, an island footway 10ft. wide, a tramway track 17ft. 6ins. to 20ft. 6ins. wide, while the average width of the broad westerly footway or parade is 80ft. There are also, leading to the foreshore or sands, thirty-five flights of steps 15ft. wide, and six roadways 30ft. wide. The engineer for the work was Mr. John S. Brodie, A.M.I.C.E., borough engineer and surveyor for Blackpool.

The new pier at Falmouth was completed, after two years' work, at a cost of £7,000. It is 310ft. long, the portion nearest the town being granite work, and the rest, for a length of 200ft., constructed on the Hennebique system of reinforced concrete.

A new lighthouse on the extremity of Portland Bill was completed.

Bridges, New and Old.

Considerable discussion throughout the year centred round the old Bridge of Ayr, which for some time has been in a very unsatisfactory condition. The proposal of the town council was first to pull down the old structure and erect a new bridge, but considerable opposition was raised to this, and in the end, after reports by various well-known engineers and architects, the town council in October granted four months' respite to enable the objectors to show how the old bridge could be preserved and at the same time repaired sufficiently to keep it stable.

The transporter bridge across the Mersey at Runcorn was opened in May. It has cost £130,000, and is on the same principle as that at Newport, Mon., namely, with the car suspended by guys from an electrically-driven trolley running across the main girder of the bridge.

The work of erecting the superstructure of the new Vauxhall Bridge was proceeded with, the huge steel spans being put in place, but it is not likely that the bridge will be completed before next March. Its total cost is expected to be nearly £400,000.

At Exeter the old stone bridge over the river was replaced by a one-span steel bridge built at a cost of £25,000 from designs by Sir John Wolfe Barry and Mr. C. A. Brereton. The new bridge was opened in April.

The great steel bridge over the gorge of the Victoria Falls, South Africa, was completed in April. The floor of the bridge is at a height of 400ft. above the water—the highest in the world.

After having wasted £900 in taking away the fine old bronze lamps which stood on the parapets of Waterloo Bridge, and replacing them with some spidery electric-light standards, the London County Council decided in July to replace the old lamps at an additional cost of £600.

The Stoneferry Bridge across the River Hull, about two miles from the Humber, was opened on October 16th. It is a steel swing bridge and cost £20,000. It was designed by the city engineer, Mr. A. E. White.

Miscellaneous.

The sixth International Building Trades' Exhibition was held in April at the Royal Agricultural Hall, Islington, and proved a great success. There were about 300 separate exhibitors.

In April the Egyptian Hall in Piccadilly was pulled down. It was erected in 1812, at a cost of £16,000, for a natural history museum.

At No. 47, Brook Street West, London, a reproduction of the Palace of Artaxerxes at Susa was carried out for Mr. Bland-Sutton as a dining-room 40ft. square. It was executed by Mr. F. Arthur under the direction of Mr. Herbert E. Wheeler, of London. The columns are in scagliola and the friezes in enamelled brick.

A large chimney was built at the Birmingham Corporation electricity station in Sumner Lane. It is 250ft. high and 24ft. external diameter at the bottom, tapering to 17ft. 4ins. at the top; weight 2,750 tons. This is the largest chimney in Birmingham.

No. 17, Fleet Street, London, upon the acquisition and restoration of which the London County Council (after much discussion and many delays) decided to spend £27,000, was taken in hand, and the portions of the old front exposed. The result, however, can hardly be called satisfactory.

No. 17, Fleet Street, London, as Restored by W. E. Riley, Superintending Architect, L.C.C.

New Bridge at Exeter. Sir John Wolfe Barry and C. A. Brereton, Engineers.

The Auld Brig of Ayr.

At Sheffield the new front of the Midland passenger station was completed.

At Edinburgh the exhibition of "architectural refinements" in mediæval buildings, organized by Mr. Henry Goodyear, of Brooklyn, and held under the auspices of the Edinburgh Architectural Association, was opened by the Earl of Wemyss on September 6th.

Watts's famous equestrian figure of "Physical Energy" was removed from the quadrangle of Burlington House, and shipped to South Africa, where it will be erected, not on the Matoppos as originally intended, but at Groot Schuur, the Cape Town residence of the late Mr. Cecil Rhodes.

An archæological congress was held at Athens in April.

The most important scheme brought forward in Manchester for many years was presented to the City Council in October. This is for the rebuilding of about twenty-five acres between Oldham Street, Victoria Street, Market Street and Cannon Street. The total estimated cost is £1,300,000, but the nett cost is put at £250,000. The proposal is not yet settled.

The Usher Hall at Edinburgh came up for discussion from time to time, but eventually a design prepared by Mr. Morham, the city architect, and Mr. J. Williamson, deputy city architect, was adopted by the committee of the town council, though the site for the building is not yet settled, some objections being still raised to the proposal to pull down the Synod Hall in Castle Terrace. The estimated cost of the hall is £78,270.

An electrical exhibition, organized under the patronage of the Institution of Electrical Engineers, and under the auspices of the National Electrical Manufacturers' Association, was held at Olympia in October.

The restoration of Abergwili Palace, which was considerably damaged by fire last year, was completed under the direction of Mr. W. D. Caröe for the Bishop of St. David's.

The Waldorf Theatre at one end of Aldwych, London, and the Hicks Theatre at the corner of Kingsway, near by, were erected, Mr. W. G. R. Sprague being the architect of both. The Scala Theatre, off Tottenham Court Road, was also completed (Mr. Frank T. Verity, architect).

LAW CASES OF THE YEAR.

Ownership of Drawings—*Gibbon v. Pease*.

—This important case was decided in the Court of Appeal on March 24th, having been taken to the higher Court from a judgment given by Mr. Justice Ridley. It concerned the retention of plans and papers in connection with the conversion of the upper parts of some houses into residential flats. The defendant was the architect for the work, which was carried out under his supervision. After the work was finished, however, the plaintiff claimed all the plans, specifications and papers prepared and used by the architect in the execution of the alterations. Defendant denied his right to such possession, contending that the plans should remain his property. In the lower Court, however, Mr. Justice Ridley had given a decision that the plans were to be handed over to the plaintiff as claimed, and this judgment was upheld by the Court of Appeal, who dismissed the present case with costs, holding that as the architect had performed his contract and been paid for it, the plans and papers were the property of the building owner. Thus the judgment in the well-known case of *Ebdy v. McGowan* was confirmed. Architects much resented the decision in this latter case, and contributions from the R.I.B.A., the Society of Architects and the Surveyors' Institution were made towards *Gibbon v. Pease*.

Right of Light—*Ambler v. the Bishop of Leeds*.—Mr. Justice Bray, sitting in the King's Bench Division, delivered his considered judgment in this case on January 20th. The plaintiff was an architect occupying an office on the first floor of some premises in Cookridge Street, Leeds, and it was contended that the light to this office was materially diminished by the erection of the new Roman Catholic Cathedral opposite. The point raised was whether an architect requiring an ordinary amount of light was entitled to include his business under the heading of "special businesses." Mr. Justice Bray, following the House of Lords' decision in *Colls v. Home and Colonial Stores*, held that, although there had been diminution of light, sufficient remained for all the purposes of the ordinary user. Judgment was therefore entered for the defendant. This case had relation to the finding of the late Mr. Thomas Blashill, who was the umpire appointed by the arbitrators in regard to the point at issue.

City Ancient Lights Case—*Higgins and Barclay, Perkins & Co., Ltd. v. Betts*.—This case was heard in the Chancery Division on May 26th. Plaintiffs were the occupants of a public-house having a frontage of 67ft. to Benjamin Street, E.C. A building on the opposite side which was only 30ft. in height was increased to 38ft., and plaintiffs' dining-room, which used to have 67 degs. of light, was left with only 32 degs. The bar and other rooms also suffered. Mr. Justice Farwell granted an injunction.

Workmen's Compensation.—A number of appeals under the Workmen's Compensation Act were heard during the year. One of the most interesting was that of *Hartley v. Quick*, heard in January. The applicant was a workman in the employment of Quick, who was a builder and contractor engaged in erecting an extension to the corporation electricity generation station at Portsmouth. The workman was injured by falling off the scaffold. At the time of the accident the walls of the new building had been carried up in places to about 20ft., but they were not anywhere connected with the station (which was more than 30ft. high), though the footings for the extension were in absolute touch with the wall of the existing building. The county-court judge held that if the two

buildings were intended ultimately to form one building, or to form two buildings to both of which a party wall was common, absolute attachment of the new to the old building was not necessary so long as the building operations were being carried on in connection with both buildings. He accordingly held that the applicant's employment came within the Act, and gave an award in his favour. The Court of Appeal upheld this decision.

Big Action against Contractors—*Plymouth Corporation v. Pethick Brothers*.—Judgment in this case was given on April 3rd after eight days' hearing in the King's Bench Division. Plaintiffs claimed £25,000 damages for alleged fraudulent misrepresentation and breach of contract for the construction of an underground sewer to take sewage out to sea at low-tide level. The pipes were to be laid in a trench and covered with concrete, and the plaintiffs alleged that, after having sent divers down, they found the work insufficiently executed, the pipes being laid on the bed and not in a trench as agreed upon. Judgment was given in their favour for £20,000 and costs.

Claim for Fees—*Maby and Another v. Lloyd and Others*, trustees of the Hearts of Oak Benefit Society.—This case was concluded on May 19th before Mr. Justice Lawrence and a special jury. The plaintiffs claimed £3,374 for fees and work done as joint architects for the Hearts of Oak Benefit Society. Defendants denied liability, on the grounds that the plaintiffs were invited to send in plans for a building the cost of which was not to exceed £55,000; that their plans having been accepted they were asked to make certain alterations; that the proposed building with the alterations could not be erected for less than £95,000; and that the plaintiffs warranted that their design with the alterations could be carried out at a cost within 10 per cent. of their original estimate. Defendants also counter-claimed for £1,240, fees they had paid to a quantity surveyor in connection with the plaintiffs' plans. After the plaintiffs had been very severely cross-examined, a formal verdict was entered for the defendants on the claim, with costs, the counter-claim being withdrawn without costs.

Contractors' Alleged Negligence—*Phillips v. Kingston, Miller & Co., Ltd.*—Mr. Justice Ridley and a special jury in the King's Bench Division concluded this case on February 8th. Mr. Lionel Phillips, of 33, Grosvenor Square, W., sued the defendants, a firm of contractors of Oxford Street, for damages caused by a fire in a temporary supper-room at the plaintiff's house, in consequence of an alleged defective electric-light installation by the defendants. Defendants denied this. Judgment in their favour was given both on claim and counter-claim.

Building Contracts.—A novel point was raised in a county-court case at Stockton in October. A Middlesbrough builder and contractor named Price sued a Stockton joiner named Mawood for £65 12s., the balance of a contract to build eight houses. The contract was a verbal one, but subsequently Mawood asked Price to put it into writing. Price could neither read nor write, and a man named Earnshaw was engaged to put the contract into writing. Earnshaw made a mistake, and Price did not find out the error until he went for the balance of the contract money. For the defence it was contended that Price could not succeed, but must take action for the rectification of the contract, and then it would have to be shown that the mistake was a mutual one. Judgment was given for Mawood, his Honour remarking that the action by Price was not that of a man who had made a mistake in a contract.

BOOKS OF THE YEAR.

Architecture.

- "A History of Architectural Development." F. M. Simpson. Vol. I. (*Longmans, Green.*)
- "Architecture, East and West." R. Phené Spiers. (*Batsford.*)
- "Gothic Architecture in England." Francis Bond. (*Batsford.*)
- "The Cathedral Builders in England." E. S. Prior. (*Seeley.*)
- "Character of Renaissance Architecture." Charles Herbert Moore. (*Macmillan.*)
- "Studies in Architecture." Reginald Blomfield. (*Macmillan.*)
- "Old and New Architecture in Khiva, Bokhara and Turkestan." O. Olufsen. (*Tofts.*)
- "A History of Architecture on the Comparative Method." Fletcher. 5th edition. (*Batsford.*)
- "Robert Adam." Percy Fitzgerald. (*Fisher Unwin.*)
- "Old Cottages, Farmhouses and other Stone Buildings in the Cotswold District." W. Galsworthy Davie and E. Guy Dawber. (*Batsford.*)
- "Somerset House." Raymond Needham & Alexander Webster. (*Fisher Unwin.*)
- "Mediæval Art." W. R. Lethaby. (*Duckworth.*)
